

Reference Manual DCM IDL

Revision 1.1011
June 19, 2013

1 D C M

General interface definition for the DCM Digital Content Manager. This document describes the interface through Corba of the DCM device.

In the [Introduction](#) you will find some explanation about the usage.

Author

Multiple.

2 Introduction

IDL call implementation.

In general commands are executed to the "up to first error" method.

- Setting values will continue until the end of the list or an invalid record is encountered. The latter case will raise an exception
- Getting values will only succeed when all filter values are correct.

Two examples:

- Calling IPS_OutTS_AddL to create new TSs, returns an OpNotSucceeded exception and returns no newly created streams if the system already has 1998 TSs and you want to add 3 more. Two streams will be added however.
- When calling the IPS_OutTS_GetL to obtain a list of outgoing TS, the BoardNr and SlotNr must exist. When a list of refs is supplied, all those refs must exist. If not an OpNotSucceeded will be raised.

DCM architecture overview

Multiplexing

- A TS is identified by a physical reference IPS_RefTS_t.
- BoardGetL_V2: Get a list of present boards in the device and their board type.
- Input: TS: IPS_InTS_GetL: Get a list of incoming transport streams Service: IPS_InServiceGetL: Get the list of services on an input TS that are currently present in the incoming transport stream or passed to an output
- Output: TS on ASI: TS always exists TS on GbE IPS_OutTS_AddL: Create a number of TSs based on board defaults IPS_OutDefaultsSet(), IPS_OutDefaultsGet() Service: IPS_OutServiceAddL: Add a list of services to one or more outgoing TSs

Scrambling

DCM scrambler configuration and configuration of parameters for communication with Conditional Access Systems (CAS) can be done using the following calls. Details of these calls are listed in scrambler.idl and are available upon request.

- Scrambling configuration
 1. Scrambler settings.
The IOP call GetScsSettings can be used to get the global scrambler settings The IOP call SetScsSettings can be used to set the global scrambler settings. This IOP call takes the same parameters the previous one returns.
 2. Proxy information.
To connect with a simulcrypt device (EIS, ECMG) a proxy needs to be created on the [DCM](#). All simulcrypt proxies have a unique identifier (proxy_id). This proxy_id is assigned to the proxy at construction time and can be used to address that specific proxy. The IOP call GetInterfaceList will return all proxy_id's currently in use. These proxy_id's are listed per proxy type.

- ECMG proxy.

1. ECMG Proxy creation.

A new ECMG proxy can be created by using the CreateEcmg IOP call. This call returns only one parameter:

- EcmgId unique identifier (proxy_id) for newly created ECMG proxy. This proxy_id needs to be used in all other IOP calls concerning this proxy. An existing ECMG proxy can be removed by using the DeleteEcmg IOP call. This call takes only one argument:
- EcmgId unique identifier (proxy_id) for ECMG proxy

2. ECMG Proxy configuration.

Once a proxy has been created, it can be configured. The current configuration can be checked using the GetEcmgConfig IOP call. An ECMG proxy can be configured by using the SetEcmgConfig IOP call.

Extra parameters can be configured for an ECMG proxy. A lot of channel specific parameters (reported by a channel_status message between ECMG and scrambler) can be overruled. - Therefore the IOP call SetEcmgOverrule can be used. This overrule configuration can be checked with the GetEcmgOverrule IOP call. Two more channel specific parameters can be overruled with the SetEcmgOverruleExt IOP call. This extra overrule configuration can be checked with the GetEcmgOverruleExt IOP call.

3. ECMG Connections.

The IOP call GetConnList will return all ConnId's currently in use for a specific ECMG proxy. This call takes only one argument:

- EcmgId unique identifier (proxy_id) for ECMG proxy And will return a list of all used ConnId's:
- ConnIds list of all ConnId's for ECMG proxy.

- ECMG connection creation.

A new connection can be created by the means of the CreateEcmgConn IOP call. An existing connection can be removed by using the DeleteEcmgConn IOP call.

- ECMG connection configuration.

Once an ECMG connection has been created, it can be configured. The current configuration can be checked using the GetEcmgConnConfig IOP call. An ECMG connection can be configured by using the SetEcmgConnConfig IOP call. This call uses the same parameters as the get call.

- Connection status.

For every connection the status can be retrieved, by using the GetEcmgConnStatus IOP call.

1. ECMG status.

The status of an ECMG proxy can be retrieved, by using the GetEcmgStatus IOP call. This call takes only one argument:

- EcmgId unique identifier (proxy_id) for ECMG proxy.

1. Descriptor rules.

Descriptor rules can be defined on proxy level. These rules can append private data to the CA descriptors. A descriptor rule needs to be created and configured. Each descriptor rule has a unique identifier (DescRuleId), which is assigned to the descriptor rule at construction time and can be used to address that specific descriptor rule.

The IIOP call GetEcmgDescList will return all DescRuleId's currently in use for a specific ECMG proxy. This call takes only one argument:

- EcmgId unique identifier (proxy_id) for ECMG proxy And will return a list of all used DescRuleId's:
- DescRuleIds list of all DescRuleId's for ECMG proxy
- Descriptor rule creation.

A new descriptor rule can be created by the means of the CreateEcmgDescriptor IIOP call. This call takes only one argument:

- EcmgId unique identifier (proxy_id) for ECMG proxy And will return one argument as well:
- DescRuleId Unique identifier for newly created descriptor rule. This DescRuleId needs to be used in all other IIOP calls concerning this proxy.

An existing descriptor rule can be removed by using the DeleteEcmgDescriptor IIOP call.

- Descriptor rule configuration.

Once descriptor rule has been created, it can be configured. The current configuration can be checked using the GetEcmgDescriptor IIOP call. This call takes two arguments:

- EcmgId unique identifier (proxy_id) for ECMG proxy.
- DescRuleId unique identifier for descriptor rule.

A descriptor rule can be configured by using the SetEcmgDescriptor IIOP call. This call uses the same parameters as the get call.

1. Hot backup configuration

The connection to an ECMG can be denied for inactive devices. To enable this feature a setting on the ECMG proxy must be reset. This setting can be adapted using the SetHotEcmgConnection IIOP call. This call takes the following arguments:

- EcmgId unique identifier (proxy_id) for ECMG proxy
- bBackupHotStandby flag to indicate whether hot standby (inactive device establishes connection to ECMG) must be enabled or not

This setting can be checked by using the GetHotEcmgConnection IIOP call. This call uses the same parameters as the set call.

- EMMG proxy

1. EMMG Proxy creation. A new EMMG proxy can be created by using the CreateEmmg IIOP call. This call returns only one parameter:

- EmmgId unique identifier (proxy_id) for newly created EMMG proxy. This proxy_id needs to be used in all other IIOP calls concerning this proxy.

An existing EMMG proxy can be removed by using the DeleteEmmg IIOP call. This call takes only one argument:

- EmmgId unique identifier (proxy_id) for EMMG proxy.

1. EMMG Proxy configuration. Once a proxy has been created, it can be configured. The current configuration can be checked using the GetEmmgConfig IIOP call. This call takes only one argument:

- EmmgId unique identifier (proxy_id) for ECMG proxy. An ECMG proxy can be configured by using the SetEmmgConfig IIOP call. This call uses the same parameters as the get call.

1. EMMG status. The status of an EMMG proxy can be retrieved, by using the GetEmmgStatus IIOP call. This call takes only one argument:

- EmmgId unique identifier (proxy_id) for EMMG proxy.

1. Descriptor rules. Descriptor rules can be defined on proxy level. These rules can append private data to the CA descriptors in the CAT. A descriptor rule needs to be created and configured. - Each descriptor rule has a unique identifier (DescRuleId), which is assigned to the descriptor rule at construction time and can be used to address that specific descriptor rule.

The IIOP call GetEmmgDescList will return all DescRuleId's currently in use for a specific EMMG proxy. This call takes only one argument:

- EmmgId unique identifier (proxy_id) for EMMG proxy. And will return a list of all used DescRuleId's:
- DescRuleIds list of all DescRuleId's for EMMG proxy.
- Descriptor rule creation. A new descriptor rule can be created by the means of the CreateEmmgDescriptor IIOP call. This call takes only one argument:
 - EmmgId unique identifier (proxy_id) for EMMG proxy And will return one argument as well:
 - DescRuleId Unique identifier for newly created descriptor rule. This DescRuleId needs to be used in all other IIOP calls concerning this proxy.

An existing descriptor rule can be removed by using the DeleteEmmgDescriptor IIOP call. This call takes two arguments:

- EmmgId unique identifier (proxy_id) for EMMG proxy.
- DescRuleId unique identifier for descriptor rule.
- Descriptor rule configuration. Once descriptor rule has been created, it can be configured. The current configuration can be checked using the GetEmmgDescriptor IIOP call. This call takes two arguments:
 - EmmgId unique identifier (proxy_id) for EMMG proxy.
 - DescRuleId unique identifier for descriptor rule.A descriptor rule can be configured by using the SetEmmgDescriptor IIOP call. This call uses the same parameters as the get call.

- EIS proxy.

1. Proxy creation. A new EIS proxy can be created by using the CreateEis IIOP call. This call returns only one parameter:
 - EisId unique identifier (proxy_id) for newly created EIS proxy. This proxy_id needs to be used in all other IIOP calls concerning this proxy.

An existing EIS proxy can be removed by using the DeleteEis IIOP call. This call takes only one argument:

- EisId unique identifier (proxy_id) for EIS proxy.

1. Proxy configuration. Once a proxy has been created, it can be configured. The current configuration can be checked using the GetEisConfig IIOP call. This call takes only one argument:

- EisId unique identifier (proxy_id) for EIS proxy. An EIS proxy can be configured by using the SetEisConfig IIOP call. This call uses the same parameters as the get call.
1. EIS status. The status of an EIS proxy can be retrieved, by using the GetEisStatus IIOP call. This call takes only one argument:
 - EisId unique identifier (proxy_id) for EIS proxy. And will return the following parameters:
 - EisConnectionState status of connection.
 - ConnectionPeer IP address of connected EIS.

For historical reasons a second IIOP call, GetEisStatusEx, exists which will return the same and additional parameters. This call takes again only one argument:

- EisId unique identifier (proxy_id) for EIS proxy And will return the following parameters:
 - EisConnectionState status of connection.
 - ConnectionPeer IP address of connected EIS.
 - NbrOfChannels number of connections to EIS.
 - PSIG proxy.
1. Proxy creation. A new PSIG proxy can be created by using the CreatePsig IIOP call. This call returns only one parameter:
 - PsigId unique identifier (proxy_id) for newly created PSIG proxy. This proxy_id needs to be used in all other IIOP calls concerning this proxy.

An existing PSIG proxy can be removed by using the DeletePsig IIOP call. This call takes only one argument:

- PsigId unique identifier (proxy_id) for PSIG proxy.
1. Proxy configuration Once a proxy has been created, it can be configured. The current configuration can be checked using the GetPsigConfig IIOP call. This call takes only one argument:
 - PsigId unique identifier (proxy_id) for PSIG proxy.

A PSIG proxy can be configured by using the SetPsigConfig IIOP call. This call uses the same parameters as the get call.

1. PSIG status. The status of a PSIG proxy can be retrieved, by using the GetPsigStatus IIOP call. This call takes only one argument:
 - PsigId unique identifier (proxy_id) for PSIG proxy.

Transrating

There are 3 kinds of TR groups (defined in the IDL by the enum: eTR_GroupType):

- (Single TS) MPTS All services. TR group associated with a single TS. All services of that TS are automatically part of the TR group. There can only be one such a TR group associated with a TS.

- (Single TS) MPTS Selective services. TR group associated with a single TS. A sub set of output services can be part of the TR group. There can be mulitple TR groups of this type associated with the same output TS.
- Multi TS TR group. TR group associated with multiple SPTS (SPTS only, no MPTS allowed).

A TS can only be associated with 1 type of TR group (e.g. it is not possible to have a MPTS All Services and MPTS Selective Services TR group associated with the same output TS, or it is not possible that an output TS is associated with a MPTS selective services TR group while part of a Mulit TS TR group).

TR group Identification: A TR group is identified by a GroupID (TR_GroupID_t). All actions conserning TR groups must specify the Group ID to target the correct TR group.

(Single TS) MPTS All Services TR group:

- Create: TR_GroupAddL, TR_TS_AddL
- Delete: TR_GroupDeleteL
- Add new Services: When a service a added to the TS the service is automatically added to the TR group
- Remove Services: When a service is removed from the output the service is automaticaaly removed from the TR group There is no need to remove the output services from the TR group first when deleting the TR group.

(Single TS) MPTS Selective Services TR group:

- Create: TR_GroupAddL
- Delete: TR_GroupDeleteL
- Add output service to the TR group (Service must exist at the output): TR_ServiceAddL
- Remove existing output service from the TR group but not from the output TS: TR_ServiceDeleteL
Remove existing output service from the output TS: When a service is removed from the output TS the service is automatically removed from the TR group There is no need to remove the output services from the TR group first when deleting the TR group
- Create: TR_GroupAddL
- Delete: TR_GroupDeleteL
- Add SPTS (SPTS must exist at the output): TR_TS_AddL
- Remove SPTS from the TR group but not from the output: TR_TS_DeleteL
- Remove SPTS from the output: When a TS is removed from the output the TS is automatically removed from the TR group No need to remove the TS from the TR group before removal of the TR group itself

3 Deprecated List

Member **DCM::DeviceControl::ASI_DTF_Change** (in IPS_Ref_t RefPhys, in ASI_DTF_OutputTS-t OutputTS)

Obsoleted in release 6.0

Member [DCM::DeviceControl::ASI_DTF_GetKeyList](#) (in [IPS_Ref_t RefPhys](#))

Obsoleted in release 6.0

Member [DCM::DeviceControl::ASI_DTF_List_t](#)

Obsoleted by [ASI_DTF_ListEx_t](#) from release 6.0

Class [DCM::DeviceControl::ASI_DTF_OutputTS_t](#)

Obsoleted by [ASI_DTF_OutputTS_Ex_t](#) from release 6.0

Member [DCM::DeviceControl::ASI_DTF_OutTS_Get](#) (in [IPS_Ref_t RefPhys](#))

Obsoleted in release 6.0

Member [DCM::DeviceControl::ASI_DTF_ScramblingKeyList](#)

Obsoleted in release 6.0

Class [DCM::DeviceControl::ASI_DTF_ScramblingKeyPair_t](#)

Obsoleted in release 6.0

Member [DCM::DeviceControl::ASI_DTF_SetKeyList](#) (in [IPS_Ref_t RefPhys](#), in [ASI_DTF_ScramblingKeyList KeyList](#))

Obsoleted in release 6.0

Class [DCM::DeviceControl::ASI_DTF_t](#)

Obsoleted by [ASI_DTF_Ex_t](#) from release 6.0

Member [DCM::DeviceControl::BoardCfgGetL](#) (in unsigned short [BoardNumber](#), in [PortList_t PortList](#))

Use [BoardCfg_V2_GetL](#) instead.

Member [DCM::DeviceControl::BoardCfgSet](#) (in [BoardCfg_t BoardCfg](#))

Use [BoardCfg_V2_Set](#) instead.

Member [DCM::DeviceControl::CreateMCryptEis](#) (out unsigned long [EisId](#))

This call should not be used (replace by call [CreateEis](#))

Member [DCM::DeviceControl::CreateMCryptPsig](#) (out unsigned long [PsigId](#))

This call should not be used (replace by call [CreatePsig](#))

Member [DCM::DeviceControl::DeleteMCryptEis](#) (in unsigned long [EisId](#))

This call should not be used (replace by call [DeleteEis](#))

Member [DCM::DeviceControl::DeleteMCryptPsig](#) (in unsigned long [PsigId](#))

This call should not be used (replace by call [DeletePsig](#))

Member [DCM::DeviceControl::DescrCAM_CfgGetL](#) (in [IPS_Ref_t CamRef](#), out [DescrCAM_Cfg_List_t ConfigList](#))

Since release 12.0, use [DescrCAM_CfgGetL_V2](#) instead

Member [DCM::DeviceControl::DescrCAM_CfgSetL](#) (in unsigned short [BoardNr](#), in [DescrCAM_Cfg_List_t ConfigList](#))

Since release 12.0, use [DescrCAM_CfgSetL_V2](#) instead

Member [DCM::DeviceControl::DescrTS_GetL](#) (in unsigned short [BoardNr](#), in [IPS_RefTS_List_t RefTsList](#), out [DescrTS_Data_List_t TsDataList](#))

Since Release 12.0, use [DescrTS_GetL_V2](#) instead

Member [DCM::DeviceControl::DescrTS_SetL](#) (in unsigned short [BoardNr](#), in [DescrTS_Data_List_t TsDataList](#))

Since Release 12.0, user [DescrTS_SetL_V2](#) instead

Class [DCM::DeviceControl::DPI_SpliceRequestTime_t](#)

Obsoleted in release 11.0

Member [DCM::DeviceControl::DPI_SRT_Get](#) (in [IPS_Ref_t](#) RefPhys)

Obsoleted in release 11.0

Member [DCM::DeviceControl::DPI_SRT_Set](#) (in [IPS_Ref_t](#) RefPhys, in [DPI_SpliceRequestTime_t](#) SpliceRequestTime)

Obsoleted in release 11.0

Member [DCM::DeviceControl::eTimeBaseSelectionMode](#)

Use V2 structure instead

Member [DCM::DeviceControl::eTR_Delay](#)

This enum should not be used anymore since R5.01.

Member [DCM::DeviceControl::GetConnList](#) (in unsigned long EcmgId, out IdList ConnIds)

This call should not be used anymore since release 8.9 (replaced by call [GetEcmgConnList](#))

Member [DCM::DeviceControl::GetCwgConnConfig](#) (in unsigned long CwgId, in unsigned long - ConnId, out unsigned long IpAddress, out unsigned short Port, out unsigned short ChannelId, out long Priority)

This call should not be used anymore since release 10.10 (replaced by call [GetCwgConnConfig_V2](#))

Member [DCM::DeviceControl::GetDefaultTimeBaseSelectionMode](#) (in unsigned short Board-Number, out eTimeBaseSelectionMode TBS_Mode)

Since version 10.30, use [GetDefaultTBSMode_V2](#) instead

Member [DCM::DeviceControl::GetEcmgBackup](#) (in unsigned long EcmgId, out boolean Backup-Revertive, out long RevertTime, out boolean HotStandby)

This call should not be used on [DCM](#).

Member [DCM::DeviceControl::GetEcmgConfig](#) (in unsigned long EcmgId, out string Name, out eEcmgType EcmgType, out unsigned short CasId, out unsigned short SubCasId, out eEcmPidSource EcmPidSource, out unsigned short EcmPidLowerLimit, out unsigned short EcmPidUpperLimit, out eEcmgChannelIdMode EcmgChannelIdMode)

This call should not be used anymore since release 8.9 (replaced by call [GetEcmgConfig_V2](#))

Member [DCM::DeviceControl::GetEcmgConnConfig](#) (in unsigned long EcmgId, in unsigned long ConnId, out unsigned long IpAddress, out unsigned short Port, out unsigned short ChannelId, out long Priority)

This call should not be used anymore since release 10.10 (replaced by call [GetEcmgConnConfig_V2](#))

Member [DCM::DeviceControl::GetEcmgDescriptor](#) (in unsigned long EcmgId, in unsigned long - DescRuleId, out string DescRuleName, out eEcmgDescRuleType Type, out eDescInsertionLevel InsertionLevel, out string DescriptorData, out EcmIdList EcmIds)

This call should not be used anymore since release 8.1 (replaced by call [GetEcmgDescriptor_V2](#))

Member [DCM::DeviceControl::GetEisStatus](#) (in unsigned long EisId, out eConnectionState Eis-ConnectionState, out unsigned long ConnectionPeer)

This call should not be used anymore since release 10.10 (replaced by call [GetEisStatus_V2](#))

Member [DCM::DeviceControl::GetEmmgStatus](#) (in unsigned long EmmgId, out eConnectionState EmmgConnectionState, out unsigned long NoOfOpenStreams, out unsigned long Current-Bandwidth, out unsigned long ConnectionPeer)

This call should not be used anymore since release 10.10 (replaced by call [GetEmmgStatus_V2](#))

Member **DCM::DeviceControl::GetPsigStatus** (in unsigned long PsigId, out eConnectionState Psig-ConnectionState, out unsigned long NoOfStreams, out unsigned long CurrentBandwidth, out unsigned long ConnectionPeer)

This call should not be used anymore since release 10.10 (replaced by call GetPsigStatus_V2)

Member **DCM::DeviceControl::GetSettingsRestoreOptions** (out RestoreOptions options)

Use GetSettingsRestoreOptions_V2 instead

Member **DCM::DeviceControl::GetSI_Generation** (in IPS_RefTS_t OutRefTS, out Table-GenerationDataList_t TableSettings)

Member **DCM::DeviceControl::GetSystemType** (out eSystemType Type)

Deprecated since version 9.0, use GetSystemType_V2 instead

Member **DCM::DeviceControl::GetVideoClockSync** (in unsigned short SlotNumber, out boolean b-UseExtRef)

Member **DCM::DeviceControl::InTS_TimeBaseSelectionMode_List_t**

Use V2 structure instead

Class **DCM::DeviceControl::InTS_TimeBaseSelectionMode_t**

Use V2 structure instead

Member **DCM::DeviceControl::IPS_GBE_RatesGet** (in IPS_Ref_t RefPhys, out GbEStatistics_t -Stats)

Use IPS_GBE_RatesGetL instead.

Member **DCM::DeviceControl::IPS_GBE_StatisticsGet** (in IPS_Ref_t RefPhys, out GbEStatistics_t Stats)

Use IPS_GBE_StatisticsGetL instead.

Member **DCM::DeviceControl::SetCwgConnConfig** (in unsigned long CwgId, in unsigned long -ConnId, in unsigned long IpAddress, in unsigned short Port, in unsigned short ChannelId, in long Priority)

This call should not be used anymore since release 10.10 (replaced by call SetCwgConnConfig_V2)

Member **DCM::DeviceControl::SetDefaultTimeBaseSelectionMode** (in unsigned short Board-Number, in eTimeBaseSelectionMode TBS_Mode)

Since version 10.30, use SetDefaultTBSMode_V2 instead

Member **DCM::DeviceControl::SetDeviceAsBackup** (in boolean bIsBackup)

This call should not be used anymore since release 4.0. Instead, SetDeviceActiveMode should be used.

Member **DCM::DeviceControl::SetEcmgBackup** (in unsigned long EcmgId, in boolean Backup-Revertive, in long RevertTime, in boolean HotStandby)

This call should not be used on DCM.

Member **DCM::DeviceControl::SetEcmgConfig** (in unsigned long EcmgId, in string Name, in e-EcmgType EcmgType, in unsigned short CasId, in unsigned short SubCasId, in eEcmPidSource EcmPidSource, in unsigned short EcmPidLowerLimit, in unsigned short EcmPidUpperLimit, in eEcmgChannelIdMode EcmgChannelIdMode)

This call should not be used anymore since release 8.9 (replaced by call SetEcmgConfig_V2)

Member **DCM::DeviceControl::SetEcmgConnConfig** (in unsigned long EcmgId, in unsigned long -ConnId, in unsigned long IpAddress, in unsigned short Port, in unsigned short ChannelId, in long Priority)

This call should not be used anymore since release 10.10 (replaced by call SetEcmgConnConfig_V2)

Member **DCM::DeviceControl::SetEcmgDescriptor** (in unsigned long EcmgId, in unsigned long - DescRuleId, in string DescRuleName, in eEcmgDescRuleType Type, in eDescInsertionLevel - InsertionLevel, in string DescriptorData, in EcmIdList EcmIds)

This call should not be used anymore since release 8.1 (replaced by call SetEcmgDescriptor_V2)

Member **DCM::DeviceControl::SetSettingsRestoreOptions** (in RestoreOptions options)

Use SetSettingsRestoreOptions_V2

Member **DCM::DeviceControl::SetVideoClockSync** (in unsigned short SlotNumber, in boolean b- UseExtRef)

Class **DCM::DeviceControl::TC_Video_t**

The types TC_VideoDecode_t and TC_VideoEncode_t should be used instead of this type.

Member **DCM::DeviceControl::TC_VideoCfgDeleteL** (in unsigned short BoardNr, in TC_Service- TrackingID_List_t ToDelete)

Use TC_VideoDecodeCfgDeleteL(..) and TC_VideoEncodeCfgDeleteL(..) instead.

Member **DCM::DeviceControl::TC_VideoCfgGetL** (in unsigned short BoardNr, in IPS_Service_- List_t ServiceList, out TC_VideoCfgList_t VideoCfgList)

Use TC_VideoDecodeCfgGetL(..) and TC_VideoEncodeCfgGetL(..) instead.

Member **DCM::DeviceControl::TC_VideoCfgSetL** (in unsigned short BoardNr, in TC_VideoCfg- List_t VideoCfgList)

Use TC_VideoDecodeCfgSetL(..) and TC_VideoEncodeCfgSetL(..) instead.

Class **DCM::DeviceControl::TC_VideoSettings_t**

The types TC_VideoEncodeSettings_t, TC_VideoDecode_t and TC_VideoEncode_t should be used instead of this type and TC_Video_t.

Member **DCM::DeviceControl::TimeBaseSelectionMode_GetL** (in IPS_Ref_t RefPhys, in IPS_Ref- TS_List_t RefTsList, out InTS_TimeBaseSelectionMode_List_t TBS_List)

Since version 10.30, use TimeBaseSelectionMode_V2_GetL instead

Member **DCM::DeviceControl::TimeBaseSelectionMode_SetL** (in IPS_Ref_t RefPhys, in InTS_- TimeBaseSelectionMode_List_t TBS_List)

Since version 10.30, use TimeBaseSelectionMode_V2_SetL instead

Class **DCM::DeviceControl::TimeBaseSelectionMode_t**

Use V2 structure instead

Member **DCM::DeviceControl::TR_GetBoardDelay** (in IPS_Ref_t RefPhys, out eTR_Delay TR_- Delay)

This call should not be used anymore since R5.01 (replaced by call TR_GetBoardDelayExtend)

Member **DCM::DeviceControl::TR_GetBoardDelayExtend** (in IPS_Ref_t RefPhys, out TR_Delay- Mode_t TR_Delay)

This call should not be used anymore since R08.09 (replaced by call TR_SetBoardDelayExtend_V2)

Member **DCM::DeviceControl::TR_SetBoardDelay** (in IPS_Ref_t RefPhys, in eTR_Delay TR_- Delay)

This call should not be used anymore since R5.01 (replaced by call TR_SetBoardDelayExtend)

Member **DCM::DeviceControl::TR_SetBoardDelayExtend** (in IPS_Ref_t RefPhys, in TR_Delay- Mode_t TR_Delay)

This call should not be used anymore since R08.09 (replaced by call TR_GetBoardDelayExtend_V2)

Group **IGMPv2**

Use the IGMPv3 calls, they also support IGMP protocol v2 (use Exclude filter with no members). These calls are scheduled for removal in v6.00

4 Module Index

4.1 Modules

Here is a list of all modules:

Time management	39
Client coordinator functions	49
SNMP specific	58
General board configuration calls	62
Logging facilities on the DCM	69
Application Specific Configuration management	72
Multiplexing	92
TS	94
Service	164
Pid	191
PortConfig	216
8-VSB	231
DVB-S2	236
Descriptors	251
Compact CA Descriptor settings	261
Others	265

6 Class Index

6.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

DCM::DeviceControl::AC_t	
Access Criteria	1257
DCM::DeviceControl::AddPidsFromSplice_t	1257
DCM::DeviceControl::AlarmTriggerRule_t	1258
DCM::DeviceControl::AlternateSource_t	
A definition of an alternate source	1260
DCM::DeviceControl::AlternateSourceSettings_t	
All the settings concerning alternate sources for one output service	1261
DCM::DeviceControl::AltSrcBU_Setting_t	1261
DCM::DeviceControl::AltSrcMergeActiveInSvc_t	1262
DCM::DeviceControl::AltSrcMergedSetting_t	1263
DCM::DeviceControl::ArpEntry_t	1264
DCM::DeviceControl::ASI_BW_LimitData_t	1265
DCM::DeviceControl::ASI_DTF_Ex_t	
Structure holding DTF input settings. The difference with the ASI_DTF_t structure is that this structure here doesn't hold the scrambling key directly. Instead, it holds a reference to a key in the list that can be set up using the ASI_DTF_SetKeyList method. Also the scrambling type can be selected to be odd or even	1266
DCM::DeviceControl::ASI_DTF_OutputTS_Ex_t	
Structure holding DTF output settings. The difference with the ASI_DTF_OutputTS_t is that this structure here provides for scrambling type, scrambling key indices and the possibility to overrule the input-level settings by one global setting	1268
DCM::DeviceControl::ASI_DTF_OutputTS_RDCS_t	
Structure holding DTF RDCS output settings. From V9.0 onwards	1269
DCM::DeviceControl::ASI_DTF_OutputTS_t	
Structure holding DTF output settings	1270
DCM::DeviceControl::ASI_DTF_RDCS_t	
Structure holding DTF RDCS input settings. From V9.0 onwards	1271
DCM::DeviceControl::ASI_DTF_ScramblingKey_t	1271
DCM::DeviceControl::ASI_DTF_ScramblingKeyPair_t	
Structure holding DTF scrambling keys	1272
DCM::DeviceControl::ASI_DTF_t	
Structure holding DTF input settings	1273

DCM::DeviceControl::ASI_MirrorCfg_t	1275
Structure to define port mirroring for ASI	
DCM::DeviceControl::ASI_SFN_MKII_MDP_MultiplicationSettings_t	1276
DCM::DeviceControl::ASI_SFN_MKII_RDCS_Settings_t	1276
DCM::DeviceControl::ASI_SFN_MKII_TS_Output_Mode_t	1277
DCM::DeviceControl::AsiFormatData_t	1278
Structure to set ASI format and output mode	
DCM::DeviceControl::BackupService_t	1279
DCM::DeviceControl::BackupSrvTable_t	1281
DCM::DeviceControl::BannerCfg_t	1281
DCM::DeviceControl::BannerCfg_V2_t	1283
DCM::DeviceControl::BitrateAlarmSetting_t	1285
Structure to pass payload and stuffing bitrate threshold alarm settings	
DCM::DeviceControl::BitRateMeasurement_t	1286
General structure to hold bitrate measurement data	
DCM::DeviceControl::BoardBitrateThreshold	1287
The bitrate threshold for video, audio and data service losses (board specific)	
DCM::DeviceControl::BoardCfg_t	1288
Structure to get or set port information	
DCM::DeviceControl::BoardCfg_V2_t	1290
Structure to get or set port information	
DCM::DeviceControl::BoardDejitterCfg_t	1291
DCM::DeviceControl::BoardFeatureUsage_t	1292
Contains the feature usage per board	
DCM::DeviceControl::BoardIdentification	1292
Information data as returned by <code>GetSystemId()</code>	
DCM::DeviceControl::BoardInfo_t	1293
Structure to return board configuration	
DCM::DeviceControl::BoardInfo_V2_t	1294
Structure to return board configuration	
DCM::DeviceControl::BoardTemperature_t	1295
DCM::DeviceControl::ClearPidBitrates_t	1296
DCM::DeviceControl::CofTrigger_t	1297
Structure used in the configuration of the triggers for card not operational failure alarms	

DCM::DeviceControl::Color_t	1298
DCM::DeviceControl::CompactCaMode_t Compact CA descriptor setting (per input TS)	1299
DCM::DeviceControl::ComponentMergeCriterium_t	1300
DCM::DeviceControl::ComponentTag_t	1301
DCM::DeviceControl::ComponentTemperature_t	1302
DCM::DeviceControl::ComponentTrackRule_t	1303
DCM::DeviceControl::ComponentTrackRule_V2_t	1305
DCM::DeviceControl::CompPidES_t Identification of muxed pids	1305
DCM::DeviceControl::CompPidES_V2_t	1307
DCM::DeviceControl::DCG_3D_pair_t	1308
DCM::DeviceControl::DCG_AES_GeneratorConfig_t	1309
DCM::DeviceControl::DCG_AudioPairInfo_t	1309
DCM::DeviceControl::DCG_AudioSignalInfo_t Describes the audio signal information	1310
DCM::DeviceControl::DCG_BackupStream_t	1311
DCM::DeviceControl::DCG_CompressionEnable_t	1312
DCM::DeviceControl::DCG_GeneratorConfig_t	1313
DCM::DeviceControl::DCG_HitlessSwitchOverEnable_t	1314
DCM::DeviceControl::DCG_InputRTP_Stream_t Prior to version 9.10: Between 10 and 100 (default 60) A sequence of DCG_InputTS_t entries	1315
DCM::DeviceControl::DCG_InputRTP_Stream_V2_t Prior to version 9.10: Between 10 and 100 (default 60)	1316
DCM::DeviceControl::DCG_InputRTP_Stream_V3_t Prior to version 9.10: Between 10 and 100 (default 60)	1317
DCM::DeviceControl::DCG_InputTS_t Information of an incoming TS	1318
DCM::DeviceControl::DCG_JP2K_params_t	1319
DCM::DeviceControl::DCG_JP2K_params_V2_t	1320
DCM::DeviceControl::DCG_JP2K_params_V3_t	1321
DCM::DeviceControl::DCG_OutputFecGBE_t	1322

DCM::DeviceControl::DCG_OutputGBE_t	1322
DCM::DeviceControl::DCG_OutputRTP_Stream_t	1323
DCM::DeviceControl::DCG_OutputRTP_V2_Stream_t	1324
DCM::DeviceControl::DCG_OutputTS_t Information-Settings of an outgoing TS	1325
DCM::DeviceControl::DCG_Possible3GBoardCfg_t	1326
DCM::DeviceControl::DCG_StreamBackupParams_t	1327
DCM::DeviceControl::DCG_VBI_Defs_t	1327
DCM::DCM_Notifications Description of all external notifications	1328
DCM::DCM_Notifications::DCM_TsIdOnIdChange Notification sent by IO when an alarm configured as trigger changes current state (alarms) No parameters given	1329
DCM::DeviceControl::Debug_DvbS2_InputTS_t Information about a DVBS2 input TS, including the hardware index	1330
DCM::DeviceControl::Debug_Gbe_InputTS_t	1332
DCM::DeviceControl::Debug_Gbe_OutputTS_t Information-Settings of an outgoing TS	1332
DCM::DeviceControl::DefaultAutoPassRules Default Service component behaviour	1333
DCM::DeviceControl::DefaultTrackRule_t Structure for board default component tracking rules	1334
DCM::DeviceControl::DescrBISS_Cfg_t Configuration of BISS descrambling	1335
DCM::DeviceControl::DescrCAM_BackupCfg_t Structure used to configure CAM backup	1337
DCM::DeviceControl::DescrCAM_Cfg_t Defines the configuration of the CAM itself	1338
DCM::DeviceControl::DescrCAM_Cfg_V2_t Defines the configuration of the CAM itself	1339
DCM::DeviceControl::DescrCAM_Status_t Structure containing information about a CAM	1340
DCM::DeviceControl::DescriptorData_t	1341
DCM::DeviceControl::DescriptorRule_t	1342
DCM::DeviceControl::DescriptorRuleSet_t	1342

DCM::DeviceControl::DescrResource_t	1343
Structure containing identification information about the descrambling resource	
DCM::DeviceControl::DescrServiceData_t	1344
A structure with attributes of the service routed to the descrambler	
DCM::DeviceControl::DescrSvcConfig_t	1345
Defines how the service is descrambled	
DCM::DeviceControl::DescrTrackingRule_t	1346
Defines a tracking rule for descrambling, including the BISS session word	
DCM::DeviceControl::DescrTS_Data_t	1347
Structure with data of a TS added to a descrambler	
DCM::DeviceControl::DescrTS_Data_V2_t	1349
Structure with data of a TS added to a descrambler	
DCM::DeviceControl::DeviceBackupLink_t	1350
Configuration of a link between 2 devices for use with Device Backup	
DCM::DeviceControl::DeviceBackupParams_t	1351
DCM::DeviceControl::DeviceBackupParamsV2_t	1352
Following combinations of Roles and Modes are valid:	
DCM::DeviceCallback	1353
DCM::DeviceControl	1353
The only interface of DCM to the outside world	
DCM::DeviceControl::DPI_ChannelName_t	1505
A spliceable channel name	
DCM::DeviceControl::DPI_ChannelSettings2_t	1506
DCM::DeviceControl::DPI_ChannelSettings3_t	1507
DCM::DeviceControl::DPI_ChannelSettings_t	1508
DCM::DeviceControl::DPI_ChannelStatus_t	1509
DCM::DeviceControl::DPI_CueRequest_t	1509
DCM::DeviceControl::DPI_PidCouple_t	1510
DCM::DeviceControl::DPI_PmtSpliceModeSetting_t	1511
Struct to set/get ePMT_SpliceMode per channel	
DCM::DeviceControl::DPI_ShortChannelStatus_t	1512
DCM::DeviceControl::DPI_SpliceRequest_t	1513
DCM::DeviceControl::DPI_SpliceRequestTime_t	1514
A splice request is supposed to arrive a few seconds in advance of the actual splice time	

DCM::DeviceControl::DPI_Time_t	
UTC since jan 1 1970	1515
DCM::DeviceControl::DvbS2_InputTS_t	
DvbS2 information of an incoming DVB-S2 input stream	1516
DCM::DeviceControl::DvbS2_LookupTS_t	
Structure to find a specific TS by port and input stream identifier	1517
DCM::DeviceControl::DvbS2_RefTS_t	
Structure containing the looked-up transport stream for a given lookupTS	1517
DCM::DeviceControl::EasConfig_t	
Represents the configuration of an EAS proxy	1518
DCM::DeviceControl::EMM_Data_t	
Identification of EMMG EMMs	1520
DCM::DeviceControl::End2End_Delay_t	1521
DCM::DeviceControl::EndDeviceEntry_t	1522
DCM::DeviceControl::ES_TypeSetting_t	1522
DCM::DeviceControl::EsEntry_t	1523
DCM::DeviceControl::ETTV_ContentData_t	
Structure that contains status about the Content of an ETTV	1524
DCM::DeviceControl::ETTV_ContentSetting_t	
Structure combining service-id with settings	1525
DCM::DeviceControl::ETV_ApplicationIdent_t	1526
DCM::DeviceControl::ETV_EissFilter_t	1527
DCM::DeviceControl::ETV_Insertion_Settings_t	1528
DCM::DeviceControl::ETV_Insertion_Settings_V2_t	1529
DCM::DeviceControl::ETV_ManipulationSettings_t	1530
DCM::DeviceControl::ETV_ManipulationSettings_V2_t	1531
DCM::DeviceControl::ETV_Primary_Settings_t	1532
DCM::DeviceControl::ETV_Primary_Settings_V2_t	1533
DCM::DeviceControl::ExtIpServiceCtrl	1533
DCM::DeviceControl::FCS_Scte35_CommandSelect_t	1534
DCM::DeviceControl::Feature_t	1535
DCM::DeviceControl::FeatureUsage_t	
Represents the license usage count per feature	1536

DCM::DeviceControl::FEC_Dec_Setting_t	
FEC decoder settings	1537
DCM::DeviceControl::FEC_Dec_Statistics_t	
FEC decoder statistics	1538
DCM::DeviceControl::FEC_Dec_Status_t	
FEC decoder status	1539
DCM::DeviceControl::FEC_Enc_ErrorGen_t	
FEC error generation parameters	1541
DCM::DeviceControl::FEC_Enc_Overhead_t	
Bitrate overhead, due to FEC encoding	1541
DCM::DeviceControl::FEC_Enc_Setting_t	
FEC encoder settings	1542
DCM::DeviceControl::FEC_Enc_Setting_V2_t	
FEC encoder settings	1543
DCM::DeviceControl::FontCfg_t	1544
DCM::DeviceControl::ForbiddenPidRange_t	1545
DCM::DeviceControl::GbEFramesRecv_t	1546
DCM::DeviceControl::GbEFramesTrans_t	1548
DCM::DeviceControl::GbEIO_IP_Settings_t	1550
DCM::DeviceControl::GbEPortStatsEntry_t	1551
DCM::DeviceControl::GbEStatisticsEntry_t	1552
DCM::DeviceControl::GPI_Settings_t	1553
DCM::DeviceControl::GPI_StatusControl_t	1554
DCM::DeviceControl::GPS_Settings_t	1555
DCM::DeviceControl::GPS_Status_t	1556
DCM::DeviceControl::HitlessMergeSetting_t	
Hitless merge input TS settings	1557
DCM::DeviceControl::IGMPv2MulticastGroup_t	1558
DCM::DeviceControl::IGMPv3Group_t	1559
DCM::DeviceControl::IIOP_SubTable_t	
Structure containing the properties a SubTable provisioned via IIOP	1559
DCM::DeviceControl::InEMM_Ref_t	
Identification of which PID to be created/deleted. Note this is duplicated by RefPid_t but must remain for backwards compatability	1560

DCM::DeviceControl::InPID_Data_t	1562
Identification of which PID to be (un)blocked	
DCM::DeviceControl::InPort_8VSB_Config_t	1563
Represents the 8VSB input port specific settings	
DCM::DeviceControl::InPort_8VSB_Statistics_t	1564
Defines the statistics that can be retrieved per 8VSB input port	
DCM::DeviceControl::InPort_8VSB_TuningParams_t	1565
Tuning parameters for an 8VSB input port	
DCM::DeviceControl::InPort_DvbS2_Counters_t	1567
Structure containing the different counters per DVB S2 port	
DCM::DeviceControl::InPort_DvbS2_LncCfg_t	1568
Structure used to configure the DVB S2 LNC	
DCM::DeviceControl::InPort_DvbS2_PortConfig_t	1569
Structure used to configure single stream or multi-stream mode per port	
DCM::DeviceControl::InPort_DvbS2_Status_t	1569
Structure used to retrieve status information of a DVB S2 port	
DCM::DeviceControl::InPort_DvbS2_TunerCfg_t	1571
Structure used to configure the DVB S2 tuner	
DCM::DeviceControl::InTS_AES_Statistic_t	1573
DCM::DeviceControl::InTS_CompactCaMode_t	1574
Compact CA descriptor settings for specific TS	
DCM::DeviceControl::InTS_FEC_Dec_DefRuleSetting_t	1575
FEC decoder default rule settings	
DCM::DeviceControl::InTS_FEC_Dec_Setting_t	1576
FEC encoder settings for specific TS	
DCM::DeviceControl::InTS_FEC_Dec_Statistics_t	1576
FEC decoder statistics for specific TS	
DCM::DeviceControl::InTS_FEC_Dec_Status_t	1577
FEC decoder status for specific TS	
DCM::DeviceControl::InTS_HitlessMergeSetting_t	1578
Hitless merge settings for specific TS	
DCM::DeviceControl::InTS_IPI_Settings_t	1579
Information to change the IndexPacketInterpreter settings of an incoming TS	
DCM::DeviceControl::InTS_PriorityBit_t	1580
Information to change the priority bit of the MPEG packets of an incoming TS	
DCM::DeviceControl::InTS_Statistic_t	1581
DCM::DeviceControl::InTS_TimeBaseSelectionMode_t	1582

DCM::DeviceControl::InTS_TimeBaseSelectionMode_V2_t	1583
DCM::DeviceControl::InTsExistenceReasons_t Input Transport stream reason for existence bitmap	1584
DCM::DeviceControl::IP_Route_t	1586
DCM::DeviceControl::IP_Route_t_V2	1587
DCM::DeviceControl::IP_Subnet_t	1588
DCM::DeviceControl::IpCfg_t	1588
DCM::DeviceControl::IPI_Settings_t	1589
DCM::DeviceControl::IPS_ChangeInputTS_t Information to change an incoming TS	1590
DCM::DeviceControl::IPS_Gbe_InputTS_t Gbe information of an incoming TS	1591
DCM::DeviceControl::IPS_In_ECMSettings_t	1592
DCM::DeviceControl::IPS_In_ESSettings_t	1593
DCM::DeviceControl::IPS_In_ServiceComponents_t	1594
DCM::DeviceControl::IPS_InPID_Data_t	1595
DCM::DeviceControl::IPS_InPID_Data_V2_t	1596
DCM::DeviceControl::IPS_InputTS_t Information of an incoming TS	1597
DCM::DeviceControl::IPS_LanguageSettings_t	1598
DCM::DeviceControl::IPS_LookupTS_t Structure to find a specific TS by IP-address and UDP port	1599
DCM::DeviceControl::IPS_MergedInService_t	1600
DCM::DeviceControl::IPS_Out_ECMSettings_t	1601
DCM::DeviceControl::IPS_Out_ESSettings_t	1602
DCM::DeviceControl::IPS_Out_ESSettings_V2_t	1603
DCM::DeviceControl::IPS_Out_PIDSettings_t	1604
DCM::DeviceControl::IPS_Out_ServiceComponents_t	1605
DCM::DeviceControl::IPS_Out_ServiceComponents_V2_t	1606
DCM::DeviceControl::IPS_OutPID_Data2_t	1606
DCM::DeviceControl::IPS_OutPID_Data_t Used for PID passing by IPS_OutPID_AddL(), IPS_OutPID_GetL() and IPS_OutPID- _DeleteL()	1608

DCM::DeviceControl::IPS_OutPID_Sync_t	1609
DCM::DeviceControl::IPS_OutPID_Sync_V2_t	1609
DCM::DeviceControl::IPS_OutputTS_LT_t	1610
DCM::DeviceControl::IPS_OutputTS_LT_V2_t	1611
DCM::DeviceControl::IPS_OutputTS_t	1612
DCM::DeviceControl::IPS_OutputTS_V2_t Information-Settings of an outgoing TS	1613
DCM::DeviceControl::IPS_OutServiceSync_t	1614
DCM::DeviceControl::IPS_OutServiceSync_V2_t	1615
DCM::DeviceControl::IPS_OutTS_RTP_t	1615
DCM::DeviceControl::IPS_Ref_t General location of a physical or virtual port	1616
DCM::DeviceControl::IPS_ReferenceTS_t Structure to find a specific TS by IP-address and UDP port	1617
DCM::DeviceControl::IPS_RefPid_t Note RefPid_t is effectively a copy of InEMM_Ref_t but that must remain for compatibility	1618
DCM::DeviceControl::IPS_RefSvc_t A reference to a service	1619
DCM::DeviceControl::IPS_RefTS_t General location of a TS	1620
DCM::DeviceControl::IPS_SDT_Data_t Structure that contains data about the Service Description Table of a service	1621
DCM::DeviceControl::IPS_Serv_Dest_t	1623
DCM::DeviceControl::IPS_Service_In_t Incoming service information	1624
DCM::DeviceControl::IPS_Service_In_V2_t A definition of an input service as used on the output	1625
DCM::DeviceControl::IPS_Service_t SID reference	1627
DCM::DeviceControl::IPS_ServiceData_Out_t	1628
DCM::DeviceControl::IPS_ServiceData_Out_V2_t Extended information about an output service	1629
DCM::DeviceControl::IPS_ServiceData_Out_V3_t Extended information about an output service	1630

DCM::DeviceControl::IPS_UDP_Socket_t	
The socket describes the IP address & UDP port on which a TS is played out	1631
DCM::DeviceControl::IPSecHost	1631
DCM::DeviceControl::IpServiceDisplayData	
Description of an active or listening port	1632
DCM::DeviceControl::JclInitialValue_t	
JCL initial value for Hitachi	1634
DCM::DeviceControl::JclSystemId_t	
JCL system ID for Hitachi	1634
DCM::DeviceControl::LicenseValidation_t	1635
DCM::DeviceControl::LogoCfg_t	1636
DCM::DeviceControl::LogoCfgFileNumber_t	1638
DCM::DeviceControl::MaximumLogoSize_t	1638
DCM::DeviceControl::MergeCriterium_t	1639
DCM::DeviceControl::MergedESDescriptorData_t	1640
DCM::DeviceControl::MessageBufferInfo	1641
DCM::DCM_Notifications::Messages	
Notification sent by MB when a new message is available (alarms)	1642
DCM::DeviceControl::MessageSetting	
Message settings	1643
DCM::DeviceControl::MFPB_AAC_AudioSettings_t	
AAC audio processing settings	1644
DCM::DeviceControl::MFPB_AacAudioCfg_t	
Configuration settings for the AAC audio settings of a service	1645
DCM::DeviceControl::MFPB_AudioDecode_t	
Audio decode settings together with fields identifying the Audio component they're for	1646
DCM::DeviceControl::MFPB_AudioDecodeCfg_t	1647
DCM::DeviceControl::MFPB_AudioDecodeExtraAACCfg_t	
Configuration for extra AAC decoder settings per service	1648
DCM::DeviceControl::MFPB_AudioDecodeExtraAACSettings_t	
Extra AAC decoder settings per audio ES	1649
DCM::DeviceControl::MFPB_AudioDecodeExtraDolbyCfg_t	
Configuration for extra Dolby decoder settings per service	1650
DCM::DeviceControl::MFPB_AudioDecodeExtraDolbySettings_t	
Extra Dolby decoder settings per audio ES	1651

DCM::DeviceControl::MFPB_AudioDecodeExtraMPEGL2Cfg_t	1653
Configuration for extra MPEG1-L2 decoder settings per service	
DCM::DeviceControl::MFPB_AudioDecodeExtraMPEGL2Settings_t	1653
Extra MPEG1-L2 decoder settings per audio ES	
DCM::DeviceControl::MFPB_AudioEncode_t	1654
Audio encode settings together with field identifying the Audio component they're for	
DCM::DeviceControl::MFPB_AudioEncodeCfg_t	1655
DCM::DeviceControl::MFPB_AudioEncodeSettings_t	1656
Audio encode settings	
DCM::DeviceControl::MFPB_AudioInformation_t	1658
DCM::DeviceControl::MFPB_AudioServiceInformation_t	1658
DCM::DeviceControl::MFPB_AudioStatus_t	1659
DCM::DeviceControl::MFPB_BoardCfg_t	1660
Structure to set/get transcoder board configuration	
DCM::DeviceControl::MFPB_Component_t	1661
DCM::DeviceControl::MFPB_DD_MetaDecStatus_t	1662
Dolby meta data status on the decoder side for a specific component	
DCM::DeviceControl::MFPB_DD_MetaStatus_t	1663
Dolby meta data status for a specific component	
DCM::DeviceControl::MFPB_Dolby_AudioSettings_t	1666
Dolby audio processing settings	
DCM::DeviceControl::MFPB_Dolby_AudioSettings_V2_t	1668
Dolby audio processing settings	
DCM::DeviceControl::MFPB_DolbyAudioCfg_t	1671
Configuration settings for the Dolby audio settings of a service	
DCM::DeviceControl::MFPB_DolbyAudioCfg_V2_t	1672
Configuration settings for the Dolby audio settings of a service	
DCM::DeviceControl::MFPB_EngineUnitCfg_t	1673
DCM::DeviceControl::MFPB_ES_CaptionInfo_t	1673
Configuration settings for the Caption Service Descriptor of an ES	
DCM::DeviceControl::MFPB_MetaDataCfg_t	1674
Audio meta data settings for a specific component	
DCM::DeviceControl::MFPB_MPEG2FramePicturesCfg_t	1675
DCM::DeviceControl::MFPB_MPEGL2_AudioSettings_t	1676
MPEG1-L2 audio processing settings	

DCM::DeviceControl::MFPB_MPEGL2AudioCfg_t	
Configuration settings for the MPEG1-L2 audio settings of a service	1677
DCM::DeviceControl::MFPB_MultiResABR_t	
Note: it is required that FragmentLength and SegmentLength are a multiple of one another	1678
DCM::DeviceControl::MFPB_MultiResVideoEncode_t	
MultiRes video encode settings together with field identifying the video component they're for	1680
DCM::DeviceControl::MFPB_MultiResVideoEncodeCfg_t	1681
DCM::DeviceControl::MFPB_MultiResVideoEncodeSettings_t	
MultiResolution Video encode settings	1681
DCM::DeviceControl::MFPB_ServiceCfg_t	1683
DCM::DeviceControl::MFPB_ServiceComponents_t	1684
DCM::DeviceControl::MFPB_ServiceDD_MetaDecStatus_t	
Dolby meta data status on the decoder side for a specific service	1685
DCM::DeviceControl::MFPB_ServiceMetaDataCfg_t	
Audio meta data settings for a specific service	1686
DCM::DeviceControl::MFPB_ServiceTrackingID_t	1687
DCM::DeviceControl::MFPB_Svc_CaptionInfo_t	
Configuration settings for the Caption Service Descriptor(s) of a service	1688
DCM::DeviceControl::MFPB_VideoDecode_t	
Video decode settings together with fields identifying the video component they're for	1688
DCM::DeviceControl::MFPB_VideoDecodeCfg_t	1689
DCM::DeviceControl::MFPB_VideoEncode_t	
Video encode settings together with field identifying the video component they're for	1690
DCM::DeviceControl::MFPB_VideoEncodeCfg_t	1691
DCM::DeviceControl::MFPB_VideoEncodeCfgV2_t	1692
DCM::DeviceControl::MFPB_VideoEncoderTemplate_t	1693
DCM::DeviceControl::MFPB_VideoEncodeSettings_t	
Video encode settings	1694
DCM::DeviceControl::MFPB_VideoEncodeSettingsV2_t	
Video encode settings	1696
DCM::DeviceControl::MFPB_VideoEncodeV2_t	
Video encode settings together with field identifying the video component they're for	1698
DCM::DeviceControl::MFPB_VideoInformation_t	1698
DCM::DeviceControl::MFPB_VideoResolution_t	1699

DCM::DeviceControl::MFPB_VideoServiceInformation_t	1700
DCM::DeviceControl::MFPB_VideoStatus_t	1701
DCM::DeviceControl::MIP_Settings_t	1701
DCM::DeviceControl::MIP_SyncTargetSettings_t	1703
DCM::DeviceControl::MM_ID_t	
Alarm reference (M&M, 1:1 device backup)	1703
DCM::DeviceControl::MM_Measurement	1705
DCM::DeviceControl::MM_MeasurementStat	1705
DCM::DeviceControl::MM_Message	1706
DCM::DeviceControl::MM_MessageMainPart	
Structure to pass Messages from the device to whatever client	1707
DCM::DeviceControl::MM_MessageSetting	
Measurement message settings	1709
DCM::DeviceControl::MM_MessageTypeErrorInterval	1709
DCM::DeviceControl::MM_MessageTypeSetting	
Message type settings	1710
DCM::DeviceControl::MM_TypeInfo	1711
DCM::DeviceControl::MM_TypeInfo_V2	
V2 of MM_TypeInfo : BackupTriggerMethod is added	1712
DCM::DeviceControl::ModuleExceptionTrace_t	
Structure to get or set Debug Trace Level information	1713
DCM::DeviceControl::MultipleStringElement_t	1713
DCM::DeviceControl::MultipleStringSegment_t	
Multiple String: ATSC string representation	1714
DCM::DeviceControl::NegotiatedGbePortSpeed_t	1715
DCM::DeviceControl::NicTeam_MemberStatus_t	
Structure describing the status of a NIC team member	1716
DCM::DeviceControl::NicTeam_Settings	
Structure to get or set NIC team configuration	1717
DCM::DeviceControl::NicTeamStatus	
Structure to get NIC team status	1718
DCM::DeviceControl::NotifData_t	1719
DCM::DeviceControl::NTP_Info_t	1720
DCM::DeviceControl::NTP_Stats_t	1721

DCM::DCM_Notifications::Output_SI_TableChng	
Notification sent when a Table is added (starts streaming) or changed	1722
DCM::DCM_Notifications::Output_SI_TableDel	
Notification sent when a Table is deleted (stops streaming)	1724
DCM::DCM_Notifications::Output_TS_Change	1725
DCM::DCM_Notifications::Output_TS_Delete	
Notification sent when a TS is deleted (removed from DCM)	1726
DCM::DeviceControl::OutputTsLossTriggerBitmapPerTs_t	1727
DCM::DeviceControl::OutputTsLossTriggerPerTs_t	1728
DCM::DeviceControl::OutTS_AlarmSetting_t	
Structure to pass payload and stuffing bitrate threshold alarm settings to one specific TS	1728
DCM::DeviceControl::OutTS_FEC_Enc_DefSetting_t	
Default FEC encoder settings (to be applied for new TS's)	1729
DCM::DeviceControl::OutTS_FEC_Enc_ErrorGen_t	
FEC error generation for specific TS	1730
DCM::DeviceControl::OutTS_FEC_Enc_Overhead_t	
Bitrate overhead for specific TS	1731
DCM::DeviceControl::OutTS_FEC_Enc_Setting_t	
FEC encoder settings for specific TS	1732
DCM::DeviceControl::OutTS_FEC_Enc_Setting_V2_t	
FEC encoder settings for specific TS	1733
DCM::DeviceControl::OutTS_InsertCATDescriptors_t	1734
DCM::DeviceControl::OutTS_NitInPat_t	
NIT in PAT setting for specific TS	1735
DCM::DeviceControl::OutTS_PsipEitStartPid_t	1736
DCM::DeviceControl::OutTS_PsipEttStartPid_t	1736
DCM::DeviceControl::OutTS_PsipEttvPid_t	1737
DCM::DeviceControl::OutTS_SrcAddr_t	
Source Address parameters for an OutTS	1738
DCM::DeviceControl::OutTS_SrcAddr_V2_t	1739
DCM::DeviceControl::OutTS_SttTimeZone_t	
Transport stream specific STT time zone setting	1740
DCM::DeviceControl::OutTS_TOS_t	1741
DCM::DeviceControl::OutTS_TTL_t	1742
DCM::DeviceControl::OutTS_UdpSize_t	1743

DCM::DeviceControl::OutTS_VBR_t	1744
DCM::DeviceControl::OutTS_VLAN_t	1745
DCM::DeviceControl::OutTsServiceLocationAdded_t Transport stream specific "Service Location Added" setting parameters	1746
DCM::DeviceControl::OutTsStandard_t Transport stream specific Output TS Standard setting parameters	1747
DCM::DeviceControl::PacketIndexerSettings_t	1748
DCM::DeviceControl::PcrSetting_t	1749
DCM::DeviceControl::PCTM_PacketCounters_t Packet counter values	1751
DCM::DeviceControl::PCTM_StreamPacketCounters_t Packet counters of one stream	1752
DCM::DeviceControl::PCTM_StreamThresholdSettings_t Threshold settings for the packet types of one stream	1752
DCM::DeviceControl::PCTM_ThresholdValues_t Threshold settings	1753
DCM::DeviceControl::PortFilter_t	1754
DCM::DeviceControl::PortTsSvcProps_t	1755
DCM::DeviceControl::PriorityBitMode_t Compact CA descriptor setting (per input TS)	1756
DCM::DeviceControl::PSIGSubTable_t Structure that describes a PSIG provision	1757
DCM::DeviceControl::PsipMgtInfo_t	1759
DCM::DeviceControl::PsipUpdateLocation_t	1759
DCM::DeviceControl::PsipUpdateRule_t Definition of a PsipUpdate Rule Rule: number uniquely defining a rule 0: Add/update descriptor 2: Remove descriptor (this list should be updated when more rules are supported) RuleName: actual meaning of the rule (see above) Location: 0x02, 0xFFFFFFF: PMT 0xCB, start-time: PsipEIT event RuleData: extra data of rule in readable form (UTF-8): Add/update descriptor: new descriptor in hex-string	1760
DCM::DeviceControl::Ref_SI_table_ext_t	1761
DCM::DeviceControl::RefProcessorEngineUnit_t Identify a processing engine unit of a processor board	1762
DCM::DeviceControl::ResourcesLoad_t Resource loads	1763
DCM::DeviceControl::RestoreOption Single settings restore option	1764

DCM::DeviceControl::RestoreOption_V2	
Single settings restore option	1765
DCM::DeviceControl::RipBoardSettings	1766
DCM::DeviceControl::RipInterfaceSettings	1767
DCM::DeviceControl::RipSettings_t	1768
DCM::DeviceControl::RipTsSettings_t	1769
DCM::DeviceControl::RMX_GroupSettings_t	
Realignment Mux group settings	1770
DCM::DeviceControl::RMX_GroupSvc_t	
A service that is part of a Realignment Mux group	1772
DCM::DeviceControl::RMX_GroupSvcs_t	
A set of services belonging to the same Realignment Mux group	1773
DCM::DeviceControl::RoutingData_t	1774
DCM::DeviceControl::RoutingStatusRecord_t	
Structure that contains information about one error that occurred during routing file upload (pre-config - IPS_ProcessRoutingFile)	1775
DCM::DeviceControl::ScriptEntry_t	1775
DCM::DeviceControl::Scte35CommandAndData_t	
Union containing data structures of SCTE-35 commands	1776
DCM::DeviceControl::Scte35Data_DCM_input_switch_t	
The data struct for SCTE-35 command eDCM_input_switch	1778
DCM::DeviceControl::Scte35Data_Keyer_config_t	
The data struct for SCTE-35 command eKeyer_config	1778
DCM::DeviceControl::Scte35Data_Keyer_t	
The data struct for SCTE-35 command eKeyer_on_or_off	1779
DCM::DeviceControl::Scte35Data_Local_avail_t	
The data struct for SCTE-35 command eLocal_avail_enable_or_disable	1780
DCM::DeviceControl::Scte35Data_Logo_enable_t	
The data struct for SCTE-35 command eLogo_enable_or_disable	1781
DCM::DeviceControl::Scte35Data_Network_active_t	
The data struct for SCTE-35 command eNetwork_feed_active_or_inactive	1782
DCM::DeviceControl::Scte35Data_REDUS_Switch_Single_t	
The data struct for SCTE-35 command eREDUS_switch_single	1783
DCM::DeviceControl::Scte35Data_REDUS_Switch_t	
The data struct for SCTE-35 command eREDUS_switch	1784
DCM::DeviceControl::Scte35Data_Select_now_t	
The data struct for SCTE-35 command eSelect_now	1785

DCM::DeviceControl::Scte35Source_t	1786
DCM::DeviceControl::Scte35ToggleOutOfNetwork_t	1787
DCM::DeviceControl::SelectionListEntry_t	1788
DCM::DeviceControl::Service_AutoPassRules Service component behaviour	1789
DCM::DeviceControl::ServiceBackupParams2_t	1791
DCM::DeviceControl::ServiceBackupParams_t	1791
DCM::DeviceControl::ServiceBitRateMeasurement_t	1792
DCM::DeviceControl::ServiceBitRateSample_t	1793
DCM::DeviceControl::ServiceBlockCAInfo_t Outgoing service information	1794
DCM::DeviceControl::ServiceCompBitRateMeasurement_t	1795
DCM::DeviceControl::ServiceCompSettings_t	1796
DCM::DeviceControl::ServiceES_t	1798
DCM::DeviceControl::ServiceLossTrigger_t	1799
DCM::DeviceControl::ServicePIDStatus_t Identification of the service(s) to (un)block PIDs in	1800
DCM::DeviceControl::SI_AutoPassRules_t	1801
DCM::DeviceControl::SI_Table_GenerationMode_t Generation mode for SI tables	1802
DCM::DeviceControl::SI_Table_Period_t	1802
DCM::DeviceControl::SlateData_t	1803
DCM::DeviceControl::SlateService_t	1804
DCM::DeviceControl::SMX36_AlgorithmIdentifier_t	1805
DCM::DeviceControl::SMX36_Community_t	1806
DCM::DeviceControl::SMX36_Encoder_t	1807
DCM::DeviceControl::SMX36_NetworkQoS_t	1808
DCM::DeviceControl::SMX36_Pool_t	1809
DCM::DeviceControl::SMX36_Pool_V2_t	1811
DCM::DeviceControl::SMX36_StatmuxController_t	1812
DCM::DeviceControl::SMX36_VSE_CalculatedRates_t	1813

DCM::DeviceControl::SMX36_VSE_t	1814
DCM::DeviceControl::SMX36_VSE_V2_t Implemented in V9.10	1815
DCM::DeviceControl::SMX36_VSE_V3_t Implemented in V10.20	1816
DCM::DeviceControl::SMX36_VSE_V4_t Implemented in V11.00	1818
DCM::DeviceControl::SMX36_VSEBackup_t	1820
DCM::DeviceControl::SMX36_VSEBackup_V2_t	1821
DCM::DeviceControl::SMX36_VSEParams_t	1822
DCM::DeviceControl::SMX36_VSEParams_V2_t For URC mode (planned 10.20)	1823
DCM::DeviceControl::SMX_Encoder_t	1824
DCM::DeviceControl::SMX_EncRef_t	1825
DCM::DeviceControl::SMX_EncVideoBitRate_t	1826
DCM::DeviceControl::SMX_MFP_Group_Svc_t Services in a group	1826
DCM::DeviceControl::SMX_MFP_Group_SvcSettings_t Service settings within a group	1827
DCM::DeviceControl::SMX_MFP_Group_SvcSettings_V2_t Service settings within a group	1828
DCM::DeviceControl::SMX_MFP_Group_TSs_t List of TS on a Statmux group, used for deleting TS from gorup	1829
DCM::DeviceControl::SMX_MFP_Group_TSSettings_t List of TS settings on Statmux group Can be used to add/get TS to/from a group	1830
DCM::DeviceControl::SMX_MFP_GroupSettings_t Statmux group settings The Type of the SMXGroup is important concerning further behavior and meanings of the different fields	1831
DCM::DeviceControl::SMX_MFP_SvcSettings_t Statmux setting of a service	1833
DCM::DeviceControl::SMX_MFP_SvcSettings_V2_t Statmux setting of a service, Version 2	1834
DCM::DeviceControl::SMX_MFP_TsSettings_t Data linked with a TS in statmux context	1835
DCM::DeviceControl::SMX_Pool_Calculate_t	1836
DCM::DeviceControl::SMX_PoolRef_t	1837

DCM::DeviceControl::SMX_Service_t	1838
DCM::DeviceControl::SMX_ServiceRef_t	1839
DCM::DeviceControl::SMX_StatMuxPool	1840
DCM::DeviceControl::SMX_StatMuxPool_V2	1840
DCM::DeviceControl::SNMPCommunity SNMP read or write community settings	1841
DCM::DeviceControl::SrcAddr_t Structure to specify some Ip header parameters for outgoing GbE packets	1842
DCM::DeviceControl::Svc_PsipEitRegenerationInfo_t Structure combining service information with the number of regenerated PSIP-EIT subtables	1843
DCM::DeviceControl::Svc_PsipEttRegenerationInfo_t Structure combining service information with the number of regenerated PSIP-ETT subtables	1844
DCM::DeviceControl::SvcOutES_TypeSetting_t	1845
DCM::DeviceControl::SvcOutPsipUpdateRule_t	1846
DCM::DeviceControl::SvcOutStreamingSetting_t	1847
DCM::DeviceControl::Table_Sync_Info_t Structure defining the parameters for time sync via SI table acquisition	1848
DCM::DeviceControl::TableGenerationData_t	1850
DCM::DeviceControl::TableGenerationData_V2_t	1850
DCM::DeviceControl::TableKeys_t	1851
DCM::DeviceControl::TableKeysExt_t	1852
DCM::DeviceControl::TC_Audio_t	1853
DCM::DeviceControl::TC_AudioCfg_t	1854
DCM::DeviceControl::TC_AudioInformation_t	1855
DCM::DeviceControl::TC_AudioServiceInformation_t	1856
DCM::DeviceControl::TC_AudioSettings_t	1857
DCM::DeviceControl::TC_AudioStatus_t	1858
DCM::DeviceControl::TC_Banner_t	1859
DCM::DeviceControl::TC_Banner_V2_t	1860
DCM::DeviceControl::TC_BannerSettings_t	1861
DCM::DeviceControl::TC_BannerStatus_t	1862

DCM::DeviceControl::TC_BoardCfg_t	1863
DCM::DeviceControl::TC_BoardCfg_V2_t Structure to set/get transcoder board configuration	1863
DCM::DeviceControl::TC_CaptionInfo_t Configuration settings for a Closed Caption Service	1864
DCM::DeviceControl::TC_Component_t	1865
DCM::DeviceControl::TC_DependantQuestion_t	1866
DCM::DeviceControl::TC_ES_CaptionInfo_t Configuration settings for the Caption Service Descriptor of an ES	1867
DCM::DeviceControl::TC_Logo_t	1868
DCM::DeviceControl::TC_LogoCfg_t	1868
DCM::DeviceControl::TC_LogoDisplay_t	1869
DCM::DeviceControl::TC_LogoKeyerID_t	1870
DCM::DeviceControl::TC_LogoSetting_t	1871
DCM::DeviceControl::TC_Pip_t	1872
DCM::DeviceControl::TC_PipCfg_t	1872
DCM::DeviceControl::TC_PipSettings_t	1873
DCM::DeviceControl::TC_PossibleBoardCfg_t	1874
DCM::DeviceControl::TC_PossibleBoardCfg_V2_t Structure to get possible board configurations for a transcoder board	1875
DCM::DeviceControl::TC_Question_t	1876
DCM::DeviceControl::TC_ServiceBannerStatus_t	1877
DCM::DeviceControl::TC_ServiceCfg_t	1878
DCM::DeviceControl::TC_ServiceComponents_t	1879
DCM::DeviceControl::TC_ServiceData_t Structure with service data for a transcoder board	1880
DCM::DeviceControl::TC_ServiceDataV2_t Structure with service data for a transcoder board	1881
DCM::DeviceControl::TC_ServiceLogoCfgID_t	1883
DCM::DeviceControl::TC_ServiceLogoDisplay_t	1883
DCM::DeviceControl::TC_ServiceTrackingID_t	1884
DCM::DeviceControl::TC_Svc_CaptionInfo_t Configuration settings for the Caption Service Descriptor(s) of a service	1885

DCM::DeviceControl::TC_Video_t	
Video transcode settings together with fields identifying the video component they're for	1886
DCM::DeviceControl::TC_VideoCfg_t	1887
DCM::DeviceControl::TC_VideoDecode_t	
Video decode settings together with fields identifying the video component they're for	1888
DCM::DeviceControl::TC_VideoDecodeCfg_t	1889
DCM::DeviceControl::TC_VideoEncode_t	
Video encode settings together with field identifying the video component they're for	1890
DCM::DeviceControl::TC_VideoEncodeCfg_t	1891
DCM::DeviceControl::TC_VideoEncodeSettings_t	
Video encode settings	1892
DCM::DeviceControl::TC_VideoInformation_t	1894
DCM::DeviceControl::TC_VideoResolution_t	1894
DCM::DeviceControl::TC_VideoServiceInformation_t	1895
DCM::DeviceControl::TC_VideoSettings_t	
Video transcode settings	1896
DCM::DeviceControl::TC_VideoStatus_t	1898
DCM::DeviceControl::TempLicenseData	1898
DCM::DeviceControl::TierAC_t	
Access criteria for tier based scrambling	1899
DCM::DeviceControl::TierData_t	
Tier data	1900
DCM::DeviceControl::Time	
Structure to supply date and time information	1901
DCM::DeviceControl::TimeBaseSelectionMode_t	1902
DCM::DeviceControl::TimeBaseSelectionMode_V2_t	1903
DCM::DeviceControl::TOT_Timezone_t	
Structure that represents required data to construct TOT descriptor	1904
DCM::DeviceControl::TR_AudioLevel_t	1905
DCM::DeviceControl::TR_BitrateLimits_t	
Min - max bitrate boundaries used for service	1906
DCM::DeviceControl::TR_BitRateMeasurement_t	1907
DCM::DeviceControl::TR_DelayMode_t	1908
DCM::DeviceControl::TR_DelayMode_V2_t	1909

DCM::DeviceControl::TR_GroupID_t	
Used for referencing transrater staging groups	1910
DCM::DeviceControl::TR_GroupServiceSettings_t	1911
DCM::DeviceControl::TR_GroupServiceSettings_V2_t	1911
DCM::DeviceControl::TR_GroupSettings_t	
Used to create and change transrater staging groups	1912
DCM::DeviceControl::TR_ResourceCountingLoads_t	
Calculated loads on TR board available for user	1913
DCM::DeviceControl::TR_ResourceCountingSettings_t	
Settings needed to calculate different loads on TR board which can be modified by user	1914
DCM::DeviceControl::TR_Service_t	
Identifies an output service in a transrater staging context	1915
DCM::DeviceControl::TR_ServiceAudioLevel_t	1916
DCM::DeviceControl::TR_ServiceSettings_t	
Transrater specific service settings	1917
DCM::DeviceControl::TR_ServiceSettings_V2_t	
Transrater specific service settings V2	1918
DCM::DeviceControl::TR_TSAdd_t	
Used to couple output transport stream(s) to a transrater group	1919
DCM::DeviceControl::TR_TsDelay_t	
TS Delay settings	1919
DCM::DeviceControl::TR_TSSettings_t	
Represents an output transport stream in a transrater staging context	1920
DCM::DeviceControl::TrackingCriterium_t	1921
DCM::DeviceControl::TrapDestination	
SNMP trap destination settings	1922
DCM::DeviceControl::TRBitRateSample_t	1923
DCM::DeviceControl::TS_AutoPassRules	
MPTS pass through settings	1924
DCM::DeviceControl::TS_AutoPassRulesDisableFlags	
MPTS Passthrough disable flags	1925
DCM::DeviceControl::TS_BackupParams_t	1926
DCM::DeviceControl::TS_BitRateMeasurement_t	1927
DCM::DeviceControl::TS_CompBitRateMeasurement_t	1928
DCM::DeviceControl::TS_LossTrigger_t	1929

DCM::DeviceControl::TS_PsipMgtInfo_t	1930
DCM::DeviceControl::TS_SI_Table_Periods_t	1931
DCM::DeviceControl::TS_Tier_t Tier based settings	1932
DCM::DeviceControl::TS_TOT_Timezone_t Structure that represents required data to construct all TOT descriptors on a specific TS	1933
DCM::DeviceControl::TsOutSvcSourceSelection_t	1934
DCM::DeviceControl::TsPacketIndexerID_Data_t	1935
DCM::DeviceControl::UniqueDeviceId_t	1936
DCM::DeviceControl::VCT_Data_t Structure that contains settings about the Virtual Channel Table of a service	1937
DCM::DeviceControl::VCT_Forcing_t	1939
DCM::DeviceControl::VCT_SvcData_t Structure that contains status about the Virtual Channel Table of a service	1940
DCM::DeviceControl::VCT_SvcInput_t Structure that contains status about the Virtual Channel Table of a service on input	1940
DCM::DeviceControl::VCT_SvcSetting_t Structure combining service-id with settings	1941
DCM::DeviceControl::VersionInfo Version info	1942
DCM::DeviceControl::VersionParts Version number information	1943
DCM::DeviceControl::VideoSignalInfo_t	1944
DCM::DeviceControl::VLAN_Settings_t	1944
DCM::DeviceControl::VlanPortSet_t Structure to Create/Get information on Vlan PortSets	1945

7 File Index

7.1 File List

Here is a list of all files with brief descriptions:

DCM.idl This file holds the general interface definition of the DCM module	1946

8 Module Documentation

8.1 Time management

This groups functions and compounds about time.

Classes

- struct [DCM::DeviceControl::Time](#)
Structure to supply date and time information.
- struct [DCM::DeviceControl::NTP_Stats_t](#)
- struct [DCM::DeviceControl::NTP_Info_t](#)
- struct [DCM::DeviceControl::Table_Sync_Info_t](#)
Structure defining the parameters for time sync via SI table acquisition.

Typedefs

- typedef sequence< string > [DCM::DeviceControl::IP_List_t](#)
- typedef sequence< NTP_Info_t > [DCM::DeviceControl::NTP_Info_List_t](#)
- typedef sequence< Table_Sync_Info_t > [DCM::DeviceControl::Table_Sync_Info_List_t](#)
A list of [Table_Sync_Info_t](#) entries.

Enumerations

- enum [DCM::DeviceControl::eClock_Sync_Type](#) { [DCM::DeviceControl::eClock_Sync_Type_Disabled](#), [DCM::DeviceControl::eClock_Sync_Type_NTP](#), [DCM::DeviceControl::eClock_Sync_Type_DayTime](#) }
Synchronization types.
- enum [DCM::DeviceControl::eClock_Sync_Type_V2](#) { [DCM::DeviceControl::eClock_Sync_Type_Disabled_V2](#), [DCM::DeviceControl::eClock_Sync_Type_NTP_V2](#), [DCM::DeviceControl::eClock_Sync_Type_DayTime_V2](#), [DCM::DeviceControl::eClock_Sync_Type_SI_Table_V2](#), [DCM::DeviceControl::eClock_Sync_Type_Reserved1](#), [DCM::DeviceControl::eClock_Sync_Type_Reserved2](#), [DCM::DeviceControl::eClock_Sync_Type_Reserved3](#) }
Synchronization types.
- enum [DCM::DeviceControl::eNTP_TallyCodes](#) { [DCM::DeviceControl::eNTP_TC_SpaceReject](#), [DCM::DeviceControl::eNTP_TC_FalseTick](#), [DCM::DeviceControl::eNTP_TC_Excess](#), [DCM::DeviceControl::eNTP_TC_Outlyer](#), [DCM::DeviceControl::eNTP_TC_Selected](#), [DCM::DeviceControl::eNTP_TC_SysPeer](#), [DCM::DeviceControl::eNTP_TC_PPSPeer](#), [DCM::DeviceControl::eNTP_TC_Candidat](#) }
- enum [DCM::DeviceControl::eNTP_RefClockTypes](#) { [DCM::DeviceControl::eNTP_RCT_Local](#), [DCM::DeviceControl::eNTP_RCT_Unicast](#), [DCM::DeviceControl::eNTP_RCT_Broadcast](#), [DCM::DeviceControl::eNTP_RCT_Multicast](#), [DCM::DeviceControl::eNTP_RCT_Invalid](#) }

Functions

- void [DCM::DeviceControl::SetSynchronizationType](#) (in [eClock_Sync_Type](#) Type) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)
Set the synchronization type.

- void `DCM::DeviceControl::SetSynchronizationType_V2` (in `eClock_Sync_Type_V2` Type) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)
Set the synchronization type.
- void `DCM::DeviceControl::GetSynchronizationType` (out `eClock_Sync_Type` Type) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get the synchronization type.
- void `DCM::DeviceControl::GetSynchronizationType_V2` (out `eClock_Sync_Type_V2` Type) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get the synchronization type.
- void `DCM::DeviceControl::SetClock` (in Time CurrentTime, in long OffsetMinutes) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)
Set date, time and timezone.
- void `DCM::DeviceControl::SetClock2` (in Time CurrentTime, in string TimeZone) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)
Set date and time.
- Time `DCM::DeviceControl::GetClock` () raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get system date and time in the GMT timezone.
- void `DCM::DeviceControl::GetClock2` (out Time CurrentTime, out string Timezone) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get system date, time and timezone.
- void `DCM::DeviceControl::SetNTPServers` (in `IP_List_t` IPAddresses) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)
Set the list of NTP servers to be used by DCM.
- void `DCM::DeviceControl::GetNTPServers` (out `IP_List_t` IPAddresses) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get the list of NTP servers in use by DCM.
- `NTP_Info_List_t` `DCM::DeviceControl::GetNTPStatistics` () raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get the NTP statistics.
- void `DCM::DeviceControl::SetTableTimeSync` (in unsigned long MonitoringInterval, in `Table_Sync_Info_List_t` SyncList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Set the necessary parameters for time sync using SI table acquisition and syncs the time.
- void `DCM::DeviceControl::GetTableTimeSync` (out unsigned long MonitoringInterval, out `Table_Sync_Info_List_t` SyncList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get the parameters used for time sync via SI table acquisition.
- void `DCM::DeviceControl::SyncNowOnTimeTable` () raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Will force an immediate time sync by starting immediate acquisition of the configured SI Table.

8.1.1 Detailed Description

This groups functions and compounds about time.

8.1.2 Typedef Documentation

8.1.2.1 typedef sequence<string> DCM::DeviceControl::IP_List_t

Definition at line 640 of file DCM.idl.

8.1.2.2 typedef sequence<NTP_Info_t> DCM::DeviceControl::NTP_Info_List_t

Definition at line 710 of file DCM.idl.

8.1.2.3 typedef sequence<Table_Sync_Info_t> DCM::DeviceControl::Table_Sync_Info_List_t

A list of [Table_Sync_Info_t](#) entries.

Only lists with one item will be supported in first release !!

Definition at line 747 of file DCM.idl.

8.1.3 Enumeration Type Documentation

8.1.3.1 enum DCM::DeviceControl::eClock_Sync_Type

Synchronization types.

Note

On DCM you can either disable clock synchronization or you can configure NTP clock synchronization. The synchronization type `eClock_Sync_Type_DayTime` is no longer supported. Do not pass this synchronization type to [SetSynchronizationType\(\)](#) !

Enumerator:

eClock_Sync_Type_Disabled
eClock_Sync_Type_NTP
eClock_Sync_Type_DayTime

Definition at line 474 of file DCM.idl.

8.1.3.2 enum DCM::DeviceControl::eClock_Sync_Type_V2

Synchronization types.

On DCM you can:

- disable clock synchronization or
- configure NTP clock synchronization or
- configure clock synchronization using SI tables.

The synchronization type `eClock_Sync_Type_DayTime_V2` is not supported. Do not pass this synchronization type to one of the [SetSynchronizationType\(\)](#) functions!

Enumerator:

eClock_Sync_Type_Disabled_V2
eClock_Sync_Type_NTP_V2
eClock_Sync_Type_DayTime_V2 not supported
eClock_Sync_Type_SI_Table_V2
eClock_Sync_Type_Reserved1 not supported yet
eClock_Sync_Type_Reserved2 not supported yet
eClock_Sync_Type_Reserved3 not supported yet

Definition at line 492 of file DCM.idl.

8.1.3.3 enum DCM::DeviceControl::eNTP_RefClockTypes

Enumerator:

eNTP_RCT_Local
eNTP_RCT_Unicast
eNTP_RCT_Broadcast
eNTP_RCT_Multicast
eNTP_RCT_Invalid

Definition at line 681 of file DCM.idl.

8.1.3.4 enum DCM::DeviceControl::eNTP_TallyCodes

Enumerator:

eNTP_TC_SpaceReject The peer is discarded as unreachable, synchronized to this server (synch loop) or outrageous synchronization distance.
eNTP_TC_FalseTick The peer is discarded by the intersection algorithm as a falseticker.
eNTP_TC_Excess The peer is discarded as not among the first ten peers sorted by synchronization distance.
eNTP_TC_Outlier The peer is discarded by the clustering algorithm as an outlier.
eNTP_TC_Selected The peer is a survivor, but not among the first six peers sorted by synchronization distance.
eNTP_TC_SysPeer The peer has been declared the system peer and lends its variables to the system variables.
eNTP_TC_PPSPeer The peer has been declared the system peer and lends its variables to the system variables.
eNTP_TC_Candidat The peer is a survivor and a candidate for the combining algorithm.

Definition at line 669 of file DCM.idl.

8.1.4 Function Documentation

8.1.4.1 Time DCM::DeviceControl::GetClock () raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get system date and time in the GMT timezone.

Returns

Returns the current system date and time.

Exceptions

<i>TimeOut</i>	A timeout occurred during IIOP processing.
<i>OpNotSucceeded</i>	Never thrown.
<i>OpNotAllowed</i>	Not logged on.
<i>OpNotSupported</i>	Thrown if this call is not supported in the running software version.

8.1.4.2 void DCM::DeviceControl::GetClock2 (out Time *CurrentTime*, out string *Timezone*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get system date, time and timezone.

Parameters

out	<i>CurrentTime</i>	Current system date and time in local timezone.
out	<i>Timezone</i>	Current timezone.

Exceptions

<i>TimeOut</i>	A timeout occurred during IIOP processing.
<i>OpNotSucceeded</i>	Never thrown.
<i>OpNotAllowed</i>	Not logged on.
<i>OpNotSupported</i>	Thrown if this call is not supported in the running software version.

8.1.4.3 void DCM::DeviceControl::GetNTPServers (out IP_List_t *IPAddresses*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the list of NTP servers in use by DCM.

Parameters

out	<i>IPAddresses</i>	IP addresses of NTP servers.
-----	--------------------	------------------------------

Exceptions

<i>TimeOut</i>	A timeout occurred during IIOP processing.
<i>OpNotSucceeded</i>	Never thrown.
<i>OpNotAllowed</i>	Not logged on.
<i>OpNotSupported</i>	Thrown if this call is not supported in the running software version.

8.1.4.4 NTP_Info_List_t DCM::DeviceControl::GetNTPStatistics () raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the NTP statistics.

Returns

NTP_Info_List_t List with statistics per server, including the local clock (127.127.1.0).

Exceptions

<i>TimeOut</i>	A timeout occurred during IIOP processing.
<i>OpNotSucceeded</i>	If communication with the NTP server fails.
<i>OpNotAllowed</i>	Not logged on.
<i>OpNotSupported</i>	Thrown if this call is not supported in the running software version.

Note

For more information about NTP, see also
[The NTP Project](#)

8.1.4.5 void DCM::DeviceControl::GetSynchronizationType (out eClock_Sync_Type Type) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the synchronization type.

Returns

Type The synchronization method currently in use.

Exceptions

<i>Timeout</i>	A timeout occurred during IIOP processing.
<i>OpNotSucceeded</i>	in case: • an internal error occurs (e.g. DCM fails to read the file in which this setting is persistently stored). • current synchronization type is one of the types defined by eClock_Sync_Type_V2 which has no corresponding type defined by eClock_Sync_Type, e.g. eClock_Sync_Type_SI_Table_V2.
<i>OpNotAllowed</i>	Not logged on.
<i>OpNotSupported</i>	Thrown if this call is not supported in the running software version.

8.1.4.6 void DCM::DeviceControl::GetSynchronizationType_V2 (out eClock_Sync_Type_V2 Type) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the synchronization type.

Returns

Type The synchronization method currently in use.

Exceptions

<i>Timeout</i>	A timeout occurred during IIOP processing.
<i>OpNotSucceeded</i>	in case: • an internal error occurs (e.g. DCM fails to read the file in which this setting is persistently stored).
<i>OpNotAllowed</i>	Not logged on.
<i>OpNotSupported</i>	Thrown if this call is not supported in the running software version.

8.1.4.7 void DCM::DeviceControl::GetTableTimeSync (out unsigned long MonitoringInterval, out Table_Sync_Info_List_t SyncList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the parameters used for time sync via SI table acquisition.

Parameters

out	<i>Monitoring-Interval</i>	Specified the time between 2 updates of the system clock in seconds.
out	<i>SyncList</i>	Only one entry supported now. Provides info on the SI table to be used.

Exceptions

<i>TimeOut</i>	A timeout occurred during IIOP processing.
<i>OpNotSucceeded</i>	Never thrown.
<i>OpNotAllowed</i>	Not logged on.
<i>OpNotSupported</i>	Thrown if this call is not supported in the running software version.
<i>OutOfRange</i>	Never thrown.

8.1.4.8 void DCM::DeviceControl::SetClock (in Time *CurrentTime*, in long *OffsetMinutes*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)

Set date, time and timezone.

Parameters

in	<i>CurrentTime</i>	New time, specified in current timezone.
in	<i>OffsetMinutes</i>	New offset in minutes between local time zone and GMT. Range: -14 * 60 12 * 60. Must be a multiple of 60 minutes.

Exceptions

<i>TimeOut</i>	A timeout occurred during IIOP processing.
<i>OpNotSucceeded</i>	• One or more elements of CurrentTime is out of range. • OffsetMinutes is out of range.
<i>OpNotAllowed</i>	Not logged on.
<i>OpNotSupported</i>	Thrown if this call is not supported in the running software version.
<i>OutOfRange</i>	Never thrown.

8.1.4.9 void DCM::DeviceControl::SetClock2 (in Time *CurrentTime*, in string *TimeZone*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)

Set date and time.

Parameters

in	<i>CurrentTime</i>	New time, specified in current timezone.
in	<i>TimeZone</i>	New timezone name. Two different formats are allowed • <Continent>/<City>, e.g. Europe/Brussels. • <std><offset>[<dst>[<offset>]][,<rule>], e.g. "EST5:00ED-T,M3.2.0,M11.1.0" for Ottawa.

Exceptions

<i>TimeOut</i>	A timeout occurred during IIOP processing.
<i>OpNotSucceeded</i>	One or more elements of CurrentTime is out of range.
<i>OpNotAllowed</i>	Not logged on.
<i>OpNotSupported</i>	Thrown if this call is not supported in the running software version.
<i>OutOfRange</i>	Never thrown.

See also

See also The [Open](#) Group Base Specifications Issue 6, IEEE Std 1003.1, [8.3 Other Environment Variables, TZ variable.](#) for more information on the syntax of the timezone string.

8.1.4.10 void DCM::DeviceControl::SetNTPServers (in IP_List_t IPAddresses) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)

Set the list of NTP servers to be used by DCM.

Parameters

in	<i>IPAddresses</i>	IP addresses of NTP servers.
----	--------------------	------------------------------

Exceptions

<i>TimeOut</i>	A timeout occurred during IIOP processing.
<i>OpNotSucceeded</i>	Address list is empty.
<i>OpNotAllowed</i>	Not logged on.
<i>OpNotSupported</i>	Thrown if this call is not supported in the running software version.
<i>OutOfRange</i>	Never thrown.

8.1.4.11 void DCM::DeviceControl::SetSynchronizationType (in eClock_Sync_Type Type) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)

Set the synchronization type.

Parameters

in	<i>Type</i>	Specifies the synchronization method to use.
----	-------------	--

Exceptions

<i>TimeOut</i>	A timeout occurred during IIOP processing.
<i>OpNotSucceeded</i>	in case an internal error occurs (e.g. DCM fails to write to file in which this setting is persistently stored).
<i>OpNotAllowed</i>	Not logged on.
<i>OpNotSupported</i>	Thrown if this call is not supported in the running software version.
<i>OutOfRange</i>	Never thrown.

Note

eClock_Sync_Type_DayTime is no longer supported.

8.1.4.12 void DCM::DeviceControl::SetSynchronizationType_V2 (in eClock_Sync_Type_V2 *Type*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)

Set the synchronization type.

Parameters

in	<i>Type</i>	Specifies the synchronization method to use.
----	-------------	--

Exceptions

<i>TimeOut</i>	A timeout occurred during IIOP processing.
<i>OpNotSucceeded</i>	in case an internal error occurs (e.g. DCM fails to write to file in which this setting is persistently stored).
<i>OpNotAllowed</i>	Not logged on.
<i>OpNotSupported</i>	Thrown if this call is not supported in the running software version.
<i>OutOfRange</i>	Never thrown.

Note

eClock_Sync_Type_DayTime_V2 is not supported.

8.1.4.13 void DCM::DeviceControl::SetTableTimeSync (in unsigned long *MonitoringInterval*, in Table_Sync_Info_List_t *SyncList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the necessary parameters for time sync using SI table acquisition and syncs the time.

Parameters

in	<i>Monitoring-Interval</i>	Specifies the time between 2 updates of the system clock in seconds.
in	<i>SyncList</i>	Only one entry supported now. Provides info on the SI table to be used.

Exceptions

<i>TimeOut</i>	A timeout occurred during IIOP processing.
<i>OpNotSucceeded</i>	Invalid MonitoringInterval or Table_Sync_Info parameters supplied.
<i>OpNotAllowed</i>	Not logged on.
<i>OpNotSupported</i>	Thrown if this call is not supported in the running software version.
<i>OutOfRange</i>	Never thrown.

8.1.4.14 void DCM::DeviceControl::SyncNowOnTimeTable () raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Will force an immediate time sync by starting immediate acquisition of the configured SI Table.

Exceptions

<i>TimeOut</i>	A timeout occurred during IIOP processing.
<i>OpNotSucceeded</i>	When the clock sync type is not equal to eClock_Sync_Type_SI_Table_V2
<i>OpNotAllowed</i>	Not logged on.

<i>OpNotSupported</i>	Thrown if this call is not supported in the running software version.
<i>OutOfRange</i>	Never thrown.

8.2 Client coordinator functions

Methods and compounds used to register/ unregister the clients.

Classes

- struct [DCM::DeviceControl::NotifData_t](#)

Typedefs

- typedef sequence< [NotifData_t](#) > [DCM::DeviceControl::NotifList_t](#)

Enumerations

- enum [DCM::DeviceControl::ClientType](#) { [DCM::DeviceControl::Client_Gui](#), [DCM::DeviceControl::Client_Mgmt](#), [DCM::DeviceControl::Client_SIServer](#), [DCM::DeviceControl::Client_Front](#) }
- *The different client types.*
- enum [DCM::DeviceControl::eSystemStartup](#) { [DCM::DeviceControl::eSystemStartup_NotReady](#), [DCM::DeviceControl::eSystemStartup_Ready](#) }

Functions

- void [DCM::DeviceControl::LogOn](#) (in [ClientType](#) Type, in string ClientName, in string Password, in string SecurityKey, out long ClientUniqueNumber) raises (MaxClientsReached, Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Log on, needed to perform most of the operations.
- void [DCM::DeviceControl::LogOnForNotif](#) (in long ClientUniqueNumber) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Log on to the notification channel, needed to receive notifications.
- void [DCM::DeviceControl::LogOnForNotif2](#) (in long ClientUniqueNumber) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Second version of [LogOnForNotif\(\)](#): [LogOnForNotif2](#).
- void [DCM::DeviceControl::LogOnForNotif3](#) (in long ClientUniqueNumber, in ByteStream Object-Key) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Third version of [LogOnForNotif\(\)](#): [LogOnForNotif3](#).
- void [DCM::DeviceControl::Register](#) (in string ClientName, in string NotificationName) raises (-Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Register for a notification.
- void [DCM::DeviceControl::UnRegister](#) (in string ClientName, in string NotificationName) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Unregister for a notification (see [Register\(\)](#)).
- void [DCM::DeviceControl::GetNotifList](#) (out [NotifList_t](#) NotifList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get the list of available notifications.
- void [DCM::DeviceControl::LogOff](#) (in string ClientName) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Log off, stop being able to perform most of the operations.
- void [DCM::DeviceControl::IsAlive](#) () raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Check whether application is reachable via IIOP.

- `eSystemStartup DCM::DeviceControl::IsSystemReady ()` raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Check whether application is started up completely.

- `unsigned long DCM::DeviceControl::GetUptime ()` raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Return the System Uptime, this is the total running time since manufacture of the chassis.

- `void DCM::DeviceControl::GetSystemType (out eSystemType Type)` raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Make difference between possible applications running on the DCM platform.

- `void DCM::DeviceControl::GetSystemType_V2 (out eSystemType_V2 Type)` raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Make difference between possible applications running on the DCM platform.

- `void DCM::DeviceControl::GetDeviceType (out eDeviceType Type)` raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Make difference between possible device types.

- `void DCM::DeviceControl::IdentifyMe (in long Duration)` raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Make it possible to identify a DCM by the LEDs.

8.2.1 Detailed Description

Methods and compounds used to register/ unregister the clients.

8.2.2 Typedef Documentation

8.2.2.1 `typedef sequence<NotifData_t> DCM::DeviceControl::NotifList_t`

Definition at line 960 of file DCM.idl.

8.2.3 Enumeration Type Documentation

8.2.3.1 `enum DCM::DeviceControl::ClientType`

The different client types.

Enumerator:

Client_Gui

Client_Mgmt Identifies a mgmt system (should be able to receive messages)

Client_SIServer

Client_Front

Definition at line 814 of file DCM.idl.

8.2.3.2 enum DCM::DeviceControl::eSystemStartup

Enumerator:

eSystemStartup_NotReady

eSystemStartup_Ready

Definition at line 823 of file DCM.idl.

8.2.4 Function Documentation

8.2.4.1 void DCM::DeviceControl::GetDeviceType (out eDeviceType *Type*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Make difference between possible device types.

Parameters

out	<i>Type</i>	of the device
-----	-------------	---------------

Exceptions

<i>TimeOut</i>	Never thrown.
<i>OpNotSucceeded</i>	in case of A timeout occurred during IIOP processing.
<i>OpNotAllowed</i>	Never thrown.
<i>OpNotSupported</i>	Thrown if this call is not supported in the running software version.
<i>OperationFailed</i>	

Version

Supported since release 9.0

8.2.4.2 void DCM::DeviceControl::GetNotifList (out NotifList_t *NotifList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the list of available notifications.

Parameters

out	<i>NotifList</i>	list of available notifications.
-----	------------------	----------------------------------

Exceptions

<i>TimeOut</i>	Never thrown.
<i>OpNotSucceeded</i>	Internal error.
<i>OpNotAllowed</i>	Not logged on.
<i>OpNotSupported</i>	Thrown if this call is not supported in the running software version.

8.2.4.3 void DCM::DeviceControl::GetSystemType (out eSystemType *Type*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Make difference between possible applications running on the DCM platform.

Parameters

out	<i>Type</i>	of the currently running application.
-----	-------------	---------------------------------------

Exceptions

<i>TimeOut</i>	Never thrown.
<i>OpNotSucceeded</i>	in case of A timeout occurred during IIOP processing.
<i>OpNotAllowed</i>	Never thrown.
<i>OpNotSupported</i>	Thrown if this call is not supported in the running software version.

Deprecated Deprecated since version 9.0, use GetSystemType_V2 instead

8.2.4.4 void DCM::DeviceControl::GetSystemType_V2 (out eSystemType_V2 *Type*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Make difference between possible applications running on the DCM platform.

Parameters

out	<i>Type</i>	of the currently running application.
-----	-------------	---------------------------------------

Exceptions

<i>TimeOut</i>	Never thrown.
<i>OpNotSucceeded</i>	in case of A timeout occurred during IIOP processing.
<i>OpNotAllowed</i>	Never thrown.
<i>OpNotSupported</i>	Thrown if this call is not supported in the running software version.
<i>OperationFailed</i>	

Version

Supported since release 9.0

8.2.4.5 unsigned long DCM::DeviceControl::GetUptime () raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Return the System Uptime, this is the total running time since manufacture of the chassis.

Returns

unsigned long time in hours

Exceptions

<i>TimeOut</i>	Never thrown.
<i>OpNotSucceeded</i>	Thrown if there is a problem with the reading of the EEPROM
<i>OpNotAllowed</i>	Thrown if this call is not supported in the running software version and the call was made when not logged on.
<i>OpNotSupported</i>	Thrown if this call is not supported in the running software version.
<i>OperationFailed</i>	Thrown when an error occurs while reading the EEPROM, the message will contain the error

Version

Supported since release 10.0

Note

This call is only supported on D9902 devices

8.2.4.6 void DCM::DeviceControl::IdentifyMe (in long *Duration*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Make it possible to identify a [DCM](#) by the LEDs.

Parameters

in	<i>Duration</i>	number of seconds that the IdentifyMe mode should be active
----	-----------------	---

Exceptions

<i>OpNotSucceeded</i>	Never thrown.
<i>OpNotAllowed</i>	Never thrown.
<i>OpNotSupported</i>	Thrown if this call is not supported in the running software version.

8.2.4.7 void DCM::DeviceControl::IsAlive () raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Check whether application is reachable via IIOP.

This call can be made when not logged on.

Exceptions

<i>TimeOut</i>	Never thrown.
<i>OpNotSucceeded</i>	Never thrown.
<i>OpNotAllowed</i>	Thrown if this call is not supported in the running software version and the call was made when not logged on.
<i>OpNotSupported</i>	Thrown if this call is not supported in the running software version.

8.2.4.8 eSystemStartup DCM::DeviceControl::IsSystemReady () raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Check whether application is started up completely.

This is added for management systems that only want to log on when the system is started up completely to avoid startup effects like boards not present yet. This call can be made when not logged on.

Returns

eSystemStartup the current startup state

Exceptions

<i>TimeOut</i>	Never thrown.
<i>OpNotSucceeded</i>	Never thrown.
<i>OpNotAllowed</i>	Thrown if this call is not supported in the running software version and the call was made when not logged on.
<i>OpNotSupported</i>	Thrown if this call is not supported in the running software version.

8.2.4.9 void DCM::DeviceControl::LogOff (in string *ClientName*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Log off, stop being able to perform most of the operations.

Parameters

in	<i>ClientName</i>	(not used anymore).
----	-------------------	---------------------

Exceptions

<i>TimeOut</i>	Never thrown.
<i>OpNotSucceeded</i>	Never thrown.
<i>OpNotAllowed</i>	Not logged on.
<i>OpNotSupported</i>	Thrown if this call is not supported in the running software version.

8.2.4.10 void DCM::DeviceControl::LogOn (in ClientType *Type*, in string *ClientName*, in string *Password*, in string *SecurityKey*, out long *ClientUniqueNumber*) raises (MaxClientsReached, TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Log on, needed to perform most of the operations.

Parameters

in	<i>Type</i>	type of client (use always Client_Gui).
in	<i>ClientName</i>	
in	<i>Password</i>	
in	<i>SecurityKey</i>	(not used).
out	<i>ClientUnique-Number</i>	can be used to identify this client.

Exceptions

<i>TimeOut</i>	Never thrown.
<i>OpNotSucceeded</i>	in case of • A timeout occurred during IIOP processing. • Invalid parameters.
<i>OpNotAllowed</i>	Already logged on.
<i>OpNotSupported</i>	Thrown if this call is not supported in the running software version.
<i>MaxClientsReached</i>	No more free connections left.

Note

failure in this request causes the connection to be ended.

For version prior to v08.05, username "guest", password "guest" always worked. For v08.05 and above, use one of the OS accounts that have IIOP access.

8.2.4.11 void DCM::DeviceControl::LogOnForNotif (in long *ClientUniqueNumber*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Log on to the notification channel, needed to receive notifications.

Parameters

in	<i>ClientUnique-Number</i>	now used to specify the portnumber for receiving notifications, originally, this was used to link the notification channel to the request channel.
----	----------------------------	--

Exceptions

<i>TimeOut</i>	Never thrown.
<i>OpNotSucceeded</i>	in case of • A timeout occurred during IIOP processing. • Invalid parameters.
<i>OpNotAllowed</i>	Not logged on.
<i>OpNotSupported</i>	Thrown if this call is not supported in the running software version.

Note

failure in this request causes the connection to be ended.

original version of LogOnForNotif:

- new connection for each notification
- notifications don't contain an object key

8.2.4.12 void DCM::DeviceControl::LogOnForNotif2 (in long *ClientUniqueNumber*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Second version of [LogOnForNotif\(\)](#): LogOnForNotif2.

Parameters

in	<i>ClientUnique-Number</i>	now used to specify the portnumber for receiving notifications, originally, this was used to link the notification channel to the request channel.
----	----------------------------	--

Exceptions

<i>TimeOut</i>	Never thrown.
<i>OpNotSucceeded</i>	in case of • A timeout occurred during IIOP processing. • Invalid parameters.
<i>OpNotAllowed</i>	Not logged on.
<i>OpNotSupported</i>	Thrown if this call is not supported in the running software version.

Note

failure in this request causes the connection to be ended.

second version of LogOnForNotif:

- fixed tcp-connection for sending over notifications (issue seen in DCCM with multiple connections)
- notifications don't contain an object key

originally put in for internal notifications in DCM

8.2.4.13 void DCM::DeviceControl::LogOnForNotif3 (in long *ClientUniqueNumber*, in ByteStream *ObjectKey*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Third version of [LogOnForNotif\(\)](#): LogOnForNotif3.

Parameters

in	<i>ClientUnique-Number</i>	now used to specify the portnumber for receiving notifications, originally, this was used to link the notification channel to the request channel.
in	<i>ObjectKey</i>	object key expected in the notification.

Exceptions

<i>TimeOut</i>	Never thrown.
<i>OpNotSucceeded</i>	in case of • A timeout occurred during IIOP processing. • Invalid parameters.
<i>OpNotAllowed</i>	Not logged on.
<i>OpNotSupported</i>	Thrown if this call is not supported in the running software version.

Note

failure in this request causes the connection to be ended.

second version of LogOnForNotif:

- fixed tcp-connection for sending over notifications (issue seen in DCCM with multiple connections)
- notifications contain an object key, specified in this operation

originally put in for sending notifications to an omniORB notification server

8.2.4.14 void DCM::DeviceControl::Register (in string *ClientName*, in string *NotificationName*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Register for a notification.

A notification will always be sent to all registered clients, except when the notification is triggered by an IDL-operation, in which case the caller won't receive the notification

Parameters

in	<i>ClientName</i>	(not used anymore).
in	<i>Notification-Name</i>	name of the notification that the client would like to receive.

Exceptions

<i>TimeOut</i>	Never thrown.
<i>OpNotSucceeded</i>	in case of • A timeout occurred during IIOP processing. • unknown notification.
<i>OpNotAllowed</i>	Not logged on.
<i>OpNotSupported</i>	Thrown if this call is not supported in the running software version.

8.2.4.15 void DCM::DeviceControl::UnRegister (in string *ClientName*, in string *NotificationName*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Unregister for a notification (see [Register\(\)](#)).

Parameters

in	<i>ClientName</i>	(not used anymore).
in	<i>Notification-Name</i>	name of the notification that the client would like to stop receiving.

Exceptions

<i>TimeOut</i>	Never thrown.
<i>OpNotSucceeded</i>	in case of • A timeout occurred during IIOP processing. • unknown notification.
<i>OpNotAllowed</i>	Not logged on.
<i>OpNotSupported</i>	Thrown if this call is not supported in the running software version.

8.3 SNMP specific

Classes

- struct [DCM::DeviceControl::TrapDestination](#)
SNMP trap destination settings.
- struct [DCM::DeviceControl::SNMPCommunity](#)
SNMP read or write community settings.

Typedefs

- typedef sequence< [TrapDestination](#) > [DCM::DeviceControl::TrapDestinationList](#)
A sequence of [TrapDestination](#) entries.
- typedef sequence< [SNMPCommunity](#) > [DCM::DeviceControl::SNMPCommunityList](#)
A sequence of [SNMPCommunity](#) entries.
- typedef sequence< string > [DCM::DeviceControl::IPAddressList](#)
SNMP host access restrictions (actually a list of strings.).

Enumerations

- enum [DCM::DeviceControl::SNMPOperationRights](#) { [DCM::DeviceControl::SNMP_ReadOnly](#), [DCM::DeviceControl::SNMP_ReadWrite](#) }
SNMP permission settings.

Functions

- [TrapDestinationList](#) [DCM::DeviceControl::GetSNMPTrapDest](#) () raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get the list of SNMP trap destinations.
- void [DCM::DeviceControl::AddSNMPTrapDest](#) (in [TrapDestination](#) Destination) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Either add a new or modify an existing SNMP trap destination.
- void [DCM::DeviceControl::RemoveSNMPTrapDest](#) (in string IPAddress) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Remove the specified SNMP trap destination.
- [SNMPCommunityList](#) [DCM::DeviceControl::GetSNMPCommunities](#) () raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get all configured SNMP communities.
- void [DCM::DeviceControl::AddSNMPCommunity](#) (in [SNMPCommunity](#) Community) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)
Add a new SNMP community or modify an existing SNMP community.
- void [DCM::DeviceControl::RemoveSNMPCommunity](#) (in string Community) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)
Remove one SNMP Community entry.
- void [DCM::DeviceControl::SetSNMP_MystroTrapsEnabled](#) (in boolean bEnabled) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)
Enable/Disable sending of Mystro MIB traps (addservice etc)
- void [DCM::DeviceControl::GetSNMP_MystroTrapsEnabled](#) (out boolean bEnabled) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Query whether sending of Mystro MIB traps is enabled.

8.3.1 Typedef Documentation

8.3.1.1 typedef sequence<string> DCM::DeviceControl::IPAddressList

SNMP host access restrictions (actually a list of strings.).

Definition at line 1214 of file DCM.idl.

8.3.1.2 typedef sequence<SNMPCommunity> DCM::DeviceControl::SNMPCommunityList

A sequence of [SNMPCommunity](#) entries.

Definition at line 1170 of file DCM.idl.

8.3.1.3 typedef sequence<TrapDestination> DCM::DeviceControl::TrapDestinationList

A sequence of [TrapDestination](#) entries.

Definition at line 1119 of file DCM.idl.

8.3.2 Enumeration Type Documentation

8.3.2.1 enum DCM::DeviceControl::SNMPOperationRights

SNMP permission settings.

Enumerator:

SNMP_ReadOnly

SNMP_ReadWrite

Definition at line 1156 of file DCM.idl.

8.3.3 Function Documentation

8.3.3.1 void DCM::DeviceControl::AddSNMPCommunity (in SNMPCommunity *Community*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)

Add a new SNMP community or modify an existing SNMP community.

Exceptions

<i>TimeOut</i>	A timeout occurred during IIOP processing.
<i>OpNotSucceeded</i>	Never thrown.
<i>OpNotAllowed</i>	Not logged on.
<i>OpNotSupported</i>	Thrown if this call is not supported in the running software version.
<i>OutOfRange</i>	Thrown if the community string is empty or if another value has been specified for the community rights than SNMP_ReadOnly or SNMP_ReadWrite.

8.3.3.2 void DCM::DeviceControl::AddSNMPTrapDest (in TrapDestination *Destination*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Either add a new or modify an existing SNMP trap destination.

Exceptions

<i>TimeOut</i>	A timeout occurred during IIOP processing.
<i>OpNotSucceeded</i>	Never thrown.
<i>OpNotAllowed</i>	Not logged on.
<i>OpNotSupported</i>	Thrown if this call is not supported in the running software version.

8.3.3.3 void DCM::DeviceControl::GetSNMP_MystroTrapsEnabled (out boolean *bEnabled*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Query whether sending of Mystro MIB traps is enabled.

Parameters

out	<i>bEnabled</i>	The return value.
-----	-----------------	-------------------

Exceptions

<i>TimeOut</i>	A timeout occurred during IIOP processing.
<i>OpNotSucceeded</i>	Never thrown.
<i>OpNotAllowed</i>	Not logged on.
<i>OpNotSupported</i>	Thrown if this call is not supported in the running software version.

8.3.3.4 SNMPCommunityList DCM::DeviceControl::GetSNMPCommunities () raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get all configured SNMP communities.

Exceptions

<i>TimeOut</i>	A timeout occurred during IIOP processing.
<i>OpNotSucceeded</i>	Never thrown.
<i>OpNotAllowed</i>	Not logged on.
<i>OpNotSupported</i>	Thrown if this call is not supported in the running software version.

8.3.3.5 TrapDestinationList DCM::DeviceControl::GetSNMPTrapDest () raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the list of SNMP trap destinations.

Exceptions

<i>TimeOut</i>	A timeout occurred during IIOP processing.
<i>OpNotSucceeded</i>	Never thrown.
<i>OpNotAllowed</i>	Not logged on.
<i>OpNotSupported</i>	Thrown if this call is not supported in the running software version.

8.3.3.6 void DCM::DeviceControl::RemoveSNMPCommunity (in string *Community*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)

Remove one SNMP Community entry.

Exceptions

<i>TimeOut</i>	A timeout occurred during IIOP processing.
<i>OpNotSucceeded</i>	Thrown if the specified community was not added before via AddSNMP-Community() .
<i>OpNotAllowed</i>	Not logged on.
<i>OpNotSupported</i>	Thrown if this call is not supported in the running software version.
<i>OutOfRange</i>	Thrown if the community string is empty or if another value has been specified for the community rights than SNMP_ReadOnly or SNMP_ReadWrite.

8.3.3.7 void DCM::DeviceControl::RemoveSNMPTrapDest (in string *IPAddress*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Remove the specified SNMP trap destination.

Exceptions

<i>TimeOut</i>	A timeout occurred during IIOP processing.
<i>OpNotSucceeded</i>	There was no trap destination for <i>IPAddress</i> configured.
<i>OpNotAllowed</i>	Not logged on.
<i>OpNotSupported</i>	Thrown if this call is not supported in the running software version.

8.3.3.8 void DCM::DeviceControl::SetSNMP_MystroTrapsEnabled (in boolean *bEnabled*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)

Enable/Disable sending of Mistro MIB traps (addservice etc)

Exceptions

<i>TimeOut</i>	A timeout occurred during IIOP processing.
<i>OpNotSucceeded</i>	Never thrown.
<i>OpNotAllowed</i>	Not logged on.
<i>OpNotSupported</i>	Thrown if this call is not supported in the running software version.
<i>OutOfRange</i>	Never thrown.

8.4 General board configuration calls

Board functionality - used to retrieve Board information.

Classes

- struct `DCM::DeviceControl::VersionParts`
Version number information.
- struct `DCM::DeviceControl::VersionInfo`
Version info.
- struct `DCM::DeviceControl::BoardIdentification`
Information data as returned by `GetSystemId()`.
- struct `DCM::DeviceControl::UniqueDeviceId_t`

Typedefs

- typedef sequence< VersionInfo > `DCM::DeviceControl::VersionInfoList`
A sequence of `VersionInfo`.
- typedef sequence< BoardIdentification > `DCM::DeviceControl::BoardIdentificationList`
- typedef sequence< UniqueDeviceId_t > `DCM::DeviceControl::UniqueDeviceIdList_t`
A sequence of `UniqueDeviceIdList` entries.

Enumerations

- enum `DCM::DeviceControl::PresenceStatus` { `DCM::DeviceControl::NotPresent`, `DCM::DeviceControl::Present`, `DCM::DeviceControl::Present_Not_Initialized`, `DCM::DeviceControl::Present_Error` }
Possible values `IsBoardPresent()` can return.
- enum `DCM::DeviceControl::eRebootType` { `DCM::DeviceControl::WarmReboot`, `DCM::DeviceControl::ColdReboot`, `DCM::DeviceControl::CleanReboot` }
Possible options to Reboot the DCM.

Functions

- BoardIdentification `DCM::DeviceControl::GetSystemId ()` raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get the system version information.
- void `DCM::DeviceControl::SetSystemName` (in string Name) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Set the system unit name.
- long `DCM::DeviceControl::GetNbrOfSlots ()` raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get the number of boards that a device can have, including mainboard.
- PresenceStatus `DCM::DeviceControl::IsBoardPresent` (in long SlotNbr) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Measure the presence of a board on a particular board location the SlotNbr ranges from 1 to NbrOfSlots.
- BoardIdentification `DCM::DeviceControl::GetBoardId` (in long SlotNbr) raises (Timeout, OutOfRange, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get the boardtype information This call returns input, output, processor, etc.

- BoardIdentificationList [DCM::DeviceControl::GetBoardIdExt](#) (in long SlotNbr) raises (TimeOut, OutOfRange, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get the extended boardtype information This call returns a list of BoardIdentifications: input, output, processor, etc.
- void [DCM::DeviceControl::GetUniqueDeviceId](#) (in unsigned short BoardNr, out UniqueDeviceIdList_t UniqueDeviceIdList) raises (TimeOut, OutOfRange, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get the unique device identity information This call returns information which can be shown on the GUI.
- void [DCM::DeviceControl::SetUserName](#) (in long SlotNbr, in string UserName) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Set the user-defined name of a board.
- void [DCM::DeviceControl::RebootDCM](#) (in IPS_Ref_t RefPhys, in eRebootType RebootType) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Reboot the [DCM](#) or a board Single board reboots are only supported for active IP Adapter Video cards.

8.4.1 Detailed Description

Board functionality - used to retrieve Board information.

8.4.2 Typedef Documentation

8.4.2.1 typedef sequence<BoardIdentification> DCM::DeviceControl::BoardIdentificationList

Definition at line 1291 of file DCM.idl.

8.4.2.2 typedef sequence<UniqueDeviceId_t> DCM::DeviceControl::UniqueDeviceIdList_t

A sequence of UniqueDeviceIdList entries.

Definition at line 1300 of file DCM.idl.

8.4.2.3 typedef sequence<VersionInfo> DCM::DeviceControl::VersionInfoList

A sequence off [VersionInfo](#).

Definition at line 1278 of file DCM.idl.

8.4.3 Enumeration Type Documentation

8.4.3.1 enum DCM::DeviceControl::eRebootType

Possible options to Reboot the DCM.

Enumerator:

WarmReboot All settings remain intact.

ColdReboot All settings cleared except IP address and licenses.

CleanReboot All settings cleared included Ip address and licenses.

Definition at line 1437 of file DCM.idl.

8.4.3.2 enum DCM::DeviceControl::PresenceStatus

Possible values [IsBoardPresent\(\)](#) can return.

Enumerator:

NotPresent

Present

Present_Not_Initialized

Present_Error

Definition at line 1252 of file DCM.idl.

8.4.4 Function Documentation

8.4.4.1 BoardIdentification DCM::DeviceControl::GetBoardId (in long *SlotNbr*) raises (TimeOut, OutOfRange, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the boardtype information This call returns input, output, processor, etc.

in [BoardIdentification](#) format.

Parameters

in	<i>SlotNbr</i>	[1..(Number of available slots returned by GetNbrOfSlots)]
----	----------------	--

Returns

Requested board information

Exceptions

<i>OpNotSucceeded</i>	in case of internal error
<i>OutOfRange</i>	in case an invalid <i>SlotNbr</i> is used:

Note

The *SlotNbr* differs from the *BoardNbr* used in the other DCM IDL calls

- *SlotNbr* is a long => Compatibility reasons with ROSA/Copernicus
- *SlotNbr* = DCM *BoardNbr* + 1
- *SlotNumber* = 1 = DCM main board
- *SlotNumber* = 2 = DCM board 1
- *SlotNumber* = 3 = DCM board 2
- ...

8.4.4.2 BoardIdentificationList DCM::DeviceControl::GetBoardIdExt (in long *SlotNbr*) raises (TimeOut, OutOfRange, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the extended boardtype information This call returns a list of BoardIdentifications: input, output, processor, etc.

in [BoardIdentification](#) format.

Main board: returns a [BoardIdentification](#) for the mainboard only. IO boards: returns a list of Board-Identifications for the IO-board and the present Boards on the IO-board:

- ASI: IO and (no) Transrater BoardIdentification.
- GBE: IO and (no) Transrater and (no) FEC-board BoardIdentification.

Parameters

in	<i>SlotNbr</i>	[1..(Number of available slots returned by GetNbrOfSlots)]
----	----------------	--

Returns

list of Requested board information

Exceptions

<i>OpNotSucceeded</i>	in case of internal error
<i>OutOfRange</i>	in case an invalid SlotNbr is used:

Note

The SlotNbr differs from the BoardNbr used in the other DCM IDL calls

- SlotNbr is a long => Compatibility reasons with ROSA/Copernicus
- SlotNbr = DCM BoardNbr + 1
- SlotNumber = 1 = DCM main board
- SlotNumber = 2 = DCM board 1
- SlotNumber = 3 = DCM board 2
- ...

8.4.4.3 long DCM::DeviceControl::GetNbrOfSlots () raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the number of boards that a device can have, including mainboard.

The number of boards returned can be different for other types of chassis.

Returns

The Nbr of boards including mainboard (boards can currently be present or not).

Exceptions

<i>OpNotSucceeded</i>	in case of internal error
-----------------------	---------------------------

8.4.4.4 BoardIdentification DCM::DeviceControl::GetSystemId () raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the system version information.

Returns

The system identification in [BoardIdentification](#) format.

Exceptions

<i>OpNotSucceeded</i>	in case of internal error
-----------------------	---------------------------

8.4.4.5 void DCM::DeviceControl::GetUniqueDeviceId (in unsigned short BoardNr, out UniqueDeviceIdList_t UniqueDeviceIdList) raises (TimeOut, OutOfRange, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the unique device identity information This call returns information which can be shown on the GUI.

Parameters

in	<i>BoardNr</i>	The Board from which to retrieve information
out	<i>UniqueDevice-IdList</i>	Requested board information

Returns

Requested board information

Exceptions

<i>OpNotSucceeded</i>	in case of internal error
<i>OutOfRange</i>	in case an invalid BoardNumber is used:

8.4.4.6 PresenceStatus DCM::DeviceControl::IsBoardPresent (in long SlotNbr) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Measure the presence of a board on a particular board location the SlotNbr ranges from 1 to NbrOfSlots.

Parameters

in	<i>SlotNbr</i>	[1..(Number of available slots returned by GetNbrOfSlots + 1)]
----	----------------	--

Returns

A [PresenceStatus](#) indicating whether the specified board is present or not.

Exceptions

<i>OpNotSucceeded</i>	in case an invalid SlotNbr is used:
-----------------------	-------------------------------------

Note

The SlotNbr differs from the BoardNbr used in the other DCM IDL calls

- SlotNbr is a long => Compatibility reasons with ROSA/Copernicus
- SlotNbr = DCM BoardNbr + 1
- SlotNumber = 1 = DCM main board
- SlotNumber = 2 = DCM board 1
- SlotNumber = 3 = DCM board 2
- ...
- SlotNumber = GetNbrOfSlots+1 = virtual board, returns the system information

8.4.4.7 void DCM::DeviceControl::RebootDCM (in IPS_Ref_t *RefPhys*, in eRebootType *RebootType*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Reboot the **DCM** or a board Single board reboots are only supported for active IP Adapter Video cards.

In case an IP Adapter card is cold rebooted, only the card's settings will be removed. Mainboard's and other card's settings are preserved.

Parameters

in	<i>RefPhys</i>	The Slot (and Port) to apply the call on. The Port is ignored. Specify 0 or 0xFFFF as board number to reboot the whole chassis. Slotnumbers 1-n will reboot the board in the selected slot.
in	<i>RebootType</i>	contains warm or cold indication meaning a preserve or cleanup settings

Exceptions

<i>OpNotSucceeded</i>	in case an invalid board number was used or the target board is not an active IP Adapter Video board. A card being hotswapped out is considered inactive.
-----------------------	---

8.4.4.8 void DCM::DeviceControl::SetSystemName (in string *Name*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the system unit name.

Parameters

in	<i>Name</i>	Specifies the used defined system name, string should be maximum 40 chars
----	-------------	---

Exceptions

<i>OpNotSucceeded</i>	in case of internal error
-----------------------	---------------------------

8.4.4.9 void DCM::DeviceControl::SetUserName (in long *SlotNbr*, in string *UserName*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the user-defined name of a board.

Parameters

in	<i>SlotNbr</i>	[1..(Number of available slots returned by GetNbrOfSlots + 1)]
in	<i>UserName</i>	new user name value, string should be maximum 40 chars

Exceptions

<i>OpNotSucceeded</i>	in case an invalid SlotNbr is used:
-----------------------	-------------------------------------

Note

The SlotNbr differs from the BoardNbr used in the other DCM IDL calls

- SlotNbr is a long => Compatibility reasons with ROSA/Copernicus
- SlotNbr = DCM BoardNbr + 1
- SlotNumber = 1 = DCM main board
- SlotNumber = 2 = DCM board 1
- SlotNumber = 3 = DCM board 2
- ...
- SlotNumber = GetNbrOfSlots+1 = virtual board, returns the system information

8.5 Logging facilities on the DCM

Classes

- struct [DCM::DeviceControl::ModuleExceptionTrace_t](#)
Structure to get or set Debug Trace Level information.

Typedefs

- typedef sequence < [ModuleExceptionTrace_t](#) > [DCM::DeviceControl::ModuleExceptionTraceList_t](#)

Enumerations

- enum [DCM::DeviceControl::eTraceLevel](#) { [DCM::DeviceControl::eDebugAll](#), [DCM::DeviceControl::eDebugMinor](#), [DCM::DeviceControl::eDebugMajor](#), [DCM::DeviceControl::eDebugNone](#) }
Indicates how much debugging information is generated for enabled modules A specific Tracelevel includes all levels above.

Functions

- void [DCM::DeviceControl::LOG_SetLTM](#) (in [IPS_Ref_t](#) RefPhys, in unsigned long level, in unsigned long type, in unsigned long mid) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Deprecated.
- void [DCM::DeviceControl::GetModuleTraceLevel](#) (in unsigned short BoardNumber, out [eTraceLevel](#) TraceLevel, out [ModuleExceptionTraceList_t](#) ModuleExceptionTraceList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get the current Trace level and the list of Module names and Modules Id's.
- void [DCM::DeviceControl::SetModuleTraceLevel](#) (in unsigned short BoardNumber, in [eTraceLevel](#) TraceLevel, in [ModuleExceptionTraceList_t](#) ModuleExceptionTraceList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Set the current Trace level and enable/disable a list of modules.
- void [DCM::DeviceControl::IDL_Trace](#) (in unsigned short BoardNumber, in string LogTraces) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Log a string in the trace of a specific board.

8.5.1 Typedef Documentation

8.5.1.1 typedef sequence<[ModuleExceptionTrace_t](#)> [DCM::DeviceControl::ModuleExceptionTraceList_t](#)

Definition at line 1495 of file DCM.idl.

8.5.2 Enumeration Type Documentation

8.5.2.1 enum [DCM::DeviceControl::eTraceLevel](#)

Indicates how much debugging information is generated for enabled modules A specific Tracelevel includes all levels above.

Enumerator:

eDebugAll
eDebugMinor
eDebugMajor
eDebugNone

Definition at line 1479 of file DCM.idl.

8.5.3 Function Documentation

8.5.3.1 void DCM::DeviceControl::GetModuleTraceLevel (in unsigned short *BoardNumber*, out eTraceLevel *TraceLevel*, out ModuleExceptionTraceList_t *ModuleExceptionTraceList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the current Trace level and the list of Module names and Modules Id's.

Parameters

in	<i>BoardNumber</i>	The Board from which to retrieve information
out	<i>TraceLevel</i>	The current tracelevel on the board
out	<i>Module-Exception-TraceList</i>	

8.5.3.2 void DCM::DeviceControl::IDL_Trace (in unsigned short *BoardNumber*, in string *LogTraces*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Log a string in the trace of a specific board.

Parameters

in	<i>BoardNumber</i>	The Board for which a trace message is sent.
in	<i>LogTraces</i>	The string to log into the trace file of the BoardNumber.

Exceptions

<i>OpNotSucceeded</i>	In case of Unexisting board.
-----------------------	--

8.5.3.3 void DCM::DeviceControl::LOG_SetLTM (in IPS_Ref_t *RefPhys*, in unsigned long *level*, in unsigned long *type*, in unsigned long *mid*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Deprecated.

Set level, type and module ID for logging.

Parameters

in	<i>RefPhys</i>	The Slot (and Port) to apply the call on.
in	<i>level</i>	Contains a bitmask with a combination of modeLogSvrty

in	<i>type</i>	Contains a bitmask with a combination of modeLogType
in	<i>mid</i>	Contains a bitmask to enable/disable logging for individual modules

8.5.3.4 void DCM::DeviceControl::SetModuleTraceLevel (in unsigned short *BoardNumber*, in eTraceLevel *TraceLevel*, in ModuleExceptionTraceList_t *ModuleExceptionTraceList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the current Trace level and enable/disable a list of modules.

Parameters

in	<i>BoardNumber</i>	The Board from which to retrieve information
in	<i>TraceLevel</i>	The desired tracelevel on the board
in	<i>Module-Exception-TraceList</i>	A list indicating the Modules to enable/disable

Exceptions

<i>OpNotSucceeded</i>	In case of • setting an invalid TraceLevel • an invalid ModuleId is sent
-----------------------	---

8.6 Application Specific Configuration management

This groups enums, types and methods to control and display what's actually inside the box.

Classes

- struct `DCM::DeviceControl::BoardInfo_t`
Structure to return board configuration.
- struct `DCM::DeviceControl::BoardInfo_V2_t`
Structure to return board configuration.
- struct `DCM::DeviceControl::BoardCfg_t`
Structure to get or set port information.
- struct `DCM::DeviceControl::BoardCfg_V2_t`
Structure to get or set port information.
- struct `DCM::DeviceControl::ComponentTemperature_t`
- struct `DCM::DeviceControl::BoardTemperature_t`
- struct `DCM::DeviceControl::IP_Subnet_t`
- struct `DCM::DeviceControl::NicTeam_Settings`
Structure to get or set NIC team configuration.
- struct `DCM::DeviceControl::NicTeam_MemberStatus_t`
Structure describing the status of a NIC team member.
- struct `DCM::DeviceControl::NicTeamStatus`
Structure to get NIC team status.

Typedefs

- typedef sequence< BoardInfo_t > `DCM::DeviceControl::BoardInfo_List_t`
A sequence of [BoardInfo_t](#) entries.
- typedef sequence< BoardInfo_V2_t > `DCM::DeviceControl::BoardInfo_List_V2_t`
A sequence of [BoardInfo_V2_t](#) entries.
- typedef sequence< BoardCfg_t > `DCM::DeviceControl::BoardCfg_List_t`
A sequence of [BoardCfg_t](#) entries.
- typedef sequence< BoardCfg_V2_t > `DCM::DeviceControl::BoardCfg_V2_List_t`
A sequence of [BoardCfg_V2_t](#) entries.
- typedef sequence< unsigned short > `DCM::DeviceControl::PortList_t`
A sequence of shorts used to filter ports.
- typedef sequence< unsigned short > `DCM::DeviceControl::BoardList_t`
A sequence of shorts used to filter boards.
- typedef sequence < ComponentTemperature_t > `DCM::DeviceControl::ComponentTemperature_List_t`
- typedef sequence < BoardTemperature_t > `DCM::DeviceControl::BoardTemperature_List_t`
- typedef sequence< IP_Subnet_t > `DCM::DeviceControl::IP_SubnetList_t`
A sequence of [IP_Subnet_t](#).
- typedef sequence< IPS_Ref_t > `DCM::DeviceControl::NicTeam_MemberList_t`
- typedef sequence < NicTeam_MemberStatus_t > `DCM::DeviceControl::NicTeam_MemberStatus_List_t`

Enumerations

- enum `DCM::DeviceControl::eIOInterfaceType` { `DCM::DeviceControl::IOInterfaceType_IP`, `DCM::DeviceControl::IOInterfaceType_ASI`, `DCM::DeviceControl::IOInterfaceType_SDI` }

Types of ports or IO interfaces..

- enum `DCM::DeviceControl::eIOInterfaceType_V2` { `DCM::DeviceControl::IOInterfaceType_V2_IP`, `DCM::DeviceControl::IOInterfaceType_V2_ASI`, `DCM::DeviceControl::IOInterfaceType_V2_SDI`, `DCM::DeviceControl::IOInterfaceType_V2_8VSB`, `DCM::DeviceControl::IOInterfaceType_V2_DVBS2`, `DCM::DeviceControl::IOInterfaceType_V2_AES`, `DCM::DeviceControl::IOInterfaceType_V2_Reserved7`, `DCM::DeviceControl::IOInterfaceType_V2_Reserved8`, `DCM::DeviceControl::IOInterfaceType_V2_Reserved9`, `DCM::DeviceControl::IOInterfaceType_V2_Reserved10`, `DCM::DeviceControl::IOInterfaceType_V2_Reserved11`, `DCM::DeviceControl::IOInterfaceType_V2_Reserved12`, `DCM::DeviceControl::IOInterfaceType_V2_Reserved13`, `DCM::DeviceControl::IOInterfaceType_V2_Reserved14`, `DCM::DeviceControl::IOInterfaceType_V2_Reserved15` }

Types of ports or IO interfaces - Version 2.

- enum `DCM::DeviceControl::eIOType` { `DCM::DeviceControl::IOType_I0`, `DCM::DeviceControl::IOType_FixedIn`, `DCM::DeviceControl::IOType_FixedOut`, `DCM::DeviceControl::IOType_CfgIn`, `DCM::DeviceControl::IOType_CfgOut` }

Configuration types of a port.

- enum `DCM::DeviceControl::eIOType_V2` { `DCM::DeviceControl::IOType_V2_I0`, `DCM::DeviceControl::IOType_V2_FixedIn`, `DCM::DeviceControl::IOType_V2_FixedOut`, `DCM::DeviceControl::IOType_V2_CfgIn`, `DCM::DeviceControl::IOType_V2_CfgOut`, `DCM::DeviceControl::IOType_V2_Reserved6`, `DCM::DeviceControl::IOType_V2_Reserved7`, `DCM::DeviceControl::IOType_V2_Reserved8`, `DCM::DeviceControl::IOType_V2_Reserved9`, `DCM::DeviceControl::IOType_V2_Reserved10` }

Configuration types of a port.

- enum `DCM::DeviceControl::ePortEnabledMode` { `DCM::DeviceControl::ePortMode_Enabled`, `DCM::DeviceControl::ePortMode_Disabled`, `DCM::DeviceControl::ePortMode_AutoEnabled`, `DCM::DeviceControl::ePortMode_Reserved4`, `DCM::DeviceControl::ePortMode_Reserved5`, `DCM::DeviceControl::ePortMode_Reserved6`, `DCM::DeviceControl::ePortMode_Reserved7`, `DCM::DeviceControl::ePortMode_Reserved8`, `DCM::DeviceControl::ePortMode_Reserved9`, `DCM::DeviceControl::ePortMode_Reserved10` }

Enum to denote the port mode Note: Only ASI and Gbe ports can be set in AutoEnabled mode.

- enum `DCM::DeviceControl::ePortDisableMode` { `DCM::DeviceControl::ePortDisable_PortOnly`, `DCM::DeviceControl::ePortDisable_FullLink` }
- enum `DCM::DeviceControl::eGbePortMode_t` { `DCM::DeviceControl::ePortPairMode`, `DCM::DeviceControl::eIndividualPortMode`, `DCM::DeviceControl::eGbePortModeReserved1`, `DCM::DeviceControl::eGbePortModeReserved2`, `DCM::DeviceControl::eGbePortModeReserved3`, `DCM::DeviceControl::eGbePortModeReserved4`, `DCM::DeviceControl::eGbePortModeReserved5` }

Configuration values for Gbe port mode.

- enum `DCM::DeviceControl::eNicTeamMode` { `DCM::DeviceControl::NicTeamMode_Revertive`, `DCM::DeviceControl::NicTeamMode_Floating`, `DCM::DeviceControl::NicTeamMode_Reserved3`, `DCM::DeviceControl::NicTeamMode_Reserved4`, `DCM::DeviceControl::NicTeamMode_Reserved5`, `DCM::DeviceControl::NicTeamMode_Reserved6`, `DCM::DeviceControl::NicTeamMode_Reserved7`, `DCM::DeviceControl::NicTeamMode_Reserved8`, `DCM::DeviceControl::NicTeamMode_Reserved9` }

NIC team configuration modes used in NicTeam_Settings.

- enum `DCM::DeviceControl::eLinkStatus` { `DCM::DeviceControl::LinkStatus_Down`, `DCM::DeviceControl::LinkStatus_Up`, `DCM::DeviceControl::LinkStatus_Reserved3`, `DCM::DeviceControl::LinkStatus_Reserved4`, `DCM::DeviceControl::LinkStatus_Reserved5`, `DCM::DeviceControl::LinkStatus_Reserved6`, `DCM::DeviceControl::LinkStatus_Reserved7`, `DCM::DeviceControl::LinkStatus_Reserved8`, `DCM::DeviceControl::LinkStatus_Reserved9` }

Management port link status, used in NicTeam_MemberStatus_t.

Functions

- BoardInfo_List_t [DCM::DeviceControl::BoardGetL](#) () raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Gets a list of present boards in the device and their board type.
- BoardInfo_List_V2_t [DCM::DeviceControl::BoardGetL_V2](#) () raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Gets a list of present boards in the device and their board type.
- BoardCfg_List_t [DCM::DeviceControl::BoardCfgGetL](#) (in unsigned short BoardNumber, in PortList_t PortList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
(Deprecated) Gets the configuration of a number of ports.
- void [DCM::DeviceControl::BoardCfgSet](#) (in BoardCfg_t BoardCfg) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
(Deprecated) Configure one port.
- BoardCfg_V2_List_t [DCM::DeviceControl::BoardCfg_V2_GetL](#) (in unsigned short BoardNumber, in PortList_t PortList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Gets the configuration of a number of ports - version 2.
- void [DCM::DeviceControl::BoardCfg_V2_Set](#) (in BoardCfg_V2_t BoardCfg) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange, LicenseError)
Configure one port - version 2.
- void [DCM::DeviceControl::PortDisableModeSet](#) (in IPS_Ref_t RefPhys, in ePortDisableMode PortDisableMode) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Configure the port disable mode for a GbE portset.
- void [DCM::DeviceControl::PortDisableModeGet](#) (in IPS_Ref_t RefPhys, out ePortDisableMode - PortDisableMode) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Request the port disable mode for a GbE portset.
- void [DCM::DeviceControl::BoardsConnected](#) (in unsigned short BoardNr, out BoardList_t BoardList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Gets a list of all boards (hw) connected to a specified BoardNr.
- void [DCM::DeviceControl::BoardGetTemperatures](#) (in unsigned short BoardNr, out BoardTemperature_List_t BoardTemperature_List) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Gets a list of all temperatures which can be measured.
- void [DCM::DeviceControl::IPS_IP_ParamsMbGet](#) (in IPS_Ref_t RefPhys, out string IPAddress, out string SubNetMask, out string DefaultGw, out string MacAddress) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Gets the IP address, network mask, default gateway and MAC address for a mainboard interface.
- void [DCM::DeviceControl::IPS_IP_ParamsMbSet](#) (in IPS_Ref_t RefPhys, in string IPAddress, in string SubNetMask, in string DefaultGw, in boolean Apply) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Sets the IP address, network mask and default gateway for a mainboard interface.
- void [DCM::DeviceControl::IPS_IPv6_ParamsMbGet](#) (in IPS_Ref_t RefPhys, out string IPAddress, out string SubNetMask, out string DefaultGw, out string MacAddress) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Gets the IP address, network mask, default gateway and MAC address for a mainboard interface.
- void [DCM::DeviceControl::IPS_IPv6_ParamsMbSet](#) (in IPS_Ref_t RefPhys, in string IPAddress, in string SubNetMask, in string DefaultGw) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Sets the IP address, network mask, default gateway and MAC address for a mainboard interface.

- void [DCM::DeviceControl::IPS_IP_ParamsMbGet_V2](#) (in [IPS_Ref_t](#) RefPhys, out [IP_SubnetList_t](#) IPConfig, out string MacAddress) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Gets all the IP addresses, prefix lengths, default gateways, aliases and MAC address for a mainboard interface.

- void [DCM::DeviceControl::IPS_IP_ParamsMbSet_V2](#) (in [IPS_Ref_t](#) RefPhys, in [IP_SubnetList_t](#) IPConfig, in boolean Apply) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Sets all the IP addresses, prefix lengths, default gateways and aliases for a mainboard interface.

- void [DCM::DeviceControl::SetGbePortMode](#) (in unsigned short BoardNr, in [eGbePortMode_t](#) Mode) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the given board in either individual port mode (2I2O) or port pairs mode.

- [eGbePortMode_t](#) [DCM::DeviceControl::GetGbePortMode](#) (in unsigned short BoardNr) raises (TimeOut, OpNotAllowed, OpNotSupported)

Returns the Gbe port mode of the given board.

- void [DCM::DeviceControl::GetNicTeamStatus](#) (out [NicTeamStatus](#) status) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Get the NIC team status.

- void [DCM::DeviceControl::GetNicTeamSettings](#) (out [NicTeam_Settings](#) settings) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Get the NIC team configuration.

- void [DCM::DeviceControl::SetNicTeamSettings](#) (in [NicTeam_Settings](#) settings) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Set the NIC team configuration.

Variables

- const unsigned short [DCM::DeviceControl::INVALID_BOARD](#) = 0xffff

Undefined board.

- const unsigned short [DCM::DeviceControl::MAINBOARD](#) = 0

- const unsigned short [DCM::DeviceControl::INVALID_PORT](#) = 0xffff

Undefined port.

- const unsigned short [DCM::DeviceControl::ANY_PORT](#) = 0xffff

Only for input parameters.

8.6.1 Detailed Description

This groups enums, types and methods to control and display what's actually inside the box.

8.6.2 Typedef Documentation

8.6.2.1 typedef sequence<[BoardCfg_t](#)> [DCM::DeviceControl::BoardCfg_List_t](#)

A sequence of [BoardCfg_t](#) entries.

Definition at line 1724 of file DCM.idl.

8.6.2.2 typedef sequence<BoardCfg_V2_t> DCM::DeviceControl::BoardCfg_V2_List_t

A sequence of [BoardCfg_V2_t](#) entries.

Definition at line 1729 of file DCM.idl.

8.6.2.3 typedef sequence<BoardInfo_t> DCM::DeviceControl::BoardInfo_List_t

A sequence of [BoardInfo_t](#) entries.

Definition at line 1584 of file DCM.idl.

8.6.2.4 typedef sequence<BoardInfo_V2_t> DCM::DeviceControl::BoardInfo_List_V2_t

A sequence of [BoardInfo_V2_t](#) entries.

Definition at line 1587 of file DCM.idl.

8.6.2.5 typedef sequence<unsigned short> DCM::DeviceControl::BoardList_t

A sequence of shorts used to filter boards.

Definition at line 1735 of file DCM.idl.

8.6.2.6 typedef sequence<BoardTemperature_t> DCM::DeviceControl::BoardTemperature_List_t

Definition at line 1958 of file DCM.idl.

8.6.2.7 typedef sequence<ComponentTemperature_t> DCM::DeviceControl::Component-Temperature_List_t

Definition at line 1946 of file DCM.idl.

8.6.2.8 typedef sequence<IP_Subnet_t> DCM::DeviceControl::IP_SubnetList_t

A sequence of [IP_Subnet_t](#).

Definition at line 2070 of file DCM.idl.

8.6.2.9 typedef sequence<IPS_Ref_t> DCM::DeviceControl::NicTeam_MemberList_t

Definition at line 2181 of file DCM.idl.

8.6.2.10 typedef sequence<NicTeam_MemberStatus_t> DCM::DeviceControl::NicTeam_Member-StatusList_t

Definition at line 2211 of file DCM.idl.

8.6.2.11 typedef sequence<unsigned short> DCM::DeviceControl::PortList_t

A sequence of shorts used to filter ports.

Definition at line 1732 of file DCM.idl.

8.6.3 Enumeration Type Documentation**8.6.3.1 enum DCM::DeviceControl::eGbePortMode_t**

Configuration values for Gbe port mode.

Version

Release 8.0

Enumerator:

ePortPairMode ports are configured in bidirectional port pairs.
eIndividualPortMode ports are configured in 2 input ports (1 and 3) and 2 output ports (2 and 4).
eGbePortModeReserved1 reserved for future use
eGbePortModeReserved2 reserved for future use
eGbePortModeReserved3 reserved for future use
eGbePortModeReserved4 reserved for future use
eGbePortModeReserved5 reserved for future use

Definition at line 1740 of file DCM.idl.

8.6.3.2 enum DCM::DeviceControl::eIOInterfaceType

Types of ports or IO interfaces..

Enumerator:

IOInterfaceType_IP Gigabit Ethernet.
IOInterfaceType_ASI ASI.
IOInterfaceType_SDI SDI.

Definition at line 1590 of file DCM.idl.

8.6.3.3 enum DCM::DeviceControl::eIOInterfaceType_V2

Types of ports or IO interfaces - Version 2.

Version

Release 8.1

Enumerator:

IOInterfaceType_V2_IP Gigabit Ethernet.
IOInterfaceType_V2_ASI ASI.
IOInterfaceType_V2_SDI SDI.
IOInterfaceType_V2_8VSB 8VSB
IOInterfaceType_V2_DVBS2 DVBS2.
IOInterfaceType_V2_AES AES (AudioGW)
IOInterfaceType_V2_Reserved7 Reserved for future use.
IOInterfaceType_V2_Reserved8 Reserved for future use.
IOInterfaceType_V2_Reserved9 Reserved for future use.
IOInterfaceType_V2_Reserved10 Reserved for future use.
IOInterfaceType_V2_Reserved11 Reserved for future use.
IOInterfaceType_V2_Reserved12 Reserved for future use.
IOInterfaceType_V2_Reserved13 Reserved for future use.
IOInterfaceType_V2_Reserved14 Reserved for future use.
IOInterfaceType_V2_Reserved15 Reserved for future use.

Definition at line 1602 of file DCM.idl.

8.6.3.4 enum DCM::DeviceControl::eIOType

Configuration types of a port.

Enumerator:

IOType_I0 A GbE port always is input/output.

IOType_FixedIn GbE port configured as input only (e.g. first port of port-pair in 2I2O mode).

IOType_FixedOut GbE port configured as output only (e.g. second port of port-pair in 2I2O mode).

IOType_CfgIn An ASI port set for input.

IOType_CfgOut An ASI port set for output.

Definition at line 1623 of file DCM.idl.

8.6.3.5 enum DCM::DeviceControl::eIOType_V2

Configuration types of a port.

- version 2

Enumerator:

IOType_V2_I0 A port which is bidirectional (e.g. Gbe).

IOType_V2_FixedIn A port that is input only (e.g. first port of Gbe port-pair in 2I2O mode or 8VSB input port)

IOType_V2_FixedOut A port that is output only (e.g. second port of Gbe port-pair in 2I2O mode).

IOType_V2_CfgIn A port configured for input.

IOType_V2_CfgOut A port configured for output.

IOType_V2_Reserved6 Reserved for future use.

IOType_V2_Reserved7 Reserved for future use.

IOType_V2_Reserved8 Reserved for future use.

IOType_V2_Reserved9 Reserved for future use.

IOType_V2_Reserved10 Reserved for future use.

Definition at line 1635 of file DCM.idl.

8.6.3.6 enum DCM::DeviceControl::eLinkStatus

Management port link status, used in [NicTeam_MemberStatus_t](#).

Version

Release 11.10

Enumerator:

LinkStatus_Down

LinkStatus_Up

LinkStatus_Reserved3

LinkStatus_Reserved4

LinkStatus_Reserved5

LinkStatus_Reserved6

LinkStatus_Reserved7

LinkStatus_Reserved8

LinkStatus_Reserved9

Definition at line 2166 of file DCM.idl.

8.6.3.7 enum DCM::DeviceControl::eNicTeamMode

NIC team configuration modes used in [NicTeam_Settings](#).

Version

Release 11.10

Enumerator:

NicTeamMode_Revertive

NicTeamMode_Floating

NicTeamMode_Reserved3

NicTeamMode_Reserved4

NicTeamMode_Reserved5

NicTeamMode_Reserved6

NicTeamMode_Reserved7

NicTeamMode_Reserved8

NicTeamMode_Reserved9

Definition at line 2148 of file DCM.idl.

8.6.3.8 enum DCM::DeviceControl::ePortDisableMode

Enumerator:

ePortDisable_PortOnly If the port is disabled and the disable mode is set to port only, the link is enabled.

ePortDisable_FullLink If the port is disabled and the disable mode is set to full link, the link is disabled.

Definition at line 1717 of file DCM.idl.

8.6.3.9 enum DCM::DeviceControl::ePortEnabledMode

Enum to denote the port mode Note: Only ASI and Gbe ports can be set in AutoEnabled mode.

Enumerator:

ePortMode_Enabled Port is configured enabled.

ePortMode_Disabled Port is configured disabled.

ePortMode_AutoEnabled Port is configured auto enabled, will be enabled/disabled depending on whether the device is active or in backup.

ePortMode_Reserved4 Reserved for future use.
ePortMode_Reserved5 Reserved for future use.
ePortMode_Reserved6 Reserved for future use.
ePortMode_Reserved7 Reserved for future use.
ePortMode_Reserved8 Reserved for future use.
ePortMode_Reserved9 Reserved for future use.
ePortMode_Reserved10 Reserved for future use.

Definition at line 1676 of file DCM.idl.

8.6.4 Function Documentation

8.6.4.1 BoardCfg_V2_List_t DCM::DeviceControl::BoardCfg_V2_GetL (in unsigned short *BoardNumber*, in PortList_t *PortList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the configuration of a number of ports - version 2.

Parameters

in	<i>BoardNumber</i>	An unsigned short to indicate the slot.
in	<i>PortList</i>	A sequence of ports to get information about.

Returns

BoardCfg_V2_List_t A sequence of [BoardCfg_V2_t](#) entries.

Exceptions

<i>OpNotSupported</i>	When - BoardNumber = 0 = Main board. - The board is a IPGW board.
<i>OpNotSucceeded</i>	In case invalid references (BoardNumber, PortNbr) are used

Note

Send an empty PortList to get info of all ports on the specified board.

Version

Release 8.1

8.6.4.2 void DCM::DeviceControl::BoardCfg_V2_Set (in BoardCfg_V2_t *BoardCfg*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange, LicenseError)

Configure one port - version 2.

Parameters

in	<i>BoardCfg</i>	BoardCfg_V2_t structure holding the information to set.
----	-----------------	---

Exceptions

<i>OpNotSupported</i>	When - BoardNumber = 0 = Main board. - The board is a IPGW board.
<i>OpNotSucceeded</i>	In case of - Invalid references (BoardNumber, PortNumber,...). - Invalid enum values (IOType, IOInterfaceType). - changing the direction of an ASI port from IOType_CfgIn to IOType_CfgOut when input services are passed to an output or settings for input services are present - Port name too long (> 40 char). - When in port pair mode and the port reference is a backup port. - When you try to put a port of 8VSB, AudioGW, or VideoGW in AutoEnabled port mode.
<i>LicenseError</i>	When trying to enable a 8VSB port without a license available

Note

- Switching a port from output to input: the device does the switch including deleting all routing information.
- Switching a port from input to output: the device does the switch if no services are passed to an output, and no input service settings are present, otherwise an exception is generated.
- After switching the port from input -> output or vice versa, default settings will be applied.
- In port pair mode BoardCfg.PortEnabledMode applies to the port pair.
- In individual port mode (2I2O) mode each port can have a different value for BoardCfg.PortEnabledMode.

Version

Release 8.1

8.6.4.3 BoardCfg_List_t DCM::DeviceControl::BoardCfgGetL (in unsigned short *BoardNumber*, in PortList_t *PortList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

(Deprecated) Gets the configuration of a number of ports.

Parameters

in	<i>BoardNumber</i>	An unsigned short to indicate the slot.
in	<i>PortList</i>	A sequence of ports to get information about.

Returns

BoardCfg_List_t A sequence of [BoardCfg_t](#) entries.

Exceptions

<i>OpNotSupported</i>	When BoardNumber = 0 = Main board.
<i>OpNotSucceeded</i>	In case invalid references (BoardNumber, PortNbr) are used
<i>OpNotSucceeded</i>	when the port type is different from Asi, Gbe or SDI.

Note

Send an empty PortList to get info of all ports on the specified board.

Deprecated Use BoardCfg_V2_GetL instead.

8.6.4.4 void DCM::DeviceControl::BoardCfgSet (in BoardCfg_t *BoardCfg*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

(Deprecated) Configure one port.

Parameters

in	<i>BoardCfg</i>	BoardCfg_t structure holding the information to set.
----	-----------------	--

Exceptions

<i>OpNotSupported</i>	When BoardNumber = 0 = Main board.
<i>OpNotSucceeded</i>	In case of - Invalid references (BoardNumber, PortNumber,...). - Invalid enum values (IOType, IOInterfaceType). - changing the direction of an ASI port from IOType_CfgIn to IOType_CfgOut when input services are passed to an output or settings for input services are present - Port name too long (> 40 char).

Note

- Switching a port from output to input: the device does the switch including deleting all routing information.
- Switching a port from input to output: the device does the switch if no services are passed to an output, and no input service settings are present, otherwise an exception is generated.
- After switching the port from input -> output or vice versa, default settings will be applied.
- In port pair mode BoardCfg.enabled applies to the port pair (note that also reference of second port can be used, but the settings of the first port will be used, e.g. some of the settings provided in BoardCfg will be ignored).
- In individual port mode (2I2O) mode each port can have a different value for BoardCfg.enabled.
- When this call is performed the port will be forced to enabled or disabled mode and the auto-enabled port mode settings might be lost.

Deprecated Use BoardCfg_V2_Set instead.

8.6.4.5 BoardInfo_List.t DCM::DeviceControl::BoardGetL () raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets a list of present boards in the device and their board type.

This call will only return the board types used in eBoardType (ASI or GbE). If other types of boards are present in the device, these boards are not returned. For boards that are supported by [DCM](#) from release V6.9 onwards, the BoardGetL_V2 call should be used.

Returns

BoardInfo_List_t A list of [BoardInfo_t](#).

Exceptions

<i>OpNotSucceeded</i>	in case of internal error
-----------------------	---------------------------

Note

To get the version info, the [GetBoardId](#) IDL should be used

Version

Release 1.0

8.6.4.6 BoardInfo_List_V2.t DCM::DeviceControl::BoardGetL_V2 () raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets a list of present boards in the device and their board type.

Returns

BoardInfo_List_V2_t A list of [BoardInfo_V2_t](#).

Exceptions

<i>OpNotSucceeded</i>	in case of internal error
-----------------------	---------------------------

Note

To get the version info, the [GetBoardId](#) IDL should be used

Version

Release 6.9

8.6.4.7 void DCM::DeviceControl::BoardGetTemperatures (in unsigned short *BoardNr*, out BoardTemperature_List_t *BoardTemperature_List*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets a list of all temperatures which can be measured.

Parameters

in	<i>BoardNr</i>	0 for main board or 1..n for I/O boards.
out	<i>BoardTemperature_List</i>	list of components with their measured temperature.

Exceptions

<i>OpNotSucceeded</i>	In case of invalid BoardNr
-----------------------	----------------------------

8.6.4.8 void DCM::DeviceControl::BoardsConnected (in unsigned short *BoardNr*, out BoardList_t *BoardList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets a list of all boards (hw) connected to a specified BoardNr.

Parameters

in	<i>BoardNr</i>	
out	<i>BoardList</i>	

Returns

BoardList contains SlotNbr of connected boards

- for MB (BoardNr = 0): 1 = IO board in slot 1 2 = IO board in slot 2 ...
- for IO (BoardNr > 0): 1 = transrater board 2 = FEC board
- for IP Adapter (> 0): 1 = JPEG2K board

Exceptions

<i>OpNotSucceeded</i>	In case of invalid BoardNr
-----------------------	----------------------------

8.6.4.9 eGbePortMode_t DCM::DeviceControl::GetGbePortMode (in unsigned short *BoardNr*) raises (TimeOut, OpNotAllowed, OpNotSupported)

Returns the Gbe port mode of the given board.

Parameters

in	<i>BoardNr</i>	contains board number.
----	----------------	------------------------

Returns

configured Gbe port mode.

Exceptions

<i>OpNotSupported</i>	: when board nbr does not match a Gbe IO board
-----------------------	--

Version

Supported since release 8.0

8.6.4.10 void DCM::DeviceControl::GetNicTeamSettings (out NicTeam_Settings *settings*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Get the NIC team configuration.

Parameters

out	<i>settings</i>	The NIC team configuration.
-----	-----------------	-----------------------------

Version

Release 11.10

8.6.4.11 void DCM::DeviceControl::GetNicTeamStatus (out NicTeamStatus *status*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Get the NIC team status.

Parameters

out	<i>status</i>	The NIC team status.
-----	---------------	----------------------

Exceptions

<i>OperationFailed</i>	When NIC teaming is disabled.
------------------------	-------------------------------

Version

Release 11.10

8.6.4.12 void DCM::DeviceControl::IPS_IP_ParamsMbGet (in IPS_Ref_t *RefPhys*, out string *IPAddress*, out string *SubNetMask*, out string *DefaultGw*, out string *MacAddress*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the IP address, network mask, default gateway and MAC address for a mainboard interface.

Parameters

in	<i>RefPhys</i>	Specifies BoardNr & PortNr to get the IP params from.
out	<i>IPAddress</i>	

out	<i>SubNetMask</i>	
out	<i>DefaultGw</i>	
out	<i>MacAddress</i>	

Returns

IPAddress Ip address of the interface
 SubNetMask SubNetMask of the interface
 DefaultGw Default gateway of the interface
 MacAddress MAC address of the interface

Exceptions

<i>OpNotSupported</i>	When called for other boards than the mainboard
<i>OpNotSucceeded</i>	In case invalid references are used (RefPhys).

Version

Supported since release 5.1

8.6.4.13 void DCM::DeviceControl::IPS_IP_ParamsMbGet_V2 (in IPS_Ref_t *RefPhys*, out IP_SubnetList_t *IPConfig*, out string *MacAddress*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Gets all the IP addresses, prefix lengths, default gateways, aliases and MAC address for a mainboard interface.

Parameters

in	<i>RefPhys</i>	Specifies BoardNr & PortNr to get the IP params from.
out	<i>IPConfig</i>	
out	<i>MacAddress</i>	

Returns

IPConfig IP configuration of the interface
 MacAddress MAC address of the interface

Exceptions

<i>OpNotSupported</i>	When called for other boards than the mainboard
<i>OpNotSucceeded</i>	In case invalid references are used (RefPhys).
<i>OperationFailed</i>	

Version

Supported since release 10.10

8.6.4.14 void DCM::DeviceControl::IPS_IP_ParamsMbSet (in IPS_Ref_t *RefPhys*, in string *IPaddress*, in string *SubNetMask*, in string *DefaultGw*, in boolean *Apply*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Sets the IP address, network mask and default gateway for a mainboard interface.

When a valid gateway is specified, it replaces the currently existing default gateway. To specify no gateway, use 0.0.0.0

Parameters

in	<i>RefPhys</i>	Specifies BoardNr & PortNr to set the IP params.
in	<i>IPaddress</i>	The new IP address
in	<i>SubNetMask</i>	The new netmask
in	<i>DefaultGw</i>	The default gateway or 0.0.0.0
in	<i>Apply</i>	Indicates if you only want to verify the setting or apply it as well

Exceptions

<i>OpNotSupported</i>	When called for other boards than the mainboard
<i>OpNotSucceeded</i>	In case invalid references are used (RefPhys).
<i>OpNotSucceeded</i>	In case an invalid IP address is given.
<i>OpNotSucceeded</i>	In case an invalid SubNetMask address is given.
<i>OpNotSucceeded</i>	In case an invalid Default gateway is given.

Version

Supported since release 8.5

8.6.4.15 void DCM::DeviceControl::IPS_IP_ParamsMbSet_V2 (in IPS_Ref_t *RefPhys*, in IP_SubnetList_t *IPConfig*, in boolean *Apply*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Sets all the IP addresses, prefix lengths, default gateways and aliases for a mainboard interface.

When a valid gateway is specified, it replaces the currently existing default gateway. To specify no gateway, use "0.0.0.0" or "::-"

Parameters

in	<i>RefPhys</i>	Specifies BoardNr & PortNr to set the IP params.
in	<i>IPConfig</i>	The new IP configuration
in	<i>Apply</i>	Indicates if you only want to verify the setting or apply it as well

Exceptions

<i>OpNotSupported</i>	When called for other boards than the mainboard
<i>OpNotSucceeded</i>	In case invalid references are used (RefPhys).
<i>OpNotSucceeded</i>	In case an invalid IP configuration is given.
<i>OperationFailed</i>	

Note

Per protocol (IPv4 or IPv6) only one subnet may have a default gateway entered. The default gateway for IPv4 doesn't need to be on the same interface as for IPv6.

Version

Supported since release 10.10

8.6.4.16 void DCM::DeviceControl::IPS_IPv6_ParamsMbGet (in IPS_Ref_t *RefPhys*, out string *IPAddress*, out string *SubNetMask*, out string *DefaultGw*, out string *MacAddress*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the IP address, network mask, default gateway and MAC address for a mainboard interface.

Parameters

in	<i>RefPhys</i>	Specifies BoardNr & PortNr to get the IP params from.
out	<i>IPAddress</i>	
out	<i>SubNetMask</i>	
out	<i>DefaultGw</i>	
out	<i>MacAddress</i>	

Returns

IPAddress Ip address of the interface
 SubNetMask SubNetMask of the interface
 DefaultGw Default gateway of the interface
 MacAddress MAC address of the interface

Exceptions

<i>OpNotSupported</i>	When called for other boards than the mainboard
<i>OpNotSupported</i>	When called on DCM without IPv6 kernel stack
<i>OpNotSucceeded</i>	In case invalid references are used (RefPhys).

Version

Supported since release 8.2

Note

!!!! EXPERIMENTAL - DO NOT USE !!!!

8.6.4.17 void DCM::DeviceControl::IPS_IPv6_ParamsMbSet (in IPS_Ref_t *RefPhys*, in string *IPAddress*, in string *SubNetMask*, in string *DefaultGw*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Sets the IP address, network mask, default gateway and MAC address for a mainboard interface.

Parameters

in	<i>RefPhys</i>	Specifies BoardNr & PortNr to set the IP params from.
in	<i>IPAddress</i>	
in	<i>SubNetMask</i>	
in	<i>DefaultGw</i>	

Returns

IPAddress Ip address of the interface
 SubNetMask SubNetMask of the interface
 DefaultGw Default gateway of the interface

Exceptions

<i>OpNotSupported</i>	When called for other boards than the mainboard
<i>OpNotSupported</i>	When called on DCM without IPv6 kernel stack
<i>OpNotSucceeded</i>	In case invalid references are used (RefPhys).

Version

Supported since release 8.2

Note

!!!! EXPERIMENTAL - DO NOT USE !!!!

8.6.4.18 void DCM::DeviceControl::PortDisableModeGet (in IPS_Ref_t *RefPhys*, out ePortDisableMode *PortDisableMode*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Request the port disable mode for a GbE portset.

Parameters

in	<i>RefPhys</i>	The BoardNr and PortNr on which the mode is requested, only for GbE boards
out	<i>PortDisable-Mode</i>	The requested port disable mode.

Returns

PortDisableMode

Exceptions

<i>OpNotSupported</i>	When the board is not a GbE board, IP Video Adapter board or IP Audio Gateway board.
<i>OpNotSucceeded</i>	In case of Invalid references (BoardNumber, PortNumber,...), only valid on GbE board.

Note

- In port pair mode only RefPhys of first port in port pair can be given (otherwise OpNotSucceeded is returned).
- In 2I2O mode the physref of each port in the port pair can be provided.

8.6.4.19 void DCM::DeviceControl::PortDisableModeSet (in IPS_Ref_t *RefPhys*, in ePortDisableMode *PortDisableMode*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Configure the port disable mode for a GbE portset.

Parameters

in	<i>RefPhys</i>	The BoardNr and PortNr on which the mode must be set, only for GbE boards
in	<i>PortDisableMode</i>	The parameter of the port disable mode.

Exceptions

<i>OpNotSupported</i>	When the board is not a GbE board, IP Video Adapter board or IP Audio Gateway board.
<i>OpNotSucceeded</i>	In case of • Invalid references (BoardNumber, PortNumber,...), only valid on GbE board. • Invalid enum values (PortDisableMode).

Note

- In port pair mode, port disable mode is set for both ports of the port pair when reference of first port is given. An OpNotSucceeded exception is returned if a reference of the second port in the port pair is provided.
- In individual port mode (2I2O) mode it is possible to set the port disable mode for each individual port, hence no exception is generated if the second port is given as port reference.

8.6.4.20 void DCM::DeviceControl::SetGbePortMode (in unsigned short *BoardNr*, in eGbePortMode_t *Mode*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the given board in either individual port mode (2I2O) or port pairs mode.

Parameters

in	<i>BoardNr</i>	contains board number
in	<i>Mode</i>	specifies the board mode to be set

Exceptions

<i>OpNotSupported</i>	when board nbr does not match a Gbe IO board
<i>OpNotSucceed</i>	when port mirroring or backup is active

Version

Supported since release 8.0

8.6.4.21 `void DCM::DeviceControl::SetNicTeamSettings ( in NicTeam_Settings settings ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)`

Set the NIC team configuration.

Parameters

<code>in</code>	<code><i>settings</i></code>	The NIC team configuration to set.
-----------------	------------------------------	------------------------------------

Exceptions

<code><i>OperationFailed</i></code>	in case the configuration is invalid.
-------------------------------------	---------------------------------------

Note

This operation will cause the [DCM](#) to reboot if it enables or disables NIC teaming or changes parameters while NIC teaming is enabled.

Version

Release 11.10

8.6.5 Variable Documentation

8.6.5.1 `const unsigned short DCM::DeviceControl::ANY_PORT = 0xffff`

Only for input parameters.

If you want all ports on a board.

Definition at line 1555 of file DCM.idl.

8.6.5.2 `const unsigned short DCM::DeviceControl::INVALID_BOARD = 0xffff`

Undefined board.

Definition at line 1548 of file DCM.idl.

8.6.5.3 `const unsigned short DCM::DeviceControl::INVALID_PORT = 0xffff`

Undefined port.

Definition at line 1551 of file DCM.idl.

8.6.5.4 `const unsigned short DCM::DeviceControl::MAINBOARD = 0`

Definition at line 1549 of file DCM.idl.

8.7 Multiplexing

This contains types, enums and methods to configure the multiplexer part of the device.

Collaboration diagram for Multiplexing:

Modules

- [TS](#)
This contains types, enums and methods to configure the TSs of the multiplexer part in the device.
- [Service](#)
This contains types, enums and methods to configure the TS Services of the multiplexer part in the device.
- [Pid](#)
This contains types, enums and methods to configure the pid settings of the multiplexer part in the device.
- [PortConfig](#)

This contains types, enums and methods to configure the ports of the multiplexer part in the device.

- [8-VSB](#)

This contains types, enums and methods to configure 8VSB ports.

- [DVB-S2](#)

This contains types, enums and methods to configure DVB-S2 ports.

- [Descriptors](#)

This contains types, enums and methods to configure descriptors settings of the multiplexer part in the device.

- [Others](#)

This contains types, enums and methods to configure other settings of the multiplexer part in the device.

- [PSIP](#)

This module contains types, enums and methods related to ATSC PSIP (Program and System Information Protocol)

8.7.1 Detailed Description

This contains types, enums and methods to configure the multiplexer part of the device.

8.8 TS

This contains types, enums and methods to configure the TSs of the multiplexer part in the device.

Collaboration diagram for TS:

Classes

- struct `DCM::DeviceControl::IPS_UDP_Socket_t`
The socket describes the IP address & UDP port on which a TS is played out.
- struct `DCM::DeviceControl::IPS_InputTS_t`
Information of an incoming TS.
- struct `DCM::DeviceControl::IPS_Gbe_InputTS_t`
Gbe information of an incoming TS.
- struct `DCM::DeviceControl::Debug_Gbe_InputTS_t`
- struct `DCM::DeviceControl::IPS_ChangeInputTS_t`
Information to change an incoming TS.
- struct `DCM::DeviceControl::Debug_Gbe_OutputTS_t`
Information-Settings of an outgoing TS.
- struct `DCM::DeviceControl::IPS_OutputTS_t`
- struct `DCM::DeviceControl::IPS_OutputTS_V2_t`
Information-Settings of an outgoing TS.
- struct `DCM::DeviceControl::IPS_LookupTS_t`
Structure to find a specific TS by IP-address and UDP port.
- struct `DCM::DeviceControl::IPS_ReferenceTS_t`
Structure to find a specific TS by IP-address and UDP port.
- struct `DCM::DeviceControl::IPS_OutPID_Data_t`
Used for PID passing by `IPS_OutPID_AddL()`, `IPS_OutPID_GetL()` and `IPS_OutPID_DeleteL()`
- struct `DCM::DeviceControl::IPS_OutPID_Data2_t`
- struct `DCM::DeviceControl::IPS_InPID_Data_t`
- struct `DCM::DeviceControl::IPS_InPID_Data_V2_t`
- struct `DCM::DeviceControl::InEMM_Ref_t`
Identification of which PID to be created/deleted. Note this is duplicated by `RefPid_t` but must remain for backwards compatability.
- struct `DCM::DeviceControl::EMM_Data_t`
Identification of EMMG EMMs.
- struct `DCM::DeviceControl::Ref_SI_table_ext_t`
- struct `DCM::DeviceControl::SI_Table_Period_t`
- struct `DCM::DeviceControl::SI_Table_GenerationMode_t`

Generation mode for SI tables.

- struct `DCM::DeviceControl::TS_SI_Table_Periods_t`
- struct `DCM::DeviceControl::TableKeys_t`
- struct `DCM::DeviceControl::TOT_Timezone_t`

Structure that represents required data to construct TOT descriptor.

- struct `DCM::DeviceControl::TS_TOT_Timezone_t`

Structure that represents required data to construct all TOT descriptors on a specific TS.

- struct `DCM::DeviceControl::RoutingStatusRecord_t`

Structure that contains information about one error that occurred during routing file upload (pre-config - IPS_ProcessRoutingFile)

- struct `DCM::DeviceControl::IPS_RefPid_t`

Note RefPid_t is effectively a copy of InEMM_Ref_t but that must remain for compatability.

- struct `DCM::DeviceControl::CompPidES_t`

Identification of muxed pids.

- struct `DCM::DeviceControl::CompPidES_V2_t`
- struct `DCM::DeviceControl::TS_AutoPassRules`

MPTS pass through settings.

- struct `DCM::DeviceControl::TS_AutoPassRulesDisableFlags`

MPTS Passthrough disable flags.

- struct `DCM::DeviceControl::DefaultAutoPassRules`

Default Service component behaviour.

- struct `DCM::DeviceControl::Service_AutoPassRules`

Service component behaviour.

- struct `DCM::DeviceControl::SI_AutoPassRules_t`
- struct `DCM::DeviceControl::OutTS_InsertCATDescriptors_t`
- struct `DCM::DeviceControl::TimeBaseSelectionMode_t`
- struct `DCM::DeviceControl::InTS_TimeBaseSelectionMode_t`
- struct `DCM::DeviceControl::BoardDejitterCfg_t`
- struct `DCM::DeviceControl::TimeBaseSelectionMode_V2_t`
- struct `DCM::DeviceControl::InTS_TimeBaseSelectionMode_V2_t`
- struct `DCM::DeviceControl::InTsExistenceReasons_t`

Input Transport stream reason for existence bitmap.

- struct `DCM::DeviceControl::GbeIO_IP_Settings_t`
- struct `DCM::DeviceControl::ForbiddenPidRange_t`
- struct `DCM::DeviceControl::OutTS_NitInPat_t`

NIT in PAT setting for specific TS.

- struct `DCM::DeviceControl::PriorityBitMode_t`

Compact CA descriptor setting (per input TS)

- struct `DCM::DeviceControl::InTS_PriorityBit_t`

Information to change the priority bit of the MPEG packets of an incoming TS.

- struct `DCM::DeviceControl::IPS_OutputTS_LT_t`
- struct `DCM::DeviceControl::IPS_OutputTS_LT_V2_t`
- struct `DCM::DeviceControl::PortTsSvcProps_t`

Typedefs

- typedef sequence< IPS_RefTS_t > DCM::DeviceControl::IPS_RefTS_List_t
A sequence of *IPS_RefTS_t*.
- typedef sequence< unsigned long > DCM::DeviceControl::Ref_List_t
List of Ref's (In this case TS index's) to allow filtering.
- typedef sequence < Debug_Gbe_InputTS_t > DCM::DeviceControl::Debug_Gbe_InputTS_List_t
A sequence of *IPS_Gbe_InputTS_t* entries.
- typedef sequence< IPS_InputTS_t > DCM::DeviceControl::IPS_InputTS_List_t
A sequence of *IPS_InputTS_t* entries.
- typedef sequence < IPS_Gbe_InputTS_t > DCM::DeviceControl::IPS_Gbe_InputTS_List_t
A sequence of *IPS_Gbe_InputTS_t* entries.
- typedef sequence < IPS_ChangeInputTS_t > DCM::DeviceControl::IPS_ChangeInputTS_List_t
A sequence of *IPS_ChangeInputTS_t* entries.
- typedef sequence < Debug_Gbe_OutputTS_t > DCM::DeviceControl::Debug_Gbe_OutputTS_List_t
A sequence of *Debug_Gbe_OutputTS_t* entries.
- typedef sequence< IPS_OutputTS_t > DCM::DeviceControl::IPS_OutputTS_List_t
A sequence of *IPS_OutputTS_t* entries.
- typedef sequence < IPS_OutputTS_V2_t > DCM::DeviceControl::IPS_OutputTS_List_V2_t
A sequence of *IPS_OutputTS_V2_t* entries.
- typedef sequence< IPS_LookupTS_t > DCM::DeviceControl::IPS_LookupTS_List_t
A sequence of *IPS_LookupTS_t* entries.
- typedef sequence < IPS_ReferenceTS_t > DCM::DeviceControl::IPS_ReferenceTS_List_t
A sequence of *IPS_ReferenceTS_t* entries.
- typedef sequence < IPS_OutPID_Data_t > DCM::DeviceControl::IPS_OutPID_DataList_t
A sequence of *IPS_OutPID_Data_t*.
- typedef sequence < IPS_OutPID_Data2_t > DCM::DeviceControl::IPS_OutPID_Data2List_t
A sequence of *IPS_OutPID_Data2_t*.
- typedef sequence < IPS_InPID_Data_t > DCM::DeviceControl::IPS_In_PID_List_t
A sequence of *IPS_InPID_Data_t*.
- typedef sequence < IPS_InPID_Data_V2_t > DCM::DeviceControl::IPS_In_PID_List_V2_t
A sequence of *IPS_InPID_Data_V2_t*.
- typedef sequence< InEMM_Ref_t > DCM::DeviceControl::InEMM_RefList_t
A sequence of *InEMM_Ref_t*.
- typedef sequence< EMM_Data_t > DCM::DeviceControl::EMM_DataList_t
a sequence of *EMM_Data_t*
- typedef sequence < SI_Table_Period_t > DCM::DeviceControl::SI_Table_Period_List_t
- typedef sequence < SI_Table_GenerationMode_t > DCM::DeviceControl::SI_Table_Generation-Mode_List_t
- typedef sequence < TS_SI_Table_Periods_t > DCM::DeviceControl::TS_SI_Table_Periods_List_t
- typedef sequence< TableKeys_t > DCM::DeviceControl::TableKeys_List_t
- typedef sequence< TOT_Timezone_t > DCM::DeviceControl::TOT_Timezone_List_t
- typedef sequence < TS_TOT_Timezone_t > DCM::DeviceControl::TS_TOT_Timezone_List_t
- typedef sequence< char > DCM::DeviceControl::RoutingFileData_t
- typedef sequence < RoutingStatusRecord_t > DCM::DeviceControl::RoutingStatusRecord_List_t
- typedef sequence< char > DCM::DeviceControl::charSequence

- typedef sequence< IPS_RefPid_t > DCM::DeviceControl::IPS_RefPidList_t
A sequence of [IPS_RefPid_t](#).
- typedef sequence< unsigned short > DCM::DeviceControl::PID_List_t
PID range: 0..8190.
- typedef sequence< CompPidES_t > DCM::DeviceControl::CompPidESList_t
A sequence of [CompPidES_t](#).
- typedef sequence< CompPidES_V2_t > DCM::DeviceControl::CompPidESList_V2_t
A sequence of [CompPidES_V2_t](#).
- typedef sequence < TS_AutoPassRules > DCM::DeviceControl::TS_AutoPassRules_List_t
A sequence of [TS_AutoPassRules](#).
- typedef sequence < SI_AutoPassRules_t > DCM::DeviceControl::SI_AutoPassRules_List_t
- typedef sequence < OutTS_InsertCATDescriptors_t > DCM::DeviceControl::OutTS_InsertCAT-
Descriptors_List_t
- typedef sequence < InTS_TimeBaseSelectionMode_t > DCM::DeviceControl::InTS_TimeBaseSelection-
Mode_List_t
- typedef sequence < InTS_TimeBaseSelectionMode_V2_t > DCM::DeviceControl::InTS_TimeBase-
SelectionMode_List_V2_t
- typedef sequence < InTsExistenceReasons_t > DCM::DeviceControl::InTsExistenceReasonsList_
t
A sequence of [InTsExistenceReasons_t](#).
- typedef sequence < GbeIO_IP_Settings_t > DCM::DeviceControl::GbeIO_IP_Settings_List_t
A sequence of [GbeIO_IPv6_t](#) entries.
- typedef sequence < ForbiddenPidRange_t > DCM::DeviceControl::ForbiddenPidRange_List_t
A sequence of [ForbiddenPidRange_t](#) entries.
- typedef sequence < OutTS_NitInPat_t > DCM::DeviceControl::OutTS_NitInPat_List_t
- typedef sequence < InTS_PriorityBit_t > DCM::DeviceControl::InTS_PriorityBit_List_t
A sequence of [ChangePrioBitInputTS_t](#) entries.
- typedef sequence < IPS_OutputTS_LT_t > DCM::DeviceControl::IPS_OutputTS_LT_List_t
A sequence of [IPS_OutputTS_LT_t](#) entries.
- typedef sequence < IPS_OutputTS_LT_V2_t > DCM::DeviceControl::IPS_OutputTS_LT_List_
V2_t
A sequence of [IPS_OutputTS_LT_V2_t](#) entries.
- typedef sequence < PortTsSvcProps_t > DCM::DeviceControl::PortTsSvcProps_List_t
- typedef sequence < enOperatingMode_t > DCM::DeviceControl::OperatingMode_List_t

Enumerations

- enum DCM::DeviceControl::eIPS_IncrScheme { DCM::DeviceControl::IPS_Incr_IP, DCM::Device-
Control::IPS_Incr_Port1, DCM::DeviceControl::IPS_Incr_Port2, DCM::DeviceControl::IPS_Incr_
IP1_Port1 }
Used by [IPS_OutDefaultsSet\(\)](#) and [IPS_OutDefaultsGet\(\)](#) indicating how the next socket must be generated.
- enum DCM::DeviceControl::eEsTypeStandard { DCM::DeviceControl::eTransparent, DCM::Device-
Control::eDVB, DCM::DeviceControl::eATSC, DCM::DeviceControl::eMOTOROLA, DCM::Device-
Control::eForceUplink, DCM::DeviceControl::eForceVideo, DCM::DeviceControl::eForceAudio3 }
- Transport stream type to guide interpretation and play out of elementary stream types.*
- enum DCM::DeviceControl::eIPS_StreamingState { DCM::DeviceControl::IPS_Streaming_Active,
DCM::DeviceControl::IPS_Streaming_Paused }

Describes if the TS is streaming or not.

- enum `DCM::DeviceControl::enStreamingSetting_t` { `DCM::DeviceControl::eStreamingSetting_On`, `DCM::DeviceControl::eStreamingSetting_Off`, `DCM::DeviceControl::eStreamingSetting_Auto`, `DCM::DeviceControl::eStreamingSetting_Reserved4`, `DCM::DeviceControl::eStreamingSetting_Reserved5`, `DCM::DeviceControl::eStreamingSetting_Reserved6`, `DCM::DeviceControl::eStreamingSetting_Reserved7`, `DCM::DeviceControl::eStreamingSetting_Reserved8`, `DCM::DeviceControl::eStreamingSetting_Reserved9`, `DCM::DeviceControl::eStreamingSetting_Reserved10` }

Describes when the TS should stream.

- enum `DCM::DeviceControl::ePID_Type` { `DCM::DeviceControl::ePID_TypeEMM`, `DCM::DeviceControl::ePID_TypeUnref`, `DCM::DeviceControl::ePID_TypeForced`, `DCM::DeviceControl::ePID_TypePrivateDataEMMG` }

PID types.

- enum `DCM::DeviceControl::eMpegStandard` { `DCM::DeviceControl::eStdMpeg2`, `DCM::DeviceControl::eStdDvb`, `DCM::DeviceControl::eStdATSC` }
- enum `DCM::DeviceControl::ePIDPassingStatus` { `DCM::DeviceControl::ePID_StatusBlockedByUser`, `DCM::DeviceControl::ePID_StatusPassed`, `DCM::DeviceControl::ePID_StatusGenerated`, `DCM::DeviceControl::ePID_StatusBlockedBySystem`, `DCM::DeviceControl::ePID_StatusNotPassed`, `DCM::DeviceControl::ePID_StatusTransparent`, `DCM::DeviceControl::ePID_StatusTransparentRegeneration`, `DCM::DeviceControl::ePID_StatusStopped`, `DCM::DeviceControl::ePID_StatusBlockedByDPI`, `DCM::DeviceControl::ePID_StatusBlockedByTsRule`, `DCM::DeviceControl::ePID_StatusBlockedBySvcRule` }

Pid passing and blocking statuses.

- enum `DCM::DeviceControl::ePIDPassingStatus_V2` { `DCM::DeviceControl::ePID_Status_V2_BlockedByUser`, `DCM::DeviceControl::ePID_Status_V2_Passed`, `DCM::DeviceControl::ePID_Status_V2_Generated`, `DCM::DeviceControl::ePID_Status_V2_BlockedBySystem`, `DCM::DeviceControl::ePID_Status_V2_NotPassed`, `DCM::DeviceControl::ePID_Status_V2_Transparent`, `DCM::DeviceControl::ePID_Status_V2_TransparentRegeneration`, `DCM::DeviceControl::ePID_Status_V2_Stopped`, `×` `DCM::DeviceControl::ePID_Status_V2_BlockedByDPI`, `DCM::DeviceControl::ePID_Status_V2_BlockedByTsRule`, `DCM::DeviceControl::ePID_Status_V2_BlockedBySvcRule`, `DCM::DeviceControl::ePID_Status_V2_AutoPassed`, `DCM::DeviceControl::ePID_Status_V2_Reserved12`, `DCM::DeviceControl::ePID_Status_V2_Reserved13`, `DCM::DeviceControl::ePID_Status_V2_Reserved14`, `DCM::DeviceControl::ePID_Status_V2_Reserved15`, `DCM::DeviceControl::ePID_Status_V2_Reserved16`, `DCM::DeviceControl::ePID_Status_V2_Reserved17`, `DCM::DeviceControl::ePID_Status_V2_Reserved18`, `DCM::DeviceControl::ePID_Status_V2_Reserved19`, `DCM::DeviceControl::ePID_Status_V2_Reserved20`, `DCM::DeviceControl::ePID_Status_V2_Reserved21`, `DCM::DeviceControl::ePID_Status_V2_Reserved22`, `DCM::DeviceControl::ePID_Status_V2_Reserved23`, `DCM::DeviceControl::ePID_Status_V2_Reserved24`, `DCM::DeviceControl::ePID_Status_V2_Reserved25`, `DCM::DeviceControl::ePID_Status_V2_Reserved26`, `DCM::DeviceControl::ePID_Status_V2_Reserved27`, `DCM::DeviceControl::ePID_Status_V2_Reserved28`, `DCM::DeviceControl::ePID_Status_V2_Reserved29`, `DCM::DeviceControl::ePID_Status_V2_Reserved30`, `DCM::DeviceControl::ePID_Status_V2_Reserved31`, `DCM::DeviceControl::ePID_Status_V2_Reserved32`, `DCM::DeviceControl::ePID_Status_V2_Reserved33`, `DCM::DeviceControl::ePID_Status_V2_Reserved34`, `DCM::DeviceControl::ePID_Status_V2_Reserved35`, `DCM::DeviceControl::ePID_Status_V2_Reserved36`, `DCM::DeviceControl::ePID_Status_V2_Reserved37`, `DCM::DeviceControl::ePID_Status_V2_Reserved38`, `DCM::DeviceControl::ePID_Status_V2_Reserved39` }

Pid passing and blocking statuses.

- enum `DCM::DeviceControl::eRoutingStatusResult` { `DCM::DeviceControl::eRoutingResultSuccess`, `DCM::DeviceControl::eRoutingStatusSuccessWithWarnings`, `DCM::DeviceControl::eRoutingStatusSuccessWithErrors`, `DCM::DeviceControl::eRoutingStatusFatalError` }

Result of routing file upload operation (pre-config - IPS_ProcessRoutingFile)

- enum `DCM::DeviceControl::eRoutingStatusSeverity` { `DCM::DeviceControl::eRoutingStatusWarning`, `DCM::DeviceControl::eRoutingStatusError`, `DCM::DeviceControl::eRoutingStatusFatal` }

Severity of error that occurred during routing file upload (pre-config - IPS_ProcessRoutingFile)

- enum `DCM::DeviceControl::eNitInPat` { `DCM::DeviceControl::NitInPatOff`, `DCM::DeviceControl::NitInPatOn`, `DCM::DeviceControl::NitInPatAuto` }
NIT in PAT mode.
- enum `DCM::DeviceControl::eInsertCATDescriptors` { `DCM::DeviceControl::eInsertCATDescriptorsOnlyGenerated`, `DCM::DeviceControl::eInsertCATDescriptorsGeneratedAndImported` }
Insert CAT Descriptors.
- enum `DCM::DeviceControl::eTimeBaseSelectionMode` { `DCM::DeviceControl::eTBS_Auto`, `DCM::DeviceControl::eTBS_AutoReferredPCR`, `DCM::DeviceControl::eTBS_ForcedPCR`, `DCM::DeviceControl::eTBS_CBR_Auto`, `DCM::DeviceControl::eTBS_CBR_AutoReferredPCR`, `DCM::DeviceControl::eTBS_CBR_ForcedPCR` }
- enum `DCM::DeviceControl::eTimeBaseSelectionMode_V2` { `DCM::DeviceControl::eTBS_V2_Auto`, `DCM::DeviceControl::eTBS_V2_AutoReferredPCR`, `DCM::DeviceControl::eTBS_V2_ForcedPCR`, `DCM::DeviceControl::eTBS_V2_CBR_Auto`, `DCM::DeviceControl::eTBS_V2_CBR_AutoReferredPCR`, `DCM::DeviceControl::eTBS_V2_CBR_ForcedPCR`, `DCM::DeviceControl::eTBS_V2_Reserved1`, `DCM::DeviceControl::eTBS_V2_Reserved2`, `DCM::DeviceControl::eTBS_V2_Reserved3`, `DCM::DeviceControl::eTBS_V2_Reserved4`, `DCM::DeviceControl::eTBS_V2_Reserved5`, `DCM::DeviceControl::eTBS_V2_Reserved6`, `DCM::DeviceControl::eTBS_V2_Reserved7`, `DCM::DeviceControl::eTBS_V2_Reserved8`, `DCM::DeviceControl::eTBS_V2_Reserved9` }
- enum `DCM::DeviceControl::ePriorityBitMode` { `DCM::DeviceControl::eTPB_Transparent`, `DCM::DeviceControl::eTPB_ForceToZero`, `DCM::DeviceControl::eTPB_ForceToOne` }
Input Transport stream setting that defines how the priority bit in the MPEG header of the incoming packets should be manipulated.

Functions

- `IPS_ReferenceTS_List_t DCM::DeviceControl::IPS_Lookup_TSs` (in unsigned short BoardNumber, in `IPS_LookupTS_List_t` LookUpTS_List) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed, OutOfRange)
Gets the TS indexes for a number of transport streams.
- `IPS_ReferenceTS_List_t DCM::DeviceControl::IPS_FindTSs` (in unsigned short BoardNumber, in `IPS_LookupTS_List_t` LookUpTS_List) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Gets the TS indexes for a number of transport streams.
- `void DCM::DeviceControl::ReserveInputTS` (in `IPS_RefTS_t` TS, in unsigned long Reserve) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Reserves input TS If a TS is created and not used (no services or PIDs passed from that TS or TS has no input settings) and the TS is not present at the input, it will be deleted after two minutes.
- `IPS_InputTS_List_t DCM::DeviceControl::IPS_InTS_GetL` (in `IPS_Ref_t` PhysRef, in `Ref_List_t` RefList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get a list of incoming transport streams.
- `IPS_Gbe_InputTS_List_t DCM::DeviceControl::IPS_Gbe_InTS_GetL` (in `IPS_Ref_t` PhysRef, in `Ref_List_t` RefList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get a list of Gbe information of incoming transport streams.
- `Debug_Gbe_InputTS_List_t DCM::DeviceControl::DebugGbeStreamInGetL` (in `IPS_Ref_t` PhysRef, in `Ref_List_t` RefList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get a list of Gbe information of incoming transport streams.
- `void DCM::DeviceControl::InputTsExistenceGetL` (in `IPS_Ref_t` RefPhys, in `IPS_RefTS_List_t` RefTsList, out `InTsExistenceReasonsList_t` lst) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get reason of existence for some input TS.

- Debug_Gbe_OutputTS_List_t [DCM::DeviceControl::DebugGbeStreamOutGetL](#) (in IPS_Ref_t RefPhys, in Ref_List_t RefList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get a list of Gbe information of outgoing transport streams.
- void [DCM::DeviceControl::IPS_OutTS_AddL](#) (in IPS_Ref_t RefPhys, in unsigned long NbrOutTS, out IPS_OutputTS_List_t OutputTSList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Create a number of TS on given Slot and Port based on the defined defaults ([IPS_OutDefaultsSet\(\)](#), [IPS_OutDefaultsGet\(\)](#)).
- void [DCM::DeviceControl::IPS_OutTS_AddL_V2](#) (in IPS_Ref_t RefPhys, in unsigned long NbrOutTS, out IPS_OutputTS_List_V2_t OutputTSList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Create a number of TS on given Slot and Port based on the defined defaults ([IPS_OutDefaultsSet\(\)](#), [IPS_OutDefaultsGet\(\)](#)).
- void [DCM::DeviceControl::IPS_OutTS_ChangeL](#) (in IPS_Ref_t RefPhys, in IPS_OutputTS_List_t OutputTSList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)
Change the parameters of one or more existing outgoing TS.
- void [DCM::DeviceControl::IPS_OutTS_ChangeL_V2](#) (in IPS_Ref_t RefPhys, in IPS_OutputTS_List_V2_t OutputTSList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)
Change the parameters of one or more existing outgoing TS.
- void [DCM::DeviceControl::IPS_InTS_ChangeL](#) (in IPS_Ref_t RefPhys, in IPS_ChangeInputTS_List_t InputTSList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Change the parameters of one or more existing incoming TS.
- IPS_OutputTS_List_t [DCM::DeviceControl::IPS_OutTS_GetL](#) (in IPS_Ref_t RefPhys, in Ref_List_t RefList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get a list of outgoing transport streams and their parameters.
- IPS_OutputTS_List_V2_t [DCM::DeviceControl::IPS_OutTS_GetL_V2](#) (in IPS_Ref_t RefPhys, in Ref_List_t RefList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get a list of outgoing transport streams and their parameters.
- void [DCM::DeviceControl::GbeIO_OutStreamIP_ChangeL](#) (in IPS_Ref_t RefPhys, in GbeIO_IP_Settings_List_t OutputGbeIO_StreamList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)
Change the IPv4 or IPv6 header parameters of one or more existing outgoing Gbe IO streams.
- GbeIO_IP_Settings_List_t [DCM::DeviceControl::GbeIO_OutStreamIP_GetL](#) (in IPS_Ref_t RefPhys, in Ref_List_t RefList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get the IPv4 or IPv6 parameters for a list of outgoing transport streams.
- IPS_OutputTS_List_t [DCM::DeviceControl::IPS_OutTS_GetFilteredL](#) (in IPS_Ref_t RefPhys, in Ref_List_t RefList, in boolean ScrambledOnly) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get a filtered list of outgoing transport streams and their parameters.
- IPS_OutputTS_List_V2_t [DCM::DeviceControl::IPS_OutTS_GetFilteredL_V2](#) (in IPS_Ref_t RefPhys, in Ref_List_t RefList, in boolean ScrambledOnly) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get a filtered list of outgoing transport streams and their parameters.
- void [DCM::DeviceControl::IPS_OutTS_DeleteL](#) (in IPS_Ref_t RefPhys, in IPS_RefTS_List_t RefList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Delete a list of TSs.

- void **DCM::DeviceControl::IPS_OutDefaultsSet** (in IPS_Ref_t RefPhys, in IPS_UDP_Socket_t - Socket, in long lBirate, in eIPS_IncrScheme Incr) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set defaults for new TS created with IPS_OutTS_AddL().

- void **DCM::DeviceControl::IPS_OutDefaultsGet** (in IPS_Ref_t RefPhys, out IPS_UDP_Socket_t - Socket, out long lBirate, out eIPS_IncrScheme Incr) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get current set of defaults for a new TS.

- void **DCM::DeviceControl::SetDefault_SourceUdp** (in unsigned short Board, in unsigned short - SourceUdp) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the default source UDP port number for a new TS.

- void **DCM::DeviceControl::GetDefault_SourceUdp** (in unsigned short Board, out unsigned short - SourceUdp) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the current default source UDP port number for a new TS.

- void **DCM::DeviceControl::IPS_SetDefaultStandard** (in IPS_Ref_t RefPhys, in eEsTypeStandard eIn, in eEsTypeStandard eOut) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set defaults eEsTypeStandard for input and output for new TS.

- void **DCM::DeviceControl::IPS_GetDefaultStandard** (in IPS_Ref_t RefPhys, out eEsTypeStandard eIn, out eEsTypeStandard eOut) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get current default eEsTypeStandard for input and output.

- void **DCM::DeviceControl::GetSI_DefaultPayoutPeriods** (in IPS_Ref_t RefPhys, out SI_Table_Period_List_t Periods) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

this gets the current defaults for all supported SI tables

- void **DCM::DeviceControl::SetSI_DefaultPayoutPeriods** (in IPS_Ref_t RefPhys, in SI_Table_Period_List_t Periods) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)

this sets the defaults for any subset of the supported SI tables (or for all)

- void **DCM::DeviceControl::OutTS_GetSI_PayoutPeriods** (in IPS_Ref_t RefPhys, in IPS_RefTS_List_t TS_List, out TS_SI_Table_Periods_List_t Periods) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

this gets the payout periods for all supported SI tables for one or more TS

- void **DCM::DeviceControl::OutTS_SetSI_PayoutPeriods** (in IPS_Ref_t RefPhys, in TS_SI_Table_Periods_List_t Periods) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)

this gets the payout periods for all supported SI tables for one or more TS

- void **DCM::DeviceControl::GetSI_DefaultGenerationModes** (in IPS_Ref_t RefPhys, out SI_Table_GenerationMode_List_t Modes) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)

This gets the default generation mode of all supported SI tables for one or more TS.

- void **DCM::DeviceControl::SetSI_DefaultGenerationModes** (in IPS_Ref_t RefPhys, in SI_Table_GenerationMode_List_t Modes) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)

This sets the default generation mode of all supported SI tables for one or more TS.

- void **DCM::DeviceControl::SetTOT_Timezones** (in IPS_Ref_t RefPhys, in TS_TOT_Timezone_List_t Timezones) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)

This sets the TOT descriptor timezones for one or more TS's.

- void [DCM::DeviceControl::GetTOT_Timezones](#) (in IPS_Ref_t RefPhys, in IPS_RefTS_List_t TS_List, out TS_TOT_Timezone_List_t Timezones) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)

This gets the TOT descriptor timezones for one or more TS's.

- void [DCM::DeviceControl::IPS_OutPID_GetL](#) (in IPS_RefTS_t RefTS, in ePID_Type PID_Type, out IPS_OutPID_Data2List_t PID_DataList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the list of PID's on a OutputTS.

- void [DCM::DeviceControl::IPS_InPID_GetL](#) (in IPS_RefTS_t RefTS, in ePID_Type PID_Type, out IPS_In_PID_List_t PID_DataList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the list of PID's on a InputTS.

- void [DCM::DeviceControl::IPS_InPID_GetL_V2](#) (in IPS_RefTS_t RefTS, in ePID_Type PID_Type, out IPS_In_PID_List_V2_t PID_DataList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the list of PID's on a InputTS (including property bits).

- void [DCM::DeviceControl::IPS_OutEMM_AddL](#) (in IPS_RefTS_t RefTS_Out, in InEMM_RefList_t PID_DataList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Routes a number of EMM pids to an output TS.

- void [DCM::DeviceControl::IPS_OutEMM_DelL](#) (in IPS_RefTS_t RefTS_Out, in InEMM_RefList_t PID_DataList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Removes the routing for a number of EMM pids to an output TS.

- void [DCM::DeviceControl::InEMM_GetL](#) (in InEMM_RefList_t EMM_RefList, out EMM_DataList_t EMM_DataList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the list of additional information of all EMM's/PD's at the output.

- void [DCM::DeviceControl::SetDefaultForbiddenPidRanges](#) (in unsigned short SlotNumber, in ForbiddenPidRange_List_t RangeList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Sets a number of default Forbidden Output PID ranges (PIDs that may not be used at the Output).

- void [DCM::DeviceControl::GetDefaultForbiddenPidRanges](#) (in unsigned short SlotNumber, out ForbiddenPidRange_List_t RangeList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the default forbidden pid ranges.

- void [DCM::DeviceControl::SetForbiddenPidRanges](#) (in IPS_RefTS_t RefTS, in ForbiddenPidRange_List_t RangeList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Sets a number of Forbidden Output PID ranges (PIDs that may not be used at the Output).

- void [DCM::DeviceControl::GetForbiddenPidRanges](#) (in IPS_RefTS_t RefTS, out ForbiddenPidRange_List_t RangeList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the forbidden pid ranges for a specific output transport stream.

- void [DCM::DeviceControl::IPS_OutPID_AddL](#) (in IPS_Ref_t RefPhys, in IPS_OutPID_DataList_t PID_DataList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Passes a list of (unreferenced) PID's to an OutputTS.

- void [DCM::DeviceControl::IPS_OutPID_DeleteL](#) (in IPS_Ref_t RefPhys, in IPS_OutPID_DataList_t PID_DataList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Deletes the list of PID's on a OutputTS.

- void [DCM::DeviceControl::IPS_ProcessRoutingFile](#) (in RoutingFileData_t FileData) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Process the upload of a routing file.

- void [DCM::DeviceControl::IPS_RoutingFileProgress](#) (out boolean Finished, out long CurrentValue, out long TotalValue) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Indicates the progress of the upload of a routing file.

- void **DCM::DeviceControl::IPS_RoutingFileStatus** (out eRoutingStatusResult Result, out RoutingStatusRecord_List_t StatusRecords) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Indicates the status of the upload of a routing file.

- void **DCM::DeviceControl::IPS_RetrieveRoutingFile** (in char Separator, in char DecimalPoint, in charSequence EOLMarker, out RoutingFileData_t FileData) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Retrieve the current routing in CSV format.

- void **DCM::DeviceControl::OutTS_GetTSAutoPassRules** (in IPS_RefTS_t RefOutTS, out TS_AutoPassRules_List_t AutoPassRulesList, out TS_AutoPassRulesDisableFlags AutoPassRulesDisableFlags) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the Auto Pass Rules for an Output TS (MPTS Pass Through).

- void **DCM::DeviceControl::OutTS_SetTSAutoPassRules** (in IPS_RefTS_t RefOutTS, in TS_AutoPassRules_List_t AutoPassRulesList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the Auto Pass Rules for an Output TS (MPTS Pass Through).

- void **DCM::DeviceControl::SetDefaultAutoPassRules** (in unsigned short BoardNr, in DefaultAutoPassRules rules) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the board default auto pass rules for service component passing.

- void **DCM::DeviceControl::GetDefaultAutoPassRules** (in unsigned short BoardNr, out DefaultAutoPassRules rules) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the board default auto pass rules for service component passing.

- void **DCM::DeviceControl::OutTS_GetServiceAutoPassRules** (in IPS_RefTS_t RefOutTS, out Service_AutoPassRules AutoPassRules) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get current service component auto pass rules.

- void **DCM::DeviceControl::OutTS_SetServiceAutoPassRules** (in IPS_RefTS_t RefOutTS, in Service_AutoPassRules AutoPassRules) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set service component auto pass rules.

- void **DCM::DeviceControl::OutTS_SetSubtableAutoPass** (in IPS_RefTS_t RefOutTS, in SI_AutoPassRules_List_t SI_AutoPassRules_List) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set SI subtable auto pass rules.

- void **DCM::DeviceControl::OutTS_GetSubtableAutoPass** (in IPS_RefTS_t RefOutTS, out SI_AutoPassRules_List_t SI_AutoPassRules_List) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get current SI subtable auto pass rules.

- void **DCM::DeviceControl::OutTS_NitInPat_SetL** (in IPS_Ref_t RefPhys, in OutTS_NitInPat_List_t OutTS_NitInPat_List) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set TS NIT in PAT mode.

- void **DCM::DeviceControl::OutTS_NitInPat_GetL** (in IPS_Ref_t RefPhys, in IPS_RefTS_List_t - RefTsList, out OutTS_NitInPat_List_t OutTS_NitInPat_List) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get TS NIT in PAT mode.

- void **DCM::DeviceControl::SetDefault_NitInPat** (in unsigned short BoardNumber, in eNitInPat NitInPat) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set default Nit in PAT mode settings to be used for newly created output TSs Defaults are attached to a board.

- void [DCM::DeviceControl::GetDefault_NitInPat](#) (in unsigned short BoardNumber, out eNitInPat - NitInPat) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get default Nit in Pat mode setting Defaults are attached to a board.
- void [DCM::DeviceControl::OutTS_InsertCATDescriptors_SetL](#) (in IPS_Ref_t RefPhys, in OutTS_InsertCATDescriptors_List_t OutTS_InsertCATDescriptors_List) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)
Set TS Insert CAT Descriptors mode.
- void [DCM::DeviceControl::OutTS_InsertCATDescriptors_GetL](#) (in IPS_Ref_t RefPhys, in IPS_RefTS_List_t RefTsList, out OutTS_InsertCATDescriptors_List_t OutTS_InsertCATDescriptors_List) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)
Get TS Insert CAT Descriptors mode.
- void [DCM::DeviceControl::SetDefault_InsertCATDescriptors](#) (in unsigned short BoardNumber, in eInsertCATDescriptors InsertCATDescriptors) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)
Set default Insert CAT Descriptors mode settings to be used for newly created output TSs Defaults are attached to a board.
- void [DCM::DeviceControl::GetDefault_InsertCATDescriptors](#) (in unsigned short BoardNumber, out eInsertCATDescriptors InsertCATDescriptors) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)
Get default Insert CAT Descriptors mode setting Defaults are attached to a board.
- void [DCM::DeviceControl::TimeBaseSelectionMode_SetL](#) (in IPS_Ref_t RefPhys, in InTS_TimeBaseSelectionMode_List_t TBS_List) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Set the Time Base Selection Mode for a list of input TSs.
- void [DCM::DeviceControl::TimeBaseSelectionMode_GetL](#) (in IPS_Ref_t RefPhys, in IPS_RefTS_List_t RefTsList, out InTS_TimeBaseSelectionMode_List_t TBS_List) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get the Time Base Selection Mode for a list of input TSs.
- void [DCM::DeviceControl::TimeBaseSelectionMode_DeL](#) (in IPS_Ref_t RefPhys, in IPS_RefTS_List_t RefTsList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Revert the Time Base Selection Mode to default for a list of input TSs.
- void [DCM::DeviceControl::SetDefaultTimeBaseSelectionMode](#) (in unsigned short BoardNumber, in eTimeBaseSelectionMode TBS_Mode) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Set default Time Base Selection Mode to be used for newly created input TSs.
- void [DCM::DeviceControl::GetDefaultTimeBaseSelectionMode](#) (in unsigned short BoardNumber, out eTimeBaseSelectionMode TBS_Mode) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get default Time Base Selection Mode that is used for newly created input TSs.
- void [DCM::DeviceControl::BoardDejitterCfgSet](#) (in unsigned short BoardNumber, in BoardDejitterCfg_t CfgIn) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Set the board default VBR and CBR latency.
- void [DCM::DeviceControl::BoardDejitterCfgGet](#) (in unsigned short BoardNumber, out BoardDejitterCfg_t CfgOut) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get the board default VBR and CBR latency.
- void [DCM::DeviceControl::TimeBaseSelectionMode_V2_SetL](#) (in IPS_Ref_t RefPhys, in InTS_TimeBaseSelectionMode_List_V2_t TBS_List) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)
Set the Time Base Selection Mode for a list of input TSs.

- void `DCM::DeviceControl::TimeBaseSelectionMode_V2_GetL` (in `IPS_Ref_t RefPhys`, in `IPS_RefTS_List_t RefTsList`, out `InTS_TimeBaseSelectionMode_List_V2_t TBS_List`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Get the Time Base Selection Mode for a list of input TSs.

- void `DCM::DeviceControl::SetDefaultTBSMode_V2` (in unsigned short BoardNumber, in `eTimeBaseSelectionMode_V2 TBS_Mode`, in boolean FastLock) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set default Time Base Selection Mode to be used for newly created input TSs.

- void `DCM::DeviceControl::GetDefaultTBSMode_V2` (in unsigned short BoardNumber, out `eTimeBaseSelectionMode_V2 TBS_Mode`, out boolean FastLock) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get default Time Base Selection Mode that is used for newly created input TSs.

- void `DCM::DeviceControl::InTS_PriorityBits_SetL` (in `IPS_Ref_t RefPhys`, in `InTS_PriorityBit_List_t InTS_PriorityBit_List`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

Change the transport priority bit behavior for one or more existing incoming TS.

- `InTS_PriorityBit_List_t DCM::DeviceControl::InTS_PriorityBits_GetL` (in `IPS_Ref_t RefPhys`, in `IPS_RefTS_List_t RefTsList`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the list of transport priority bit settings for a number of incoming transport streams.

- void `DCM::DeviceControl::InTS_PriorityBits_DelL` (in `IPS_Ref_t RefPhys`, in `IPS_RefTS_List_t RefTsList`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

Revert the Priority Bit setting to default for a list of input TSs.

- void `DCM::DeviceControl::SetDefaultPriorityBit` (in unsigned short SlotNbr, in `ePriorityBitMode PriorityBitSetting`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

Set default priority setting for new input TS.

- void `DCM::DeviceControl::GetDefaultPriorityBit` (in unsigned short SlotNbr, out `ePriorityBitMode PriorityBitSetting`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get current default PrioBitSetting.

- void `DCM::DeviceControl::SetPassMotorolaTables` (in unsigned short BoardNumber, in boolean Pass) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the Pass Motorola C0/C1 table setting.

- void `DCM::DeviceControl::GetPassMotorolaTables` (in unsigned short BoardNumber, out boolean Pass) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get current Pass Motorola C0/C1 table setting.

- void `DCM::DeviceControl::IPS_OutTS_LT_AddL` (in `IPS_Ref_t RefPhys`, in `IPS_OutputTS_LT_List_t OutputTSList`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Create a number of Transparent Loop Through TSs on given Slot and Port.

- void `DCM::DeviceControl::IPS_OutTS_LT_AddL_V2` (in `IPS_Ref_t RefPhys`, in `IPS_OutputTS_LT_List_V2_t OutputTSList`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Create a number of Transparent Loop Through TSs on given Slot and Port.

- void `DCM::DeviceControl::IPS_OutTS_LT_ChangeL` (in unsigned short BoardNumber, in `IPS_OutputTS_LT_List_t OutputTSList`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Change the parameters of one or more existing outgoing TS.

- void `DCM::DeviceControl::IPS_OutTS_LT_ChangeL_V2` (in unsigned short BoardNumber, in `IPS_OutputTS_LT_List_V2_t OutputTSList`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Change the parameters of one or more existing outgoing TS.

- `IPS_OutputTS_LT_List_t DCM::DeviceControl::IPS_OutTS_LT_GetL` (in `IPS_Ref_t RefPhys`, in `Ref_List_t RefList`) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get a list of outgoing Transparent Loop Through TSs and their parameters.

- `IPS_OutputTS_LT_List_V2_t DCM::DeviceControl::IPS_OutTS_LT_GetL_V2` (in `IPS_Ref_t RefPhys`, in `Ref_List_t RefList`) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get a list of outgoing Transparent Loop Through TSs and their parameters.

- `PortTsSvcProps_List_t DCM::DeviceControl::PortInTsSvcPropsGetL` (in `IPS_Ref_t RefPhys`) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Get the aggregated TS and Service Properties per Input Port.

- `PortTsSvcProps_List_t DCM::DeviceControl::PortOutTsSvcPropsGetL` (in `IPS_Ref_t RefPhys`) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Get the aggregated TS and Service Properties per Output Port.

- `IPS_OutputTS_List_V2_t DCM::DeviceControl::IPS_OutTS_GetFilteredL_V3` (in `IPS_Ref_t RefPhys`, in `Ref_List_t RefList`, in boolean `ScrambledOnly`, in `OperatingMode_List_t OperatingModes`) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Get a filtered list of outgoing transport streams and their parameters.

Variables

- const unsigned long `DCM::DeviceControl::INVALID_REF` = 0xffffffff

Undefined Ref.

- const unsigned long `DCM::DeviceControl::ANY_REF` = 0xffffffff

Only for input parameters.

- const unsigned long `DCM::DeviceControl::BITMAP_INPUT_TS_EMMS_PRESENT` = 0x1
- const unsigned long `DCM::DeviceControl::BITMAP_INPUT_TS_UNREF_PIDS_PRESENT` = 0x2
- const unsigned long `DCM::DeviceControl::BITMAP_INPUT_TS_PRIV_DATA_EMMG` = 0x4
- const unsigned long `DCM::DeviceControl::BITMAP_INPUT_TS_RTP_ON` = 0x8
- const unsigned long `DCM::DeviceControl::BITMAP_INPUT_TS_VLAN_ON` = 0x10

May be senseless on input but let's try to be symmetrically.

- const unsigned long `DCM::DeviceControl::BITMAP_INPUT_TS_VBR_ON` = 0x20

May be senseless on input but let's try to be symmetrically.

- const unsigned long `DCM::DeviceControl::BITMAP_INPUT_TS_ROUTED` = 0x40

Will be set when any component is routed to an output.

- const unsigned long `DCM::DeviceControl::BITMAP_INPUT_TS_INPUT_PRESENT` = 0x80

Will be set when there is signal detected.

- const unsigned long `DCM::DeviceControl::BITMAP_INPUT_TS_ALARM_ACTIVE` = 0x100

Will be set when Asi sync Loss of UDP Stream Loss detected.

- const unsigned long `DCM::DeviceControl::BITMAP_INPUT_TS_FEC_COL_PRESENT` = 0x200

Will be set when FEC column stream is present.

- const unsigned long `DCM::DeviceControl::BITMAP_INPUT_TS_FEC_ROW_PRESENT` = 0x400

Will be set when FEC row stream is present.

- const unsigned long `DCM::DeviceControl::BITMAP_INPUT_TS_IN_BACKUP` = 0x800

Will be set when TS is in Backup.

- const unsigned long [DCM::DeviceControl::BITMAP_INPUT_TS_UNREF_PIDS_ROUTED](#) = 0x1000

Will be set when unreferenced PIDs are routed.

- const unsigned long [DCM::DeviceControl::BITMAP_INPUT_TS_TSLOSS_ALARM_ACTIVE](#) = 0x2000

Will be set when TsLoss Alarm is active (backup trigger).

- const unsigned long [DCM::DeviceControl::BITMAP_OUTPUT_TS_EMMS_PRESENT](#) = 0x1
- const unsigned long [DCM::DeviceControl::BITMAP_OUTPUT_TS_UNREF_PIDS_PRESENT](#) = 0x2
- const unsigned long [DCM::DeviceControl::BITMAP_OUTPUT_TS_PRIV_DATA_EMMG](#) = 0x4
- const unsigned long [DCM::DeviceControl::BITMAP_OUTPUT_TS_RTP_ON](#) = 0x8
- const unsigned long [DCM::DeviceControl::BITMAP_OUTPUT_TS_VLAN_ON](#) = 0x10
- const unsigned long [DCM::DeviceControl::BITMAP_OUTPUT_TS_VBR_ON](#) = 0x20
- const unsigned long [DCM::DeviceControl::BITMAP_OUTPUT_TS_FEC_COL_PRESENT](#) = 0x200

Will be set when FEC column stream is enabled.

- const unsigned long [DCM::DeviceControl::BITMAP_OUTPUT_TS_FEC_ROW_PRESENT](#) = 0x400

Will be set when FEC row stream is enabled.

8.8.1 Detailed Description

This contains types, enums and methods to configure the TSs of the multiplexer part in the device.

8.8.2 Typedef Documentation

8.8.2.1 typedef sequence<char> DCM::DeviceControl::charSequence

Definition at line 2808 of file DCM.idl.

8.8.2.2 typedef sequence<CompPidES_t> DCM::DeviceControl::CompPidESList_t

A sequence of [CompPidES_t](#).

Definition at line 2832 of file DCM.idl.

8.8.2.3 typedef sequence<CompPidES_V2_t> DCM::DeviceControl::CompPidESList_V2_t

A sequence of [CompPidES_V2_t](#).

Definition at line 2850 of file DCM.idl.

8.8.2.4 typedef sequence<Debug_Gbe_InputTS_t> DCM::DeviceControl::Debug_Gbe_InputTS_List_t

A sequence of [IPS_Gbe_InputTS_t](#) entries.

Definition at line 2391 of file DCM.idl.

8.8.2.5 typedef sequence<Debug_Gbe_OutputTS_t> DCM::DeviceControl::Debug_Gbe_OutputTS_List_t

A sequence of [Debug_Gbe_OutputTS_t](#) entries.

Definition at line 2455 of file DCM.idl.

8.8.2.6 typedef sequence< EMM_Data_t > DCM::DeviceControl::EMM_DataList_t

a sequence of [EMM_Data_t](#)

Definition at line 2645 of file DCM.idl.

8.8.2.7 typedef sequence<ForbiddenPidRange_t> DCM::DeviceControl::ForbiddenPidRange_List_t

A sequence of [ForbiddenPidRange_t](#) entries.

Definition at line 3727 of file DCM.idl.

8.8.2.8 typedef sequence<GbeIO_IP_Settings_t> DCM::DeviceControl::GbeIO_IP_Settings_List_t

A sequence of [GbeIO_IPv6_t](#) entries.

Definition at line 3317 of file DCM.idl.

8.8.2.9 typedef sequence< InEMM_Ref_t > DCM::DeviceControl::InEMM_RefList_t

A sequence of [InEMM_Ref_t](#).

Definition at line 2630 of file DCM.idl.

8.8.2.10 typedef sequence<InTS_PriorityBit_t> DCM::DeviceControl::InTS_PriorityBit_List_t

A sequence of [ChangePrioBitInputTS_t](#) entries.

Definition at line 4356 of file DCM.idl.

8.8.2.11 typedef sequence<InTS_TimeBaseSelectionMode_t> DCM::DeviceControl::InTS_TimeBaseSelectionMode_List_t

Deprecated Use V2 structure instead

Definition at line 3000 of file DCM.idl.

8.8.2.12 typedef sequence<InTS_TimeBaseSelectionMode_V2_t> DCM::DeviceControl::InTS_TimeBaseSelectionMode_List_V2_t

Definition at line 3002 of file DCM.idl.

8.8.2.13 typedef sequence<InTsExistenceReasons_t> DCM::DeviceControl::InTsExistenceReasons_List_t

A sequence of [InTsExistenceReasons_t](#).

Definition at line 3141 of file DCM.idl.

8.8.2.14 typedef sequence<IPS_ChangeInputTS_t> DCM::DeviceControl::IPS_ChangeInputTS_List_t

A sequence of [IPS_ChangeInputTS_t](#) entries.

Definition at line 2435 of file DCM.idl.

8.8.2.15 typedef sequence<IPS_Gbe_InputTS_t> DCM::DeviceControl::IPS_Gbe_InputTS_List_t

A sequence of [IPS_Gbe_InputTS_t](#) entries.

Definition at line 2432 of file DCM.idl.

8.8.2.16 `typedef sequence<IPS_InPID_Data_t> DCM::DeviceControl::IPS_In_PID_List_t`

A sequence of [IPS_InPID_Data_t](#).

Definition at line 2609 of file DCM.idl.

8.8.2.17 `typedef sequence<IPS_InPID_Data_V2_t> DCM::DeviceControl::IPS_In_PID_List_V2_t`

A sequence of [IPS_InPID_Data_V2_t](#).

Definition at line 2620 of file DCM.idl.

8.8.2.18 `typedef sequence<IPS_InputTS_t> DCM::DeviceControl::IPS_InputTS_List_t`

A sequence of [IPS_InputTS_t](#) entries.

Definition at line 2429 of file DCM.idl.

8.8.2.19 `typedef sequence<IPS_LookupTS_t> DCM::DeviceControl::IPS_LookupTS_List_t`

A sequence of [IPS_LookupTS_t](#) entries.

Definition at line 2549 of file DCM.idl.

8.8.2.20 `typedef sequence<IPS_OutPID_Data2_t> DCM::DeviceControl::IPS_OutPID_Data2List_t`

A sequence of [IPS_OutPID_Data2_t](#).

Definition at line 2600 of file DCM.idl.

8.8.2.21 `typedef sequence<IPS_OutPID_Data_t> DCM::DeviceControl::IPS_OutPID_DataList_t`

A sequence of [IPS_OutPID_Data_t](#).

Definition at line 2565 of file DCM.idl.

8.8.2.22 `typedef sequence<IPS_OutputTS_t> DCM::DeviceControl::IPS_OutputTS_List_t`

A sequence of [IPS_OutputTS_t](#) entries.

Definition at line 2488 of file DCM.idl.

8.8.2.23 `typedef sequence<IPS_OutputTS_V2_t> DCM::DeviceControl::IPS_OutputTS_List_V2_t`

A sequence of [IPS_OutputTS_V2_t](#) entries.

Definition at line 2528 of file DCM.idl.

8.8.2.24 `typedef sequence<IPS_OutputTS_LT_t> DCM::DeviceControl::IPS_OutputTS_LT_List_t`

A sequence of [IPS_OutputTS_LT_t](#) entries.

Definition at line 4471 of file DCM.idl.

8.8.2.25 `typedef sequence<IPS_OutputTS_LT_V2_t> DCM::DeviceControl::IPS_OutputTS_LT_List_V2_t`

A sequence of [IPS_OutputTS_LT_V2_t](#) entries.

Definition at line 4491 of file DCM.idl.

8.8.2.26 typedef sequence<IPS_ReferenceTS_t> DCM::DeviceControl::IPS_ReferenceTS_List_t

A sequence of [IPS_ReferenceTS_t](#) entries.

Definition at line 2552 of file DCM.idl.

8.8.2.27 typedef sequence<IPS_RefPid_t> DCM::DeviceControl::IPS_RefPidList_t

A sequence of [IPS_RefPid_t](#).

Definition at line 2818 of file DCM.idl.

8.8.2.28 typedef sequence<IPS_RefTS_t> DCM::DeviceControl::IPS_RefTS_List_t

A sequence of [IPS_RefTS_t](#).

Definition at line 2292 of file DCM.idl.

8.8.2.29 typedef sequence<enOperatingMode_t> DCM::DeviceControl::OperatingMode_List_t

Definition at line 28879 of file DCM.idl.

8.8.2.30 typedef sequence<OutTS_InsertCATDescriptors_t> DCM::DeviceControl::OutTS_InsertCATDescriptors_List_t

Definition at line 2931 of file DCM.idl.

8.8.2.31 typedef sequence<OutTS_NitInPat_t> DCM::DeviceControl::OutTS_NitInPat_List_t

Definition at line 4011 of file DCM.idl.

8.8.2.32 typedef sequence<unsigned short> DCM::DeviceControl::PID_List_t

PID range: 0..8190.

Definition at line 2821 of file DCM.idl.

8.8.2.33 typedef sequence<PortTsSvcProps_t> DCM::DeviceControl::PortTsSvcProps_List_t

Definition at line 4645 of file DCM.idl.

8.8.2.34 typedef sequence<unsigned long> DCM::DeviceControl::Ref_List_t

List of Ref's (In this case TS index's) to allow filtering.

Definition at line 2295 of file DCM.idl.

8.8.2.35 typedef sequence<char> DCM::DeviceControl::RoutingFileData_t

Definition at line 2779 of file DCM.idl.

8.8.2.36 typedef sequence<RoutingStatusRecord_t> DCM::DeviceControl::RoutingStatusRecord_List_t

Definition at line 2806 of file DCM.idl.

8.8.2.37 typedef sequence<SI_AutoPassRules_t> DCM::DeviceControl::SI_AutoPassRules_List_t

Definition at line 2910 of file DCM.idl.

8.8.2.38 typedef sequence<SI_Table_GenerationMode_t> DCM::DeviceControl::SI_Table_GenerationMode_List_t

Definition at line 2741 of file DCM.idl.

8.8.2.39 typedef sequence<SI_Table_Period_t> DCM::DeviceControl::SI_Table_Period_List_t

Definition at line 2733 of file DCM.idl.

8.8.2.40 typedef sequence<TableKeys_t> DCM::DeviceControl::TableKeys_List_t

Definition at line 2758 of file DCM.idl.

8.8.2.41 typedef sequence<TOT_Timezone_t> DCM::DeviceControl::TOT_Timezone_List_t

Definition at line 2768 of file DCM.idl.

8.8.2.42 typedef sequence<TS_AutoPassRules> DCM::DeviceControl::TS_AutoPassRules_List_t

A sequence of [TS_AutoPassRules](#).

Definition at line 2864 of file DCM.idl.

8.8.2.43 typedef sequence<TS_SI_Table_Periods_t> DCM::DeviceControl::TS_SI_Table_Periods_List_t

Definition at line 2748 of file DCM.idl.

8.8.2.44 typedef sequence<TS_TOT_Timezone_t> DCM::DeviceControl::TS_TOT_Timezone_List_t

Definition at line 2777 of file DCM.idl.

8.8.3 Enumeration Type Documentation

8.8.3.1 enum DCM::DeviceControl::eEsTypeStandard

Transport stream type to guide interpretation and play out of elementary stream types.

This was formerly known as eOutputStandard.

Enumerator:

- eTransparent* Can only be used as output standard.
- eDVB* Can only be used as input standard;.
- eATSC* Can only be used as input standard.
- eMOTOROLA* Can only be used as input standard; Also known as Digicypher-II.
- eForceUplink* Can only be used as output standard.
- eForceVideo* Can only be used as output standard; Previously known as SA mode.
- eForceAudio3* Can only be used as output standard.

Definition at line 2319 of file DCM.idl.

8.8.3.2 enum DCM::DeviceControl::eInsertCATDescriptors

Insert CAT Descriptors.

Enumerator:

eInsertCATDescriptorsOnlyGenerated Only when mode is generated.

eInsertCATDescriptorsGeneratedAndImported Also when imported (not when pure import)

Definition at line 2921 of file DCM.idl.

8.8.3.3 enum DCM::DeviceControl::eIPS_IncrScheme

Used by [IPS_OutDefaultsSet\(\)](#) and [IPS_OutDefaultsGet\(\)](#) indicating how the next socket must be generated.

Enumerator:

IPS_Incr_IP Take IP address + 1.

IPS_Incr_Port1 Take UDP port + 1.

IPS_Incr_Port2 Take UDP port + 2.

IPS_Incr_IP1_Port1 Take IP address + 1 and UDP port + 1.

Definition at line 2300 of file DCM.idl.

8.8.3.4 enum DCM::DeviceControl::eIPS_StreamingState

Describes if the TS is streaming or not.

Enumerator:

IPS_Streaming_Active

IPS_Streaming_Paused

Definition at line 2402 of file DCM.idl.

8.8.3.5 enum DCM::DeviceControl::eMpegStandard**Enumerator:**

eStdMpeg2

eStdDvb

eStdATSC

Definition at line 2647 of file DCM.idl.

8.8.3.6 enum DCM::DeviceControl::eNitInPat

NIT in PAT mode.

Enumerator:

NitInPatOff NIT never in PAT.

NitInPatOn NIT always in PAT.

NitInPatAuto NIT in PAT when present (NIT mode != blocked) (default default)

Definition at line 2913 of file DCM.idl.

8.8.3.7 enum DCM::DeviceControl::enStreamingSetting_t

Describes when the TS should stream.

Enumerator:

eStreamingSetting_On TS should stream.

eStreamingSetting_Off TS should not stream.

eStreamingSetting_Auto TS should stream except for:

- ASI port - Auto will stop streaming as long as TS Out Stream loss alarm is active.
- Gbe port - Auto will stop streaming as long as TS Out Stream loss alarm is active.
- ASI port in DTF - Auto will behave similar as On.
- For Transparent Loop Through TSs- Auto will behave similar as On.

eStreamingSetting_Reserved4 Reserved for future use.

eStreamingSetting_Reserved5 Reserved for future use.

eStreamingSetting_Reserved6 Reserved for future use.

eStreamingSetting_Reserved7 Reserved for future use.

eStreamingSetting_Reserved8 Reserved for future use.

eStreamingSetting_Reserved9 Reserved for future use.

eStreamingSetting_Reserved10 Reserved for future use.

Definition at line 2409 of file DCM.idl.

8.8.3.8 enum DCM::DeviceControl::ePID_Type

PID types.

Enumerator:

ePID_TypeEMM

ePID_TypeUnref

ePID_TypeForced

ePID_TypePrivateDataEMMG

Definition at line 2568 of file DCM.idl.

8.8.3.9 enum DCM::DeviceControl::ePIDPassingStatus

Pid passing and blocking statuses.

Enumerator:

ePID_StatusBlockedByUser Blocked through the IPS_PassBlockPids IDL call.

ePID_StatusPassed Passed ES PIDs or Transparent SI PIDs, read/write. Cannot be changed for SI.

ePID_StatusGenerated Only for SI, readonly.

ePID_StatusBlockedBySystem Blocked through inheritance (parent is blocked so block the children).

ePID_StatusNotPassed PID removed from output, cannot be changed for SI (initial value).

ePID_StatusTransparent Only for SI, to be used through the Get/SetSI_Generation call.

ePID_StatusTransparentRegeneration Only for SI, to be used through the Get/SetSI_Generation call.

ePID_StatusStopped Stop playout of an SI Pid.

ePID_StatusBlockedByDPI Blocked by DPI because no valid rule was present in custom mode.

ePID_StatusBlockedByTsRule Blocked by TS rule because [Service_AutoPassRules](#) block new service components.

ePID_StatusBlockedBySvcRule Blocked by Service rule (e.g. blockCAInfo)

Definition at line 2668 of file DCM.idl.

8.8.3.10 enum DCM::DeviceControl::ePIDPassingStatus_V2

Pid passing and blocking statuses.

Enumerator:

ePID_Status_V2_BlockedByUser Blocked through the IPS_PassBlockPids IDL call.

ePID_Status_V2_Passed Passed ES PIDs or Transparent SI PIDs, read/write. Cannot be changed for SI.

ePID_Status_V2_Generated Only for SI, readonly.

ePID_Status_V2_BlockedBySystem Blocked through inheritance (parent is blocked so block the children).

ePID_Status_V2_NotPassed PID removed from output, cannot be changed for SI (initial value).

ePID_Status_V2_Transparent Only for SI, to be used through the Get/SetSI_Generation call.

ePID_Status_V2_TransparentRegeneration Only for SI, to be used through the Get/SetSI_Generation call.

ePID_Status_V2_Stopped Stop playout of an SI Pid.

ePID_Status_V2_BlockedByDPI Blocked by DPI because no valid rule was present in custom mode.

ePID_Status_V2_BlockedByTsRule Blocked by TS rule because [Service_AutoPassRules](#) block new service components.

ePID_Status_V2_BlockedBySvcRule Blocked by Service rule (e.g. blockCAInfo)

ePID_Status_V2_AutoPassed Only for SI, read only, indicates subtable autopassing.

8.8.3.11 enum DCM::DeviceControl::ePriorityBitMode

Input Transport stream setting that defines how the priority bit in the MPEG header of the incoming packets should be manipulated.

Enumerator:

eTPB_Transparent Priority bit will be left unchanged as present on the input.
eTPB_ForceToZero Priority bit will be forced to zero;.
eTPB_ForceToOne Priority bit will be forced to one.

Definition at line 4333 of file DCM.idl.

8.8.3.12 enum DCM::DeviceControl::eRoutingStatusResult

Result of routing file upload operation (pre-config - IPS_ProcessRoutingFile)

Enumerator:

eRoutingResultSuccess No warnings or errors.
eRoutingStatusSuccessWithWarnings Warnings occurred.
eRoutingStatusSuccessWithErrors Errors occurred.
eRoutingStatusFatalError File could not be processed.

Definition at line 2782 of file DCM.idl.

8.8.3.13 enum DCM::DeviceControl::eRoutingStatusSeverity

Severity of error that occurred during routing file upload (pre-config - IPS_ProcessRoutingFile)

Enumerator:

eRoutingStatusWarning Warning (could be executed)
eRoutingStatusError Error (line could not be executed)
eRoutingStatusFatal File could not be processed.

Definition at line 2791 of file DCM.idl.

8.8.3.14 enum DCM::DeviceControl::eTimeBaseSelectionMode

Deprecated Use V2 structure instead

Enumerator:

eTBS_Auto VBR mode, Firmware freely chooses a PCR PID and is allowed to switch.
eTBS_AutoReferredPCR VBR mode, Software selects a PMT referenced PCR PID and locks it.
eTBS_ForcedPCR VBR mode User requests to use and lock the PCR PID referenced in the given Service Id.
eTBS_CBR_Auto CBR mode, firmware chooses a PCR PID and is allowed to switch.
eTBS_CBR_AutoReferredPCR CBR mode, Software selects a PMT referenced PCR PID and locks it.
eTBS_CBR_ForcedPCR CBR mode, User requests to use and lock the PCR PID referenced in the given Service Id.

Definition at line 2934 of file DCM.idl.

8.8.3.15 enum DCM::DeviceControl::eTimeBaseSelectionMode_V2

Enumerator:

eTBS_V2_Auto VBR mode, Firmware freely chooses a PCR PID and is allowed to switch.
eTBS_V2_AutoReferredPCR VBR mode, Software selects a PMT referenced PCR PID and locks it.
eTBS_V2_ForcedPCR VBR mode User requests to use and lock the PCR PID referenced in the given Service Id.
eTBS_V2_CBR_Auto CBR mode, firmware chooses a PCR PID and is allowed to switch.
eTBS_V2_CBR_AutoReferredPCR CBR mode, Software selects a PMT referenced PCR PID and locks it.

8.8.4 Function Documentation

8.8.4.1 void DCM::DeviceControl::BoardDejitterCfgGet (in unsigned short *BoardNumber*, out BoardDejitterCfg_t *CfgOut*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the board default VBR and CBR latency.

Currently the VBR latency will always be 110ms.

Parameters

in	<i>BoardNumber</i>	The BoardNumber of which parameters need to be changed.
in	<i>CfgOut</i>	The new default setting

Exceptions

<i>OpNotSupported</i>	This call is not supported in the running software version.
<i>OpNotSucceeded</i>	In case of BoardNumber does not identify a Gbe board

Version

Release 6.5

8.8.4.2 void DCM::DeviceControl::BoardDejitterCfgSet (in unsigned short *BoardNumber*, in BoardDejitterCfg_t *CfgIn*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the board default VBR and CBR latency.

Currently the VBR latency should always be 110ms. Changing the board default applies to all existing input TS's.

Parameters

in	<i>BoardNumber</i>	The BoardNumber of which parameters need to be changed.
in	<i>CfgIn</i>	The new default setting

Exceptions

<i>OpNotSupported</i>	This call is not supported in the running software version.
<i>OpNotSucceeded</i>	In case of - BoardNumber does not identify a Gbe board - The requested latency is out of range.

Version

Release 6.5

8.8.4.3 `Debug_Gbe_InputTS_List_t DCM::DeviceControl::DebugGbeStreamInGetL ( in IPS_Ref_t PhysRef, in Ref_List_t RefList )` raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get a list of Gbe information of incoming transport streams.

Call mainly meant for troubleshooting information. For each input transport stream, the "hardware index" is also returned now.

Parameters

in	<i>PhysRef</i>	The BoardNr and PortNr of which you want the information.
in	<i>RefList</i>	A Ref_List_t, sequence of Ref's (longs) you want info about.

Returns

A sequence of [Debug_Gbe_InputTS_t](#) entries.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case invalid references(PhysRef, RefList) are used.

Note

- A value of 0xFFFF for port means all ports.
- An empty RefList means all refs.

Version

Release 8.5

8.8.4.4 `Debug_Gbe_OutputTS_List_t DCM::DeviceControl::DebugGbeStreamOutGetL ( in IPS_Ref_t PhysRef, in Ref_List_t RefList )` raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get a list of Gbe information of outgoing transport streams.

Call mainly meant for troubleshooting information. For each input transport stream, the "hardware index" is also returned.

Parameters

in	<i>PhysRef</i>	The BoardNr and PortNr of which you want the information.
in	<i>RefList</i>	A Ref_List_t, sequence of Ref's (longs) you want info about.

Returns

A sequence of `ebug_Gbe_OutputTS_t` entries.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case invalid references(PhysRef, RefList) are used.

Note

- A value of 0xFFFF for port means all ports.
- An empty RefList means all refs.

Version

Release 8.5

8.8.4.5 void DCM::DeviceControl::GbeIO_OutStreamIP_ChangeL (in IPS_Ref_t *RefPhys*, in GbeIO_IP_Settings_List_t *OutputGbeIO_StreamList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

Change the IPv4 or IPv6 header parameters of one or more existing outgoing Gbe IO streams.

Parameters

in	<i>RefPhys</i>	The BoardNr and PortNr of which parameters need to be changed.
in	<i>OutputGbeIO_StreamList</i>	List of GbeIO_IP_Header_t entries.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case of • Invalid references (RefPhys). • Inconsistency between RefPhys.BoardNr & OutputTSList[x].Ref.BoardNr. • Inconsistency between RefPhys.PortNr & OutputTSList[x].Ref.PortNr in case RefPhys.PortNr != 0xFFFF. • Out of range values (UDPPort).

Version

Release 8.2

8.8.4.6 GbeIO_IP_Settings_List_t DCM::DeviceControl::GbeIO_OutStreamIP_GetL (in IPS_Ref_t *RefPhys*, in Ref_List_t *RefList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the IPv4 or IPv6 parameters for a list of outgoing transport streams.

Parameters

in	<i>RefPhys</i>	The BoardNr and PortNr you want information about.
in	<i>RefList</i>	A sequence of Ref's you want info about.

Returns

OutputGbeIO_StreamList List of GbeIO_IP_Header_t entries.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case invalid references (RefPhys, RefList) are used.

Note

- A value of 0xFFFF for port means all ports.
- An empty list means all refs.

Version

Release 8.2

8.8.4.7 void DCM::DeviceControl::GetDefault_InsertCATDescriptors (in unsigned short *BoardNumber*, out eInsertCATDescriptors *InsertCATDescriptors*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Get default Insert CAT Descriptors mode setting Defaults are attached to a board.

Parameters

in	<i>BoardNumber</i>	The BoardNumber you want information about.
out	<i>InsertCAT-Descriptors</i>	The current default.

Exceptions

<i>OpNotSupported</i>	in case • BoardNr = 0 = Main board • DCM version < 9.10 • called for board which doesn't have physical output (e.g. transcoder board)
<i>OperationFailed</i>	In case • BoardNumber does not exist
<i>OpNotSucceeded</i>	Unspecified error

Version

Release 9.10

8.8.4.8 void DCM::DeviceControl::GetDefault_NitInPat (in unsigned short *BoardNumber*, out eNitInPat *NitInPat*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get default Nit in Pat mode setting Defaults are attached to a board.

Parameters

in	<i>BoardNumber</i>	The BoardNumber you want information about.
out	<i>NitInPat</i>	The current default.

Exceptions

<i>OpNotSupported</i>	This call is not supported in the running software version.
<i>OpNotSucceeded</i>	In case of BoardNumber does not exist

8.8.4.9 void DCM::DeviceControl::GetDefault_SourceUdp (in unsigned short *Board*, out unsigned short *SourceUdp*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the current default source UDP port number for a new TS.

Parameters

in	<i>Board</i>	An unsigned short to indicate the slot.
out	<i>SourceUdp</i>	The default source UDP port number.

Exceptions

<i>OpNotSupported</i>	When called for other boards than GbE ones (Main, asi, ..).
<i>OpNotSucceeded</i>	in case of Invalid reference Board

8.8.4.10 void DCM::DeviceControl::GetDefaultAutoPassRules (in unsigned short *BoardNr*, out DefaultAutoPassRules *rules*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the board default auto pass rules for service component passing.

These are the current settings.

Parameters

in	<i>BoardNr</i>	The slot the settings refer to.
in	<i>rules</i>	The current DefaultAutoPassRules .

8.8.4.11 void DCM::DeviceControl::GetDefaultForbiddenPidRanges (in unsigned short *SlotNumber*, out ForbiddenPidRange_List_t *RangeList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the default forbidden pid ranges.

Parameters

in	<i>SlotNumber</i>	Slot number
out	<i>RangeList</i>	The list of forbidden pid ranges

Exceptions

<i>OpNotSupported</i>	When SlotNumber = 0 = Main board.
<i>OpNotSucceeded</i>	In case of

Version

Release 8.0

8.8.4.12 void DCM::DeviceControl::GetDefaultPriorityBit (in unsigned short *SlotNbr*, out ePriorityBitMode *PriorityBitSetting*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get current default PrioBitSetting.

Parameters

in	<i>SlotNbr</i>	BoardNr of which we want the information.
out	<i>PriorityBit-Setting</i>	the default Priority Bit Setting.

Exceptions

<i>OpNotSupported</i>	When called for other than IO boards (Main).
-----------------------	--

Version

Release 7.5

8.8.4.13 void DCM::DeviceControl::GetDefaultTBSSMode_V2 (in unsigned short *BoardNumber*, out eTimeBaseSelectionMode_V2 *TBS_Mode*, out boolean *FastLock*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get default [Time](#) Base Selection Mode that is used for newly created input TSs.

Parameters

in	<i>BoardNumber</i>	The BoardNumber of which parameters need to be queried.
out	<i>TBS_Mode</i>	The current default.
out	<i>FastLock</i>	Indicates board wide fast lock option, will always be false for the moment.

Exceptions

<i>OpNotSupported</i>	This call is not supported in the running software version.
<i>OperationFailed</i>	in case BoardNumber does not identify a Gbe board
<i>OpNotSucceeded</i>	: Unspecified error

Version

Supported since release 10.30

8.8.4.14 void DCM::DeviceControl::GetDefaultTimeBaseSelectionMode (in unsigned short *BoardNumber*, out eTimeBaseSelectionMode *TBS_Mode*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get default **Time** Base Selection Mode that is used for newly created input TSs.

Parameters

in	<i>BoardNumber</i>	The BoardNumber of which parameters need to be queried.
out	<i>TBS_Mode</i>	The current default.

Exceptions

<i>OpNotSupported</i>	This call is not supported in the running software version.
<i>OpNotSucceeded</i>	In case of BoardNumber does not identify a Gbe board

Deprecated Since version 10.30, use GetDefaultTBSMode_V2 instead

8.8.4.15 void DCM::DeviceControl::GetForbiddenPidRanges (in IPS_RefTS_t *RefTS*, out ForbiddenPidRange_List_t *RangeList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the forbidden pid ranges for a specific output transport stream.

Parameters

in	<i>RefTS</i>	The referenceto the output transport stream
out	<i>RangeList</i>	The list of forbidden pid ranges

Exceptions

<i>OpNotSupported</i>	When SlotNumber = 0 = Main board.
<i>OpNotSucceeded</i>	In case of output TS cannot be found

Version

Release 8.0

8.8.4.16 void DCM::DeviceControl::GetPassMotorolaTables (in unsigned short *BoardNumber*, out boolean *Pass*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get current Pass Motorola C0/C1 table setting.

Parameters

in	<i>BoardNumber</i>	The board number of which we want the information.
out	<i>Pass</i>	The current setting.

Exceptions

<i>OpNotSupported</i>	When called for other than IO boards (Main).
-----------------------	--

Version

Release 7.5

8.8.4.17 void DCM::DeviceControl::GetSI_DefaultGenerationModes (in IPS_Ref_t *RefPhys*, out SI_Table_GenerationMode_List_t *Modes*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)

This gets the default generation mode of all supported SI tables for one or more TS.

Parameters

in	<i>RefPhys</i>	The slot (board) and port to apply the call on. (Port mux be 0xFFFF, because boardsetting)
out	<i>Modes</i>	list with generation modes for tables (only supported for TDT and TOT)

Exceptions

<i>OpNotSupported</i>	RefPhys invalid
-----------------------	-----------------

8.8.4.18 void DCM::DeviceControl::GetSI_DefaultPayoutPeriods (in IPS_Ref_t *RefPhys*, out SI_Table_Period_List_t *Periods*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

this gets the current defaults for all supported SI tables

Parameters

in	<i>RefPhys</i>	The slot(board) and port to apply the call on. Port must be 0xFFFF (boardsetting)
out	<i>Periods</i>	

Returns

Periods List of all SI tables for all standards + periods

Exceptions

<i>OpNotSupported</i>	When called for other than IO boards (Main).
<i>OpNotSucceeded</i>	when RefPhys is invalid

8.8.4.19 void DCM::DeviceControl::GetTOT_Timezones (in IPS_Ref_t *RefPhys*, in IPS_RefTS_List_t *TS_List*, out TS_TOT_Timezone_List_t *Timezones*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)

This gets the TOT descriptor timezones for one or more TS's.

Parameters

in	<i>RefPhys</i>	reference to board, port
in	<i>TS_List</i>	list of TS's
out	<i>Timezones</i>	A TS_TOT_Timezone_List_t list of TS's with corresponding timezones.

Returns

Timezones list of TS's with corresponding timezones

Exceptions

<i>OpNotSucceeded</i>	in case of invalid references (RefTS)
-----------------------	---------------------------------------

8.8.4.20 void DCM::DeviceControl::InEMM_GetL (in InEMM_RefList_t *EMM_RefList*, out EMM_DataList_t *EMM_DataList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the list of additional information of all EMM's/PD's at the output.

Call only meant for the main board.

Parameters

in	<i>EMM_RefList</i>	A sequence of InEMM_Data_t entries.
out	<i>EMM_DataList</i>	

Returns

EMM_DataList A sequence of [EMM_Data_t](#) entries.

8.8.4.21 void DCM::DeviceControl::InputTsExistenceGetL (in IPS_Ref_t *RefPhys*, in IPS_RefTS_List_t *RefTsList*, out InTsExistenceReasonsList_t *lst*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get reason of existence for some input TS.

Parameters

in	<i>RefPhys</i>	The port the Input TS are attached to.
in	<i>RefTsList</i>	List of References of InputTs for which to return the existence reason. Empty list equals all InputTs attached to RefPhys.
out	<i>lst</i>	List of RefTs/ExistenceBitmap pairs

Exceptions

<i>OpNotSupported</i>	When called for main board.
<i>OpNotSucceeded</i>	In case of • RefPhys does not exist. • RefTs does not match RefPhys

Version

Release 6.5

8.8.4.22 void DCM::DeviceControl::InTS_PriorityBits_DeLL (in IPS_Ref_t *RefPhys*, in IPS_RefTS_List_t *RefTsList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

Revert the Priority Bit setting to default for a list of input TSs.

Parameters

in	<i>RefPhys</i>	The port for which to change to settings
in	<i>RefTsList</i>	List of TSs for which to delete the settings

Exceptions

<i>OpNotSupported</i>	When called for other than IO boards (Main).
<i>OpNotSucceeded</i>	in case • Invalid input references are used • TS does not exist or is not for input
<i>LicenseError</i>	In case PRIORITY_BIT_ADAPTATION license is missing.

8.8.4.23 InTS_PriorityBit_List_t DCM::DeviceControl::InTS_PriorityBits_GetL (in IPS_Ref_t *RefPhys*, in IPS_RefTS_List_t *RefTsList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the list of transport priority bit settings for a number of incoming transport streams.

Parameters

in	<i>RefPhys</i>	The port of which you want the information.
in	<i>RefTsList</i>	A Ref_List_t, sequence of TS Ref's you want info about.

Returns

InTS_PriorityBit_List_t A sequence of ChangePrioBitInputTS_t entries.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case invalid references(RefList) are used.

- An empty ReTsfList means all TS refs.

Version

Release 7.5

8.8.4.24 void DCM::DeviceControl::InTS_PriorityBits_SetL (in IPS_Ref_t *RefPhys*, in InTS_PriorityBit_List_t *InTS_PriorityBit_List*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

Change the transport priority bit behavior for one or more existing incoming TS.

Parameters

in	<i>RefPhys</i>	The port for which parameters need to be changed.
in	<i>InTS_PriorityBit_List</i>	List of ChangePrioBitInputTS_t entries.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case of • Inconsistency between RefPhys & InputTSList[x].Ref.BoardNr. • Inconsistency between PortNr & InputTSList[x].Ref.PortNr in case RefPhys.-PortNr != 0xFFFF. • Invalid enum value (ePrioBitSetting_t).
<i>LicenseError</i>	In case PRIORITY_BIT_ADAPTATION license is missing.

Version

Release 7.5

8.8.4.25 IPS_ReferenceTS_List_t DCM::DeviceControl::IPS_FindTSs (in unsigned short *BoardNumber*, in IPS_LookupTS_List_t *LookUpTS_List*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the TS indexes for a number of transport streams.

NO automatic creation will be done in any case. This function can also be used for IP Video gateway and IP Audio Gateway boards.

Parameters

in	<i>BoardNumber</i>	An unsigned short to indicate the slot.
in	<i>LookUpTS_List</i>	A sequence of board/port/UDP port, ... for which TS Index is to be returned.

Returns

A IPS_ReferenceTS_List_t, a sequence of [IPS_ReferenceTS_t](#) entries with corresponding TSindex.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	when BoardNumber or Ref is invalid.

8.8.4.26 `IPS_Gbe_InputTS_List_t DCM::DeviceControl::IPS_Gbe_InTS_GetL ( in IPS_Ref_t PhysRef, in Ref_List_t RefList )` raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get a list of Gbe information of incoming transport streams.

Parameters

in	<i>PhysRef</i>	The BoardNr and PortNr of which you want the information.
in	<i>RefList</i>	A Ref_List_t, sequence of Ref's (longs) you want info about.

Returns

IPS_Gbe_InputTS_List_t A sequence of [IPS_Gbe_InputTS_t](#) entries.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case invalid references(<i>PhysRef</i> , <i>RefList</i>) are used.

Note

- A value of 0xFFFF for port means all ports.
- An empty RefList means all refs.

8.8.4.27 `void DCM::DeviceControl::IPS_GetDefaultStandard ( in IPS_Ref_t RefPhys, out eEsTypeStandard eIn, out eEsTypeStandard eOut )` raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get current default eEsTypeStandard for input and output.

Parameters

in	<i>RefPhys</i>	BoardNr & PortNr of which we want the information.
out	<i>eIn</i>	eEsTypeStandard value for input.
out	<i>eOut</i>	eEsTypeStandard value for output.

Note

Defaults are stored per board: the PortNumber in RefPhys is ignored.

Exceptions

<i>OpNotSupported</i>	When called for other than IO boards (Main).
-----------------------	--

8.8.4.28 void DCM::DeviceControl::IPS_InPID_GetL (in IPS_RefTS_t *RefTS*, in ePID_Type *PID_Type*, out IPS_In_PID_List_t *PID_DataList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the list of PID's on a InputTS.

Parameters

in	<i>RefTS</i>	BoardNr & PortNr for which to get the PIDs. - If RefTS.Ref==0xFFFFFFFF (i.e. wildcard), then all output TS's on the specified port are processed. - If Ref.PortNr == INVALID_PORT (i.e. wildcard) all ports are processed.
in	<i>PID_Type</i>	An ePID_Type to specify the type of the PID to get.
out	<i>PID_DataList</i>	

Returns

PID_DataList A sequence of [IPS_InPID_Data_t](#) entries.

Exceptions

<i>OpNotSucceeded</i>	In case of Invalid references are used (RefTS which cannot be found)
-----------------------	---

8.8.4.29 void DCM::DeviceControl::IPS_InPID_GetL_V2 (in IPS_RefTS_t *RefTS*, in ePID_Type *PID_Type*, out IPS_In_PID_List_V2_t *PID_DataList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the list of PID's on a InputTS (including property bits).

Parameters

in	<i>RefTS</i>	BoardNr & PortNr for which to get the PIDs. - If RefTS.Ref==0xFFFFFFFF (i.e. wildcard), then all output TS's on the specified port are processed. - If Ref.PortNr == INVALID_PORT (i.e. wildcard) all ports are processed.
in	<i>PID_Type</i>	An ePID_Type to specify the type of the PID to get.
out	<i>PID_DataList</i>	List of PIDs with property bits.

Returns

PID_DataList A sequence of [IPS_InPID_Data_V2_t](#) entries.

Exceptions

<i>OpNotSucceeded</i>	In case of Invalid references are used (RefTS which cannot be found)
-----------------------	--

Version

Release 7.5

8.8.4.30 void DCM::DeviceControl::IPS_InTS_ChangeL (in IPS_Ref_t *RefPhys*, in IPS_ChangeInputTS_List_t *InputTSList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Change the parameters of one or more existing incoming TS.

Parameters

in	<i>RefPhys</i>	The BoardNr and PortNr of which parameters need to be changed.
in	<i>InputTSList</i>	List of IPS_ChangeInputTS_List_t entries.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case of - Invalid references (RefPhys). - Inconsistency between RefPhys.BoardNr & InputTSList[x].Ref.BoardNr. - Inconsistency between RefPhys.PortNr & InputTSList[x].Ref.PortNr in case RefPhys.PortNr != 0xFFFF. - Invalid enum value (eEsTypeStandard).

8.8.4.31 IPS_InputTS_List_t DCM::DeviceControl::IPS_InTS_GetL (in IPS_Ref_t *PhysRef*, in Ref_List_t *RefList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get a list of incoming transport streams.

Parameters

in	<i>PhysRef</i>	The BoardNr and PortNr of which you want the information.
in	<i>RefList</i>	A Ref_List_t, sequence of Ref's (longs) you want info about.

Returns

IPS_InputTS_List_t A sequence of [IPS_InputTS_t](#) entries.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case invalid references(PhysRef, RefList) are used.

Note

- A value of 0xFFFF for port means all ports.
- An empty RefList means all refs.

8.8.4.32 `IPS_ReferenceTS_List_t DCM::DeviceControl::IPS_Lookup_TSs ( in unsigned short BoardNumber, in IPS_LookupTS_List_t LookUpTS_List )` raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed, OutOfRange)

Gets the TS indexes for a number of transport streams.

If an input TS is looked up, this one will automatically be created when not found. This function can also be used for IP Video gateway and IP Audio Gateway boards.

Parameters

in	<i>BoardNumber</i>	An unsigned short to indicate the slot.
in	<i>LookUpTS_List</i>	A sequence of board/port/UDP port, ... for which TS Index is to be returned.

Returns

A `IPS_ReferenceTS_List_t`, a sequence of [IPS_ReferenceTS_t](#) entries with corresponding TSindex.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	when BoardNumber or Ref is invalid. • When looking up an INPUT GBE TS only a multicast ip address or else 0.0.-0.0 should be used • When a unicast IP address other than 0.0.0.0 is given to lookup an input TS, this is internally converted to 0.0.0.0 • 0.0.0.0 is used to identify the current unicast address of the GBE port

8.8.4.33 `void DCM::DeviceControl::IPS_OutDefaultsGet ( in IPS_Ref_t RefPhys, out IPS_UDP_Socket_t Socket, out long IBitrate, out eIPS_IncrScheme Incr )` raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get current set of defaults for a new TS.

Parameters

in	<i>RefPhys</i>	BoardNr & PortNr of which we want the information.
out	<i>Socket</i>	Default ip address & UDP port.
out	<i>IBitrate</i>	Default bitrate value.
out	<i>Incr</i>	Default incremental scheme.

Note

Output defaults are stored per board: the PortNumber in RefPhys is ignored.

Exceptions

<i>OpNotSupported</i>	When called for other boards than GbE ones (Main, ASI,...).
-----------------------	---

8.8.4.34 void DCM::DeviceControl::IPS_OutDefaultsSet (in IPS_Ref_t *RefPhys*, in IPS_UDP_Socket_t *Socket*, in long *IBitrate*, in eIPS_IncrScheme *Incr*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set defaults for new TS created with [IPS_OutTS_AddL\(\)](#).

Parameters

in	<i>RefPhys</i>	Specifies the BoardNr & PortNr on which to apply these defaults.
in	<i>Socket</i>	Default ip address & UDP port.
in	<i>IBitrate</i>	Default bitrate values: range 0.1 Mbps..200Mbps
in	<i>Incr</i>	Default incremental scheme.

Exceptions

<i>OpNotSupported</i>	When called for other boards than GbE ones (Main, ASI,...).
<i>OpNotSucceeded</i>	In case of • Out of range values (Ip address, UDP port, Bitrate). • Invalid enum values.

Note

If a new TS is created, the software will check if the default (IP address, UDP port) already exist. If not, a new TS is created with default IP address and UDP port. If the IP address, UDP port already exist, the incremental scheme is used to find an IP address, UDP port combination that is free. Output defaults are stored per board: PortNumber in RefPhys is ignored. IP address and UDP port combination is not unique over different I/O boards.

8.8.4.35 void DCM::DeviceControl::IPS_OutEMM_AddL (in IPS_RefTS_t *RefTS_Out*, in InEMM_RefList_t *PID_DataList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Routes a number of EMM pids to an output TS.

Parameters

in	<i>RefTS_Out</i>	BoardNr & PortNr & TSRef to which EMMs should be routed.
in	<i>PID_DataList</i>	A sequence of InEMM_Data_t entries.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case of • Invalid reference is used (RefTS_Out)

8.8.4.36 void DCM::DeviceControl::IPS_OutEMM_DelL (in IPS_RefTS_t *RefTS_Out*, in InEMM_RefList_t *PID_DataList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Removes the routing for a number of EMM pids to an output TS.

Parameters

in	<i>RefTS_Out</i>	BoardNr & PortNr & TSRef for which EMMs should no longer be routed.
in	<i>PID_DataList</i>	A sequence of InEMM_Data_t entries.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case of Invalid reference is used (RefTS_Out)

8.8.4.37 void DCM::DeviceControl::IPS_OutPID_AddL (in IPS_Ref_t *RefPhys*, in IPS_OutPID_DataList_t *PID_DataList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Passes a list of (unreferenced) PID's to an OutputTS.

Parameters

in	<i>RefPhys</i>	BoardNr & PortNr on which to apply these PIDs.
in	<i>PID_DataList</i>	A sequence of IPS_OutPID_Data_t entries with the PIDs to add.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case of - Invalid references (RefPhys, PID_DataList). - Inconsistency between RefPhys.BoardNr & PID_DataList[x].Ref.BoardNr. - Inconsistency between RefPhys.PortNr & PID_DataList[x].Ref.PortNr in case RefPhys.PortNr != 0xFFFF.

8.8.4.38 void DCM::DeviceControl::IPS_OutPID_DeleteL (in IPS_Ref_t *RefPhys*, in IPS_OutPID_DataList_t *PID_DataList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Deletes the list of PID's on a OutputTS.

Parameters

in	<i>RefPhys</i>	BoardNr & PortNr on which to delete these PIDs.
in	<i>PID_DataList</i>	A sequence of IPS_OutPID_Data_t entries with the PIDs to delete.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case of - Invalid references (RefPhys, PID_DataList). - Inconsistency between RefPhys.BoardNr & PID_DataList[x].Ref.BoardNr. - Inconsistency between RefPhys.PortNr & PID_DataList[x].Ref.PortNr in case RefPhys.PortNr != 0xFFFF.

8.8.4.39 void DCM::DeviceControl::IPS_OutPID_GetL (in IPS_RefTS_t *RefTS*, in ePID_Type *PID_Type*, out IPS_OutPID_Data2List_t *PID_DataList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the list of PID's on a OutputTS.

Parameters

in	<i>RefTS</i>	BoardNr & PortNr for which to get the PIDs. If RefTS.Ref==0xFFFFFFF, then all output TS's are processed.
in	<i>PID_Type</i>	An ePID_Type to specify the type of the PID to get.
out	<i>PID_DataList</i>	

Returns

PID_DataList A sequence of [IPS_OutPID_Data2_t](#) entries.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case of Invalid references are used (RefTS)

8.8.4.40 void DCM::DeviceControl::IPS_OutTS_AddL (in IPS_Ref_t *RefPhys*, in unsigned long *NbrOutTS*, out IPS_OutputTS_List_t *OutputTSList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Create a number of TS on given Slot and Port based on the defined defaults ([IPS_OutDefaultsSet\(\)](#), [IPS_OutDefaultsGet\(\)](#)).

Parameters

in	<i>RefPhys</i>	The BoardNr and PortNr on which TSs need to be added.
in	<i>NbrOutTS</i>	The number of TS's to create.
out	<i>OutputTSList</i>	Parameters of the new TS's.

Exceptions

<i>OpNotSupported</i>	When called for other boards than GbE ones (Main, asi, ..).
<i>OpNotSucceeded</i>	In case of • Invalid references (RefPhys). • Maximum number of supported TSs/board is reached. • Maximum number of supported TSs/GBE port is reached.

8.8.4.41 void DCM::DeviceControl::IPS_OutTS_AddL_V2 (in IPS_Ref_t *RefPhys*, in unsigned long *NbrOutTS*, out IPS_OutputTS_List_V2_t *OutputTSList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Create a number of TS on given Slot and Port based on the defined defaults ([IPS_OutDefaultsSet\(\)](#), [IPS_OutDefaultsGet\(\)](#)).

Parameters

in	<i>RefPhys</i>	The BoardNr and PortNr on which TSs need to be added.
in	<i>NbrOutTS</i>	The number of TS's to create.
out	<i>OutputTSList</i>	Parameters of the new TS's.

Exceptions

<i>OpNotSupported</i>	When called for other boards than GbE ones (Main, asi, ..).
<i>OpNotSucceeded</i>	In case of • Invalid references (RefPhys). • Maximum number of supported TSs/board is reached. • Maximum number of supported TSs/GBE port is reached.

Version

Release 8.5

8.8.4.42 void DCM::DeviceControl::IPS_OutTS_ChangeL (in IPS_Ref_t *RefPhys*, in IPS_OutputTS_List_t *OutputTSList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

Change the parameters of one or more existing outgoing TS.

Parameters

in	<i>RefPhys</i>	The BoardNr and PortNr of which parameters need to be changed.
in	<i>OutputTSList</i>	List of IPS_OutputTS_t entries.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case of • Invalid references (RefPhys). • Inconsistency between RefPhys.BoardNr & OutputTSList[x].Ref.BoardNr. • Inconsistency between RefPhys.PortNr & OutputTSList[x].Ref.PortNr in case RefPhys.PortNr != 0xFFFF. • Out of range values (Bitrate, UDPPort, TSID, ONID). • Invalid enum value (State, eEsTypeStandard).

Note

The maximum bitrate allowed on an ASI I/O board depends on the output mode of the ASI port.

8.8.4.43 void DCM::DeviceControl::IPS_OutTS_ChangeL_V2 (in IPS_Ref_t *RefPhys*, in IPS_OutputTS_List_V2_t *OutputTSList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

Change the parameters of one or more existing outgoing TS.

Parameters

in	<i>RefPhys</i>	The BoardNr and PortNr of which parameters need to be changed.
in	<i>OutputTSList</i>	List of IPS_OutputTS_V2_t entries.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case of • Invalid references (RefPhys). • Inconsistency between RefPhys.BoardNr & OutputTSList[x].Ref.BoardNr. • Inconsistency between RefPhys.PortNr & OutputTSList[x].Ref.PortNr in case RefPhys.PortNr != 0xFFFF. • Out of range values (Bitrate, UDPPort, TSID, ONID). • Invalid enum value (State, eEsTypeStandard).

Note

The maximum bitrate allowed on an ASI I/O board depends on the output mode of the ASI port.

Version

Release 8.5

8.8.4.44 void DCM::DeviceControl::IPS_OutTS_DeleteL (in IPS_Ref_t *RefPhys*, in IPS_RefTS_List_t *RefList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Delete a list of TSs.

Parameters

in	<i>RefPhys</i>	BoardNr & PortNr where TSs need to be deleted.
in	<i>RefList</i>	list of IPS_RefTS_t , references to the TSs that need to be deleted.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case - Invalid references are used (RefPhys, RefList). - Inconsistency between RefPhys.BoardNr & RefList[x].BoardNr. - Inconsistency between RefPhys.PortNr & RefList[x].PortNr in case RefPhys.PortNr != 0xFFFF.

Note

- Services are also deleted when output TS gets deleted.
- The IPS_OutTS_Delete version of this method is no longer supported.
- When called on an ASI board, a new TS is created for the ports where the TS is deleted

8.8.4.45 [IPS_OutputTS_List_t](#) DCM::DeviceControl::IPS_OutTS_GetFilteredL (in [IPS_Ref_t](#) *RefPhys*, in [Ref_List_t](#) *RefList*, in boolean *ScrambledOnly*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get a filtered list of outgoing transport streams and their parameters.

Parameters

in	<i>RefPhys</i>	The BoardNr and PortNr you want information about.
in	<i>RefList</i>	A sequence of Ref's you want info about.
in	<i>ScrambledOnly</i>	Return only TS's where scrambling of services can be done

Returns

An [IPS_OutputTS_List_t](#) list, a sequence of [IPS_OutputTS_t](#) entries.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case invalid references (RefPhys, RefList) are used.

Note

- A value of 0xFFFF for port means all ports.
- An empty list means all refs.

8.8.4.46 `IPS_OutputTS_List_V2_t DCM::DeviceControl::IPS_OutTS_GetFilteredL_V2 ( in IPS_Ref_t RefPhys, in Ref_List_t RefList, in boolean ScrambledOnly )` raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get a filtered list of outgoing transport streams and their parameters.

Parameters

in	<i>RefPhys</i>	The BoardNr and PortNr you want information about.
in	<i>RefList</i>	A sequence of Ref's you want info about.
in	<i>ScrambledOnly</i>	Return only TS's where scrambling of services can be done

Returns

An `IPS_OutputTS_List_V2_t` list, a sequence of [IPS_OutputTS_V2_t](#) entries.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case invalid references (RefPhys, RefList) are used.

Note

- A value of 0xFFFF for port means all ports.
- An empty list means all refs.

Version

Release 8.5

8.8.4.47 `IPS_OutputTS_List_V2_t DCM::DeviceControl::IPS_OutTS_GetFilteredL_V3 ( in IPS_Ref_t RefPhys, in Ref_List_t RefList, in boolean ScrambledOnly, in OperatingMode_List_t OperatingModes )` raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Get a filtered list of outgoing transport streams and their parameters.

Parameters

in	<i>RefPhys</i>	The BoardNr and PortNr you want information about.
in	<i>RefList</i>	A sequence of Ref's you want info about.
in	<i>ScrambledOnly</i>	Return only TS's where scrambling of services can be done
in	<i>Operating-Modes</i>	Return only TS's with provided operating mode

Returns

An `IPS_OutputTS_List_V2_t` list, a sequence of `IPS_OutputTS_V2_t` entries.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case invalid references (RefPhys, RefList) are used.
<i>OpNotSupported</i>	In case invalid enumeration value is used

Note

- A value of 0xFFFF for port means all ports.
- An empty list means all refs.
- An empty OperatingModes list means all operating modes

Version

Release 8.9

8.8.4.48 `IPS_OutputTS_List_t DCM::DeviceControl::IPS_OutTS_GetL ( in IPS_Ref_t RefPhys, in Ref_List_t RefList )` raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get a list of outgoing transport streams and their parameters.

Parameters

in	<i>RefPhys</i>	The BoardNr and PortNr you want information about.
in	<i>RefList</i>	A sequence of Ref's you want info about.

Returns

`IPS_OutputTS_List_t`, a sequence of `IPS_OutputTS_t` entries.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case invalid references (RefPhys, RefList) are used.

Note

- A value of 0xFFFF for port means all ports.
- An empty list means all refs.
- The `IPS_OutTS_Get` version of this method is no longer supported.

8.8.4.49 `IPS_OutputTS_List_V2_t DCM::DeviceControl::IPS_OutTS_GetL_V2 ( in IPS_Ref_t RefPhys, in Ref_List_t RefList )` raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get a list of outgoing transport streams and their parameters.

Parameters

in	<i>RefPhys</i>	The BoardNr and PortNr you want information about.
in	<i>RefList</i>	A sequence of Ref's you want info about.

Returns

IPS_OutputTS_List_V2_t, a sequence of [IPS_OutputTS_V2_t](#) entries.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case invalid references (RefPhys, RefList) are used.

Note

- A value of 0xFFFF for port means all ports.
- An empty list means all refs.
- The IPS_OutTS_Get version of this method is no longer supported.

Version

Release 8.5

8.8.4.50 void DCM::DeviceControl::IPS_OutTS_LT_AddL (in IPS_Ref_t *RefPhys*, in IPS_OutputTS_LT_List_t *OutputTSList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Create a number of Transparent Loop Through TSs on given Slot and Port.

Parameters

in	<i>RefPhys</i>	The BoardNr and PortNr on which TSs need to be added.
in	<i>OutputTSList</i>	Parameters of the new TS's. if IP and UDP is Invalid, boarddefault will be used.

Exceptions

<i>OpNotSupported</i>	When called for other boards than GbE or ASI ones (Main, Transcoder, ..).
<i>OpNotSucceeded</i>	In case of • Invalid references (RefPhys). • Maximum number of supported TSs/board is reached. • Maximum number of supported TSs/port is reached. • ASI SFN MKII board which is in Deterministic Remux mode

Note

On a loop through output TS only limited settings are possible: It is possible to change IP related settings on a GbE TS (Ip address, UDP port, TOS, TTL, VLAN and FEC). Other TS settings are not supported by a loop through TS and these IDL calls will then return an OpNotSucceeded exception

Version

Release 5.1

Note

From release 8.2 more strict checking is done : trying to create a second loop through on an ASI output port will now return an OpNotSucceeded instead of overwriting any older loop through transport stream.

8.8.4.51 void DCM::DeviceControl::IPS_OutTS_LT_AddL_V2 (in IPS_Ref_t *RefPhys*, in IPS_OutputTS_LT_List_V2_t *OutputTSList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Create a number of Transparent Loop Through TSs on given Slot and Port.

Parameters

in	<i>RefPhys</i>	The BoardNr and PortNr on which TSs need to be added.
in	<i>OutputTSList</i>	Parameters of the new TS's. if IP and UDP is Invalid, boarddefault will be used.

Exceptions

<i>OpNotSupported</i>	When called for other boards than GbE or ASI ones (Main, Transcoder, ..).
<i>OpNotSucceeded</i>	In case of • Invalid references (RefPhys). • Maximum number of supported TSs/board is reached. • Maximum number of supported TSs/port is reached. • ASI SFN MKII board which is in Deterministic Remux mode

Note

On a loop through output TS only limited settings are possible: It is possible to change IP related settings on a GbE TS (Ip address, UDP port, TOS, TTL, VLAN and FEC). Other TS settings are not supported by a loop through TS and these IDL calls will then return an OpNotSucceeded exception

Version

Release 8.5

8.8.4.52 void DCM::DeviceControl::IPS_OutTS_LT_ChangeL (in unsigned short *BoardNumber*, in IPS_OutputTS_LT_List_t *OutputTSList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Change the parameters of one or more existing outgoing TS.

Parameters

in	<i>BoardNumber</i>	The BoardNr which parameters need to be changed.
in	<i>OutputTSList</i>	List of IPS_OutputTS_LT_t entries.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case of • Invalid references (RefPhys). • Inconsistency between RefPhys.BoardNr & OutputTSList[x].Ref.BoardNr. • Inconsistency between RefPhys.PortNr & OutputTSList[x].Ref.PortNr in case RefPhys.PortNr != 0xFFFF. • Out of range values (UDPPort). • Invalid enum value (State).

8.8.4.53 void DCM::DeviceControl::IPS_OutTS_LT_ChangeL_V2 (in unsigned short *BoardNumber*, in IPS_OutputTS_LT_List_V2_t *OutputTSList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Change the parameters of one or more existing outgoing TS.

Parameters

in	<i>BoardNumber</i>	The BoardNr which parameters need to be changed.
in	<i>OutputTSList</i>	List of IPS_OutputTS_LT_V2_t entries.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case of • Invalid references (RefPhys). • Inconsistency between RefPhys.BoardNr & OutputTSList[x].Ref.BoardNr. • Inconsistency between RefPhys.PortNr & OutputTSList[x].Ref.PortNr in case RefPhys.PortNr != 0xFFFF. • Out of range values (UDPPort). • Invalid enum value (State).

Version

Release 8.5

8.8.4.54 IPS_OutputTS_LT_List_t DCM::DeviceControl::IPS_OutTS_LT_GetL (in IPS_Ref_t *RefPhys*, in Ref_List_t *RefList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get a list of outgoing Transparent Loop Through TSs and their parameters.

Parameters

in	<i>RefPhys</i>	The BoardNr and PortNr you want information about.
in	<i>RefList</i>	A sequence of Ref's you want info about.

Returns

IPS_OutputTS_LT_List_t, a sequence of [IPS_OutputTS_LT_t](#) entries.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case invalid references (RefPhys, RefList) are used.

Note

- A value of 0xFFFF for port means all ports.
- An empty list means all refs.

8.8.4.55 `IPS_OutputTS_LT_List_V2_t DCM::DeviceControl::IPS_OutTS_LT_GetL_V2 ( in IPS_Ref_t RefPhys, in Ref_List_t RefList )` raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get a list of outgoing Transparent Loop Through TSs and their parameters.

Parameters

in	<i>RefPhys</i>	The BoardNr and PortNr you want information about.
in	<i>RefList</i>	A sequence of Ref's you want info about.

Returns

IPS_OutputTS_LT_List_V2_t, a sequence of [IPS_OutputTS_LT_V2_t](#) entries.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case invalid references (RefPhys, RefList) are used.

Note

- A value of 0xFFFF for port means all ports.
- An empty list means all refs.

Version

Release 8.5

8.8.4.56 `void DCM::DeviceControl::IPS_ProcessRoutingFile ( in RoutingFileData_t FileData )` raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Process the upload of a routing file.

This function is used for pre-configuration of the DCM. The data that is being sent is a CSV file. An example of such a file can be retrieved from the DCM. The current configuration can also be retrieved from the DCM using the function [IPS_RetrieveRoutingFile](#). Refer to these files for the format of the CSV file.

This function will parse the configuration file and then return. The new routings will be applied after this function has already returned. Applying the setting can take a long time (up to 30 min for large files). While the settings are being applied, new calls to [IPS_ProcessRoutingFile](#) will return with an exception code `OpNotSucceeded`. To determine the progress of applying the routings, the function [IPS_RoutingFileProgress](#) can be used. Once the function [IPS_RoutingFileProgress](#) returns with `Finished` set to true, the function [IPS_RoutingFileStatus](#) can be used to obtain the result of the operation. If the uploaded file is invalid (a fatal error occurs during parsing), the function [IPS_RoutingFileProgress](#) will immediately return with `Finished` set to true.

Parameters

in	<i>FileData</i>	RoutingFileData A sequence of char corresponding to the data in the routing file.
----	-----------------	---

Exceptions

<i>OpNotSucceeded</i>	Processing of a previous IPS_ProcessRoutingFile call has not finished yet.
-----------------------	--

See also

[IPS_RoutingFileProgress](#)
[IPS_RoutingFileStatus](#)
[IPS_RetrieveRoutingFile](#)

8.8.4.57 void DCM::DeviceControl::IPS_RetrieveRoutingFile (in char *Separator*, in char *DecimalPoint*, in charSequence *EOLMarker*, out RoutingFileData_t *FileData*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Retrieve the current routing in CSV format.

The file retrieved is in the same format as is to be used for the call [IPS_ProcessRoutingFile](#).

Parameters

in	<i>Separator</i>	The character used to separate fields (usually , or ;).
in	<i>DecimalPoint</i>	The character used to represent a decimal point (usually . or ,).
in	<i>EOLMarker</i>	The character sequence used to separate lines, usually CR, LF or CR+LF.
out	<i>FileData</i>	The data in CSV format.

Exceptions

<i>OpNotSucceeded</i>	An IIOP call to an I/O board has failed.
-----------------------	--

[IPS_ProcessRoutingFile](#)

8.8.4.58 void DCM::DeviceControl::IPS_RoutingFileProgress (out boolean *Finished*, out long *CurrentValue*, out long *TotalValue*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Indicates the progress of the upload of a routing file.

Call this function repeatedly after calling [IPS_ProcessRoutingFile](#) until *Finished* is set to true. The parameter *CurrentValue* allows to display progress information in a user interface, and will increase from 0 up to *TotalValue*. The parameter *TotalValue* currently contains the number of routings to be processed, but this behavior should not be relied on.

Parameters

out	<i>Finished</i>	Has processing finished yet?
out	<i>CurrentValue</i>	Value that goes up from 0 to <i>TotalValue</i>
out	<i>TotalValue</i>	Scaling factor for the progress information

See also

[IPS_ProcessRoutingFile](#)

8.8.4.59 void DCM::DeviceControl::IPS_RoutingFileStatus (out eRoutingStatusResult *Result*, out RoutingStatusRecord_List_t *StatusRecords*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Indicates the status of the upload of a routing file.

This function will always return the information about the last call to [IPS_ProcessRoutingFile](#) that was made (or success and empty list of no such call was made). When calling this function before [IPS_RoutingFileProgress](#) returns with *Finished* set to true, a partial list of errors will be returned (all errors which have been encountered so far).

Parameters

out	<i>Result</i>	An enumeration indicating if the upload was succesful or not.
out	<i>StatusRecords</i>	A sequence of RoutingStatusRecords indicating the line number of the error, severity and a message indicating the reason of the failure.

[IPS_RoutingFileProgress](#)

[IPS_ProcessRoutingFile](#)

8.8.4.60 void DCM::DeviceControl::IPS_SetDefaultStandard (in IPS_Ref_t *RefPhys*, in eEsTypeStandard *eIn*, in eEsTypeStandard *eOut*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set defaults eEsTypeStandard for input and output for new TS.

Parameters

in	<i>RefPhys</i>	Specifies the BoardNr & PortNr on which to apply these defaults.
in	<i>eIn,eOut</i>	eEsTypeStandard values for input and output.

Exceptions

<i>OpNotSupported</i>	When called for other than IO boards (Main).
<i>OpNotSucceeded</i>	In case of - Invalid enum values. - For input the new value must be one of eDVB, eATSC, eMOTOROLA. - For output the new value must be one of eTransparent, eForceUplink, eForceVideo or eForceAudio3,.

Note

Defaults are stored per board: PortNumber in RefPhys is ignored.

8.8.4.61 void DCM::DeviceControl::OutTS_GetServiceAutoPassRules (in IPS_RefTS_t *RefOutTS*, out Service_AutoPassRules *AutoPassRules*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get current service component auto pass rules.

The service components (ES, ECM, ES_ECM) follow the input (pass/delete) or are blocked.

Parameters

in	<i>RefOutTS</i>	The output TS defined by IPS_RefTS_t .
out	<i>AutoPassRules</i>	defined by Service_AutoPassRules .

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	in case - Invalid output references are used - TS does not exist or is not for output.

8.8.4.62 void DCM::DeviceControl::OutTS_GetSI_PlayoutPeriods (in IPS_Ref_t *RefPhys*, in IPS_RefTS_List_t *TS_List*, out TS_SI_Table_Periods_List_t *Periods*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

this gets the playout periods for all supported SI tables for one or more TS

Parameters

in	<i>RefPhys</i>	The slot(board) and port to apply the call on. Port can be 0xFFFF (all ports) but can also be a specific port.
in	<i>TS_List</i>	List of all TS-es we want info upon. Empty->every TS matching Ref-Phys.
out	<i>Periods</i>	

Returns

Periods List of all SI tables for all standards + periods for the requested TS

Exceptions

<i>OpNotSupported</i>	When called for other than IO boards (Main).
<i>OpNotSucceeded</i>	RefTS: TS_List[i].PhysRef does not match RefPhys (BoardNr and/or portnr) or RefPhys is invalid
<i>OpNotSucceeded</i>	TS in TS_list non existent or invalid

8.8.4.63 void DCM::DeviceControl::OutTS_GetSubtableAutoPass (in IPS_RefTS_t *RefOutTS*, out SI_AutoPassRules_List_t *SI_AutoPassRules_List*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get current SI subtable auto pass rules.

Parameters

in	<i>RefOutTS</i>	The output TS defined by IPS_RefTS_t .
out	<i>SI_AutoPassRules_List</i>	Subtables to auto-pass and exceptions.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	in case - Invalid output references are used - TS does not exist or is not for output.

Version

Release 7.1

8.8.4.64 void DCM::DeviceControl::OutTS_GetTSAutoPassRules (in IPS_RefTS_t *RefOutTS*, out TS_AutoPassRules_List_t *AutoPassRulesList*, out TS_AutoPassRulesDisableFlags *AutoPassRulesDisableFlags*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the Auto Pass Rules for an Output TS (MPTS Pass Through).

Parameters

in	<i>RefOutTS</i>	The output TS.
out	<i>AutoPassRulesList</i>	A list of the rules that are currently used.
out	<i>AutoPassRulesDisableFlags</i>	The flags that are set by the system.

Exceptions

<i>OpNotSucceeded</i>	TS if - Invalid output references are used. - TS does not exist or is not for output.
-----------------------	--

8.8.4.65 void DCM::DeviceControl::OutTS_InsertCATDescriptors_GetL (in IPS_Ref_t *RefPhys*, in IPS_RefTS_List_t *RefTsList*, out OutTS_InsertCATDescriptors_List_t *OutTS_InsertCATDescriptors_List*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Get TS Insert CAT Descriptors mode.

Parameters

in	<i>RefPhys</i>	The port from which to retrieve settings
in	<i>RefTsList</i>	List of TSs for which to retrieve settings
in	<i>OutTS_InsertCATDescriptors_List</i>	A list of TSs with their setting

Exceptions

<i>OpNotSupported</i>	in case - BoardNr = 0 = Main board - DCM version < 9.10 - called for board which doesn't have physical output (e.g. transcoder board)
<i>OperationFailed</i>	in case - Invalid output references are used - TS does not exist or is not for output.
<i>OpNotSucceeded,:</i>	Unspecified error.

Version

Release 9.10

8.8.4.66 void DCM::DeviceControl::OutTS_InsertCATDescriptors_SetL (in IPS_Ref_t *RefPhys*, in OutTS_InsertCATDescriptors_List_t *OutTS_InsertCATDescriptors_List*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Set TS Insert CAT Descriptors mode.

Parameters

in	<i>RefPhys</i>	The port on which to configure TSs
in	<i>OutTS_InsertCATDescriptors_List</i>	A list of TSs with their setting

Exceptions

<i>OpNotSupported</i>	in case • BoardNr = 0 = Main board • DCM version < 9.10 • called for board which doesn't have physical output (e.g. transcoder board)
<i>OperationFailed</i>	in case • Invalid output references are used • TS does not exist or is not for output.
<i>OpNotSucceeded,:</i>	Unspecified error.

Version

Release 9.10

8.8.4.67 void DCM::DeviceControl::OutTS_NitInPat_GetL (in IPS_Ref_t *RefPhys*, in IPS_RefTS_List_t *RefTsList*, out OutTS_NitInPat_List_t *OutTS_NitInPat_List*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get TS NIT in PAT mode.

Parameters

in	<i>RefPhys</i>	The port from which to retrieve settings
in	<i>RefTsList</i>	List of TSs for which to retrieve settings
in	<i>OutTS_NitInPat_List</i>	A list of TSs with their setting

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board or DCM version < 4.5
<i>OpNotSucceeded</i>	in case • Invalid output references are used • TS does not exist or is not for output.

8.8.4.68 void DCM::DeviceControl::OutTS_NitInPat_SetL (in IPS_Ref_t *RefPhys*, in OutTS_NitInPat_List_t *OutTS_NitInPat_List*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set TS NIT in PAT mode.

Parameters

in	<i>RefPhys</i>	The port on which to configure TSs
in	<i>OutTS_NitInPat_List</i>	A list of TSs with their setting

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board or DCM version < 4.5
<i>OpNotSucceeded</i>	in case - Invalid output references are used - TS does not exist or is not for output.

8.8.4.69 void DCM::DeviceControl::OutTS_SetServiceAutoPassRules (in IPS_RefTS_t *RefOutTS*, in Service_AutoPassRules *AutoPassRules*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set service component auto pass rules.

The service components (ES, ECM, ES_ECM) follow the input (pass/delete) or are blocked.

Parameters

in	<i>RefOutTS</i>	The output TS defined by IPS_RefTS_t .
in	<i>AutoPassRules</i>	defined by Service_AutoPassRules .

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	in case - Invalid output references are used - TS does not exist or is not for output. - User tries to enable one of the options while the corresponding AutoPassRules.Disabled flag is set.

8.8.4.70 void DCM::DeviceControl::OutTS_SetSI_PlayoutPeriods (in IPS_Ref_t *RefPhys*, in TS_SI_Table_Periods_List_t *Periods*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)

this gets the playout periods for all supported SI tables for one or more TS

Parameters

in	<i>RefPhys</i>	The slot(board) and port to apply the call on. Port must be 0xFFFF (boardsetting)
in	<i>Periods</i>	List of all periods to set

Exceptions

<i>OpNotSupported</i>	When called for other than IO boards (Main).
<i>OpNotSucceeded</i>	RefTS: Periods[i].TS.PhysRef does not match RefPhys (BoardNr and/or portnr) or RefPhys is invalid
<i>OpNotSucceeded</i>	Periods[i].TS non existent or invalid
<i>OutOfRange</i>	Periods[i].Period above maximum or below minimum

8.8.4.71 void DCM::DeviceControl::OutTS_SetSubtableAutoPass (in IPS_RefTS_t *RefOutTS*, in SI_AutoPassRules_List_t *SI_AutoPassRules_List*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set SI subtable auto pass rules.

Parameters

in	<i>RefOutTS</i>	The output TS defined by IPS_RefTS_t .
in	<i>SI_AutoPassRules_List</i>	Subtables to auto-pass and exceptions.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	in case - Invalid output references are used - TS does not exist or is not for output.

Version

Release 7.1

8.8.4.72 void DCM::DeviceControl::OutTS_SetTSAutoPassRules (in IPS_RefTS_t *RefOutTS*, in TS_AutoPassRules_List_t *AutoPassRulesList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the Auto Pass Rules for an Output TS (MPTS Pass Through).

Specify from which Input TS all Services, EMMs and/or Unreferenced PIDs should be passed to this Output TS.

Parameters

in	<i>RefOutTS</i>	The output ts.
in	<i>AutoPassRulesList</i>	A list of the rules that should be used.

Exceptions

<i>OpNotSucceeded</i>	- Invalid output references are used. - TS does not exist or is not for output. - The TS_AutoPassRules.InputRef member does not exist or is not for input. - User tries to enable one of the options while the corresponding Disabled flag is set.
-----------------------	---

8.8.4.73 PortTsSvcProps_List_t DCM::DeviceControl::PortInTsSvcPropsGetL (in IPS_Ref_t RefPhys) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported,OperationFailed)

Get the aggregated TS and Service Properties per Input Port.

Parameters

in	RefPhys	The BoardNr and PortNr you want information about.
----	---------	--

Returns

PortTsSvcProps_List_t, sequence of aggregated properties for all TS and services per port

Exceptions

<i>OpNotSupported</i>	when BoardNr = 0 = Main board
<i>OperationFailed</i>	when given port is not an input port
<i>OperationFailed</i>	when 0xFFFF (all ports) is passed as port number
<i>OperationFailed</i>	when property collection fails

Version

Release 11.10

8.8.4.74 PortTsSvcProps_List_t DCM::DeviceControl::PortOutTsSvcPropsGetL (in IPS_Ref_t RefPhys) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported,OperationFailed)

Get the aggregated TS and Service Properties per Output Port.

Parameters

in	RefPhys	The BoardNr and PortNr you want information about.
----	---------	--

Returns

PortTsSvcProps_List_t, sequence of aggregated properties for all TS and services per port

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board
<i>OperationFailed</i>	When given port is not an output port
<i>OperationFailed</i>	when property collection fails

Note

- A value of 0xFFFF for port means all ports.

Version

Release 11.10

8.8.4.75 void DCM::DeviceControl::ReserveInputTS (in IPS_RefTS_t *TS*, in unsigned long *Reserve*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Reserves input TS If a TS is created and not used (no services or PIDs passed from that TS or TS has no input settings) and the TS is not present at the input, it will be deleted after two minutes.

With this call it is possible to prevent that the TS will be deleted if it is not present at the input

Parameters

in	<i>TS</i>	specifies BoardNr, PortNr.and TS
in	<i>Reserve</i>	Reserve flag: different from 0 if TS needs to be kept 0 (zero) if TS can be deleted if not present at the input

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
-----------------------	--------------------------------

8.8.4.76 void DCM::DeviceControl::SetDefault_InsertCATDescriptors (in unsigned short *BoardNumber*, in eInsertCATDescriptors *InsertCATDescriptors*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Set default Insert CAT Descriptors mode settings to be used for newly created output TSs Defaults are attached to a board.

The change takes effect when a new TS is created.

Parameters

in	<i>BoardNumber</i>	The BoardNumber of which parameters need to be changed.
in	<i>InsertCAT-Descriptors</i>	The new default setting.

Exceptions

<i>OpNotSupported</i>	in case - BoardNr = 0 = Main board - DCM version < 9.10 - called for board which doesn't have physical output (e.g. transcoder board)
<i>OperationFailed</i>	In case - BoardNumber does not exist - InsertCATDescriptors out of range
<i>OpNotSucceeded</i>	Unspecified error

Version

Release 9.10

8.8.4.77 void DCM::DeviceControl::SetDefault_NitInPat (in unsigned short *BoardNumber*, in eNitInPat *NitInPat*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set default Nit in PAT mode settings to be used for newly created output TSs Defaults are attached to a board.

The change takes effect when a new TS is created.

Parameters

in	<i>BoardNumber</i>	The BoardNumber of which parameters need to be changed.
in	<i>NitInPat</i>	The new default setting.

Exceptions

<i>OpNotSupported</i>	This call is not supported in the running software version.
<i>OpNotSucceeded</i>	In case of - BoardNumber does not exist - NitInPat out of range

8.8.4.78 void DCM::DeviceControl::SetDefault_SourceUdp (in unsigned short *Board*, in unsigned short *SourceUdp*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the default source UDP port number for a new TS.

Parameters

in	<i>Board</i>	An unsigned short to indicate the slot.
in	<i>SourceUdp</i>	The default source UDP port number.

Exceptions

<i>OpNotSupported</i>	When called for other boards than GbE ones (Main, asi, ..).
<i>OpNotSucceeded</i>	in case of Invalid reference Board

8.8.4.79 void DCM::DeviceControl::SetDefaultAutoPassRules (in unsigned short *BoardNr*, in DefaultAutoPassRules *rules*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the board default auto pass rules for service component passing.

These settings are copied to any newly created output TS.

Parameters

in	<i>BoardNr</i>	The slot the settings refer to.
in	<i>rules</i>	The new DefaultAutoPassRules .

8.8.4.80 void DCM::DeviceControl::SetDefaultForbiddenPidRanges (in unsigned short *SlotNumber*, in ForbiddenPidRange_List_t *RangeList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Sets a number of default Forbidden Output PID ranges (PIDs that may not be used at the Output).

The maximum number of total ranges is set to 5, each range should be distinct from another. The maximum width of the range is defined as 1000. Each time a new output transport stream is created, it will take over the default forbidden pid ranges. Any old ranges already present will be replaced with the newly provided list.

Parameters

in	<i>SlotNumber</i>	Slot number
in	<i>RangeList</i>	The list of forbidden pid ranges to be added or removed

Exceptions

<i>OpNotSupported</i>	When SlotNumber = 0 = Main board.
<i>OpNotSucceeded</i>	In case of too many ranges added, ranges overlap, range too wide •

Version

Release 8.0

8.8.4.81 void DCM::DeviceControl::SetDefaultPriorityBit (in unsigned short *SlotNbr*, in ePriorityBitMode *PriorityBitSetting*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

Set default priority setting for new input TS.

Parameters

in	<i>SlotNbr</i>	Specifies the BoardNr on which to apply these defaults.
in	<i>PriorityBit-Setting</i>	ePrioBitSetting_t values for new input TSs.

Exceptions

<i>OpNotSupported</i>	When called for other than IO boards (Main).
<i>OpNotSucceeded</i>	In case of • Invalid enum values. • For board wide setting the new value must be one of eTransparent, eForceToOne or eForceToZero.
<i>LicenseError</i>	In case PRIORITY_BIT_ADAPTATION license is missing.

Version

Release 7.5

8.8.4.82 void DCM::DeviceControl::SetDefaultTBSMode_V2 (in unsigned short *BoardNumber*, in eTimeBaseSelectionMode_V2 *TBS_Mode*, in boolean *FastLock*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set default [Time](#) Base Selection Mode to be used for newly created input TSs.

Defaults are set at the board level. eTBS_ForcedPCR and eTBS_CBR_ForcedPCR are not an option here, since this requires a Service Id as well. The board level default takes effect when a new input TS is created.

Parameters

in	<i>BoardNumber</i>	The BoardNumber of which parameters need to be changed.
in	<i>TBS_Mode</i>	The new default setting
in	<i>FastLock</i>	Should always be set to false.

Exceptions

<i>OpNotSupported</i>	This call is not supported in the running software version.
<i>OperationFailed</i>	in case - BoardNumber does not identify a Gbe board - The requested default mode is eTBS_ForcedPCR or is out of range.
<i>OpNotSucceeded</i>	: Unspecified error

Version

Supported since release 10.30

8.8.4.83 void DCM::DeviceControl::SetDefaultTimeBaseSelectionMode (in unsigned short *BoardNumber*, in eTimeBaseSelectionMode *TBS_Mode*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set default [Time](#) Base Selection Mode to be used for newly created input TSs.

Defaults are set at the board level. eTBS_ForcedPCR and eTBS_CBR_ForcedPCR are not an option here, since this requires a Service Id as well. The board level default takes effect when a new input TS is created.

Parameters

in	<i>BoardNumber</i>	The BoardNumber of which parameters need to be changed.
in	<i>TBS_Mode</i>	The new default setting

Exceptions

<i>OpNotSupported</i>	This call is not supported in the running software version.
<i>OpNotSucceeded</i>	In case of - BoardNumber does not identify a Gbe board - The requested default mode is eTBS_ForcedPCR or is out of range.

Deprecated Since version 10.30, use SetDefaultTBSMode_V2 instead

8.8.4.84 void DCM::DeviceControl::SetForbiddenPidRanges (in IPS_RefTS_t *RefTS*, in ForbiddenPidRange_List_t *RangeList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Sets a number of Forbidden Output PID ranges (PIDs that may not be used at the Output).

to a specific output transport stream. The maximum number of total ranges is set to 5, each range should be distinct from another. The maximum width of the range is defined as 1000. Any old ranges already present will be replaced with the newly provided list.

Parameters

in	<i>RefTS</i>	A BoardNr, PortNr and Ref specifying the output transport stream.
in	<i>RangeList</i>	The list of forbidden pid ranges to be added or removed

Exceptions

<i>OpNotSupported</i>	When SlotNumber = 0 = Main board.
<i>OpNotSucceeded</i>	In case of too many ranges added, ranges overlap, range too wide, output TS cannot be found •

Version

Release 8.0

8.8.4.85 void DCM::DeviceControl::SetPassMotorolaTables (in unsigned short *BoardNumber*, in boolean *Pass*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the Pass Motorola C0/C1 table setting.

Parameters

in	<i>BoardNumber</i>	The board number of which we want the information.
in	<i>Pass</i>	The new setting to apply.

Exceptions

<i>OpNotSupported</i>	When called for other than IO boards (Main).
-----------------------	--

Version

Release 7.5

8.8.4.86 void DCM::DeviceControl::SetSI_DefaultGenerationModes (in IPS_Ref_t *RefPhys*, in SI_Table_GenerationMode_List_t *Modes*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)

This sets the default generation mode of all supported SI tables for one or more TS.

Parameters

in	<i>RefPhys</i>	The slot (board) and port to apply the call on. (Port mux be 0xFFFF, because boardsetting)
in	<i>Modes</i>	list with generation modes for tables (only supported for TDT and TOT)

Exceptions

<i>OpNotSupported</i>	RefPhys invalid
-----------------------	-----------------

8.8.4.87 void DCM::DeviceControl::SetSI_DefaultPayoutPeriods (in IPS_Ref_t *RefPhys*, in SI_Table_Period_List_t *Periods*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)

this sets the defaults for any subset of the supported SI tables (or for all)

Parameters

in	<i>RefPhys</i>	The slot(board) and port to apply the call on. Port must be 0xFFFF (boardsetting)
in	<i>Periods</i>	list of SI_Payout_List_t

Exceptions

<i>OpNotSupported</i>	When called for other than IO boards (Main).
<i>OpNotSucceeded</i>	Periods[i].Ref invalid or RefPhys invalid
<i>OutOfRange</i>	Periods[i].Period above maximum or below minimum

8.8.4.88 void DCM::DeviceControl::SetTOT_Timezones (in IPS_Ref_t *RefPhys*, in TS_TOT_Timezone_List_t *Timezones*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)

This sets the TOT descriptor timezones for one or more TS's.

Parameters

in	<i>RefPhys</i>	reference to board, port
in	<i>Timezones</i>	list of TS's with corresponding timezones

Exceptions

<i>OpNotSucceeded</i>	in case of invalid references (RefTS)
-----------------------	---------------------------------------

8.8.4.89 void DCM::DeviceControl::TimeBaseSelectionMode_DelL (in IPS_Ref_t *RefPhys*, in IPS_RefTS_List_t *RefTsList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Revert the [Time](#) Base Selection Mode to default for a list of input TSs.

Parameters

in	<i>RefPhys</i>	The port for which to change to settings
in	<i>RefTsList</i>	List of TSs for which to delete the settings

Exceptions

<i>OpNotSupported</i>	When BoardNr does not identify a Gbe board
<i>OpNotSucceeded</i>	in case - Invalid input references are used - Inconsistency between RefPhys.PortNr and RefTsList[x].Ref.PortNr in case RefPhys.PortNr != 0xFFFF. - TS does not exist or is not for input

8.8.4.90 void DCM::DeviceControl::TimeBaseSelectionMode_GetL (in IPS_Ref_t *RefPhys*, in IPS_RefTS_List_t *RefTsList*, out InTS_TimeBaseSelectionMode_List_t *TBS_List*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the [Time](#) Base Selection Mode for a list of input TSs.

Parameters

in	<i>RefPhys</i>	The port from which to retrieve settings
in	<i>RefTsList</i>	List of TSs for which to retrieve settings
out	<i>TBS_List</i>	A list of Input TSs with their setting

Exceptions

<i>OpNotSupported</i>	When BoardNr does not identify a Gbe board
<i>OpNotSucceeded</i>	in case - Invalid input references are used - Inconsistency between RefPhys.PortNr and RefTsList[x].Ref.PortNr in case RefPhys.PortNr != 0xFFFF. - TS does not exist or is not for input

Deprecated Since version 10.30, use TimeBaseSelectionMode_V2_GetL instead

8.8.4.91 void DCM::DeviceControl::TimeBaseSelectionMode_SetL (in IPS_Ref_t *RefPhys*, in InTS_TimeBaseSelectionMode_List_t *TBS_List*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the [Time](#) Base Selection Mode for a list of input TSs.

Parameters

in	<i>RefPhys</i>	The port on which to configure TSs
in	<i>TBS_List</i>	A list of input TSs with their setting

Exceptions

<i>OpNotSupported</i>	When BoardNr does not identify a Gbe board
<i>OpNotSucceeded</i>	in case - Invalid input references are used - Inconsistency between RefPhys.PortNr and TBS_List[x].RefTSIn.Ref.PortNr in case RefPhys.PortNr != 0xFFFF. - TS does not exist or is not for input

Deprecated Since version 10.30, use TimeBaseSelectionMode_V2_SetL instead

8.8.4.92 void DCM::DeviceControl::TimeBaseSelectionMode_V2_GetL (in IPS_Ref_t *RefPhys*, in IPS_RefTS_List_t *RefTsList*, out InTS_TimeBaseSelectionMode_List_V2_t *TBS_List*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Get the [Time](#) Base Selection Mode for a list of input TSs.

Parameters

in	<i>RefPhys</i>	The port from which to retrieve settings
in	<i>RefTsList</i>	List of TSs for which to retrieve settings
out	<i>TBS_List</i>	A list of Input TSs with their setting

Exceptions

<i>OpNotSupported</i>	When BoardNr does not identify a Gbe board
<i>OperationFailed</i>	in case - Invalid input references are used - Inconsistency between RefPhys.PortNr and RefTsList[x].Ref.PortNr in case RefPhys.PortNr != 0xFFFF. - TS does not exist or is not for input
<i>OpNotSucceeded</i>	: Unspecified error

Version

Supported since release 10.30

8.8.4.93 void DCM::DeviceControl::TimeBaseSelectionMode_V2_SetL (in IPS_Ref_t *RefPhys*, in InTS_TimeBaseSelectionMode_List_V2_t *TBS_List*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Set the [Time](#) Base Selection Mode for a list of input TSs.

Parameters

in	<i>RefPhys</i>	The port on which to configure TSs
in	<i>TBS_List</i>	A list of input TSs with their setting

Exceptions

<i>OpNotSupported</i>	When BoardNr does not identify a Gbe board
<i>OperationFailed</i>	in case • Invalid input references are used • Inconsistency between RefPhys.PortNr and TBS_List[x].RefTSIn.Ref.PortNr in case RefPhys.PortNr != 0xFFFF. • TS does not exist or is not for input
<i>OpNotSucceeded,:</i>	Unspecified error

Version

Supported since release 10.30

8.8.5 Variable Documentation**8.8.5.1 const unsigned long DCM::DeviceControl::ANY_REF = 0xffffffff**

Only for input parameters.

If you want all TS on a port or board.

Definition at line 2290 of file DCM.idl.

8.8.5.2 const unsigned long DCM::DeviceControl::BITMAP_INPUT_TS_ALARM_ACTIVE = 0x100

Will be set when Asi sync Loss of UDP Stream Loss detected.

Definition at line 2338 of file DCM.idl.

8.8.5.3 const unsigned long DCM::DeviceControl::BITMAP_INPUT_TS_EMMS_PRESENT = 0x1

Definition at line 2330 of file DCM.idl.

8.8.5.4 const unsigned long DCM::DeviceControl::BITMAP_INPUT_TS_FEC_COL_PRESENT = 0x200

Will be set when FEC column stream is present.

Definition at line 2339 of file DCM.idl.

8.8.5.5 const unsigned long DCM::DeviceControl::BITMAP_INPUT_TS_FEC_ROW_PRESENT = 0x400

Will be set when FEC row stream is present.

Definition at line 2340 of file DCM.idl.

8.8.5.6 const unsigned long DCM::DeviceControl::BITMAP_INPUT_TS_IN_BACKUP = 0x800

Will be set when TS is in Backup.

Definition at line 2341 of file DCM.idl.

8.8.5.7 `const unsigned long DCM::DeviceControl::BITMAP_INPUT_TS_INPUT_PRESENT = 0x80`

Will be set when there is signal detected.

Definition at line 2337 of file DCM.idl.

8.8.5.8 `const unsigned long DCM::DeviceControl::BITMAP_INPUT_TS_PRIV_DATA_EMMG = 0x4`

Definition at line 2332 of file DCM.idl.

8.8.5.9 `const unsigned long DCM::DeviceControl::BITMAP_INPUT_TS_ROUTED = 0x40`

Will be set when any component is routed to an output.

Definition at line 2336 of file DCM.idl.

8.8.5.10 `const unsigned long DCM::DeviceControl::BITMAP_INPUT_TS_RTP_ON = 0x8`

Definition at line 2333 of file DCM.idl.

8.8.5.11 `const unsigned long DCM::DeviceControl::BITMAP_INPUT_TS_TSLOSS_ALARM_ACTIVE = 0x2000`

Will be set when TsLoss Alarm is active (backup trigger).

Definition at line 2343 of file DCM.idl.

8.8.5.12 `const unsigned long DCM::DeviceControl::BITMAP_INPUT_TS_UNREF_PIDS_PRESENT = 0x2`

Definition at line 2331 of file DCM.idl.

8.8.5.13 `const unsigned long DCM::DeviceControl::BITMAP_INPUT_TS_UNREF_PIDS_ROUTED = 0x1000`

Will be set when unreferenced PIDs are routed.

Definition at line 2342 of file DCM.idl.

8.8.5.14 `const unsigned long DCM::DeviceControl::BITMAP_INPUT_TS_VBR_ON = 0x20`

May be senseless on input but let's try to be symmetrically.

Definition at line 2335 of file DCM.idl.

8.8.5.15 `const unsigned long DCM::DeviceControl::BITMAP_INPUT_TS_VLAN_ON = 0x10`

May be senseless on input but let's try to be symmetrically.

Definition at line 2334 of file DCM.idl.

8.8.5.16 `const unsigned long DCM::DeviceControl::BITMAP_OUTPUT_TS_EMMS_PRESENT = 0x1`

Definition at line 2437 of file DCM.idl.

8.8.5.17 `const unsigned long DCM::DeviceControl::BITMAP_OUTPUT_TS_FEC_COL_PRESENT = 0x200`

Will be set when FEC column stream is enabled.

Definition at line 2443 of file DCM.idl.

8.8.5.18 `const unsigned long DCM::DeviceControl::BITMAP_OUTPUT_TS_FEC_ROW_PRESENT = 0x400`

Will be set when FEC row stream is enabled.

Definition at line 2444 of file DCM.idl.

8.8.5.19 `const unsigned long DCM::DeviceControl::BITMAP_OUTPUT_TS_PRIV_DATA_EMMG = 0x4`

Definition at line 2439 of file DCM.idl.

8.8.5.20 `const unsigned long DCM::DeviceControl::BITMAP_OUTPUT_TS_RTP_ON = 0x8`

Definition at line 2440 of file DCM.idl.

8.8.5.21 `const unsigned long DCM::DeviceControl::BITMAP_OUTPUT_TS_UNREF_PIDS_PRESENT = 0x2`

Definition at line 2438 of file DCM.idl.

8.8.5.22 `const unsigned long DCM::DeviceControl::BITMAP_OUTPUT_TS_VBR_ON = 0x20`

Definition at line 2442 of file DCM.idl.

8.8.5.23 `const unsigned long DCM::DeviceControl::BITMAP_OUTPUT_TS_VLAN_ON = 0x10`

Definition at line 2441 of file DCM.idl.

8.8.5.24 `const unsigned long DCM::DeviceControl::INVALID_REF = 0xffffffff`

Undefined Ref.

Definition at line 2286 of file DCM.idl.

8.9 Service

This contains types, enums and methods to configure the TS Services of the multiplexer part in the device.

Collaboration diagram for Service:

Classes

- struct [DCM::DeviceControl::IPS_Service_t](#)
SID reference.
- struct [DCM::DeviceControl::IPS_Service_In_t](#)
Incoming service information.
- struct [DCM::DeviceControl::IPS_SDT_Data_t](#)
Structure that contains data about the Service Description Table of a service.
- struct [DCM::DeviceControl::IPS_ServiceData_Out_t](#)
- struct [DCM::DeviceControl::IPS_RefSvc_t](#)
A reference to a service.
- struct [DCM::DeviceControl::IPS_Service_In_V2_t](#)
A definition of an input service as used on the output.
- struct [DCM::DeviceControl::IPS_ServiceData_Out_V2_t](#)
Extended information about an output service.
- struct [DCM::DeviceControl::IPS_ServiceData_Out_V3_t](#)
Extended information about an output service.
- struct [DCM::DeviceControl::ServiceBlockCAInfo_t](#)
Outgoing service information.
- struct [DCM::DeviceControl::TC_ServiceData_t](#)
Structure with service data for a transcoder board.
- struct [DCM::DeviceControl::TrackingCriterium_t](#)
- struct [DCM::DeviceControl::MergeCriterium_t](#)
- struct [DCM::DeviceControl::ComponentMergeCriterium_t](#)
- struct [DCM::DeviceControl::IPS_MergedInService_t](#)
- struct [DCM::DeviceControl::AltSrcMergedSetting_t](#)
- struct [DCM::DeviceControl::IPS_Serv_Dest_t](#)
- struct [DCM::DeviceControl::TC_ServiceDataV2_t](#)
Structure with service data for a transcoder board.

Typedefs

- typedef unsigned long [DCM::DeviceControl::ServiceId_t](#)
service id type
- typedef sequence< IPS_Service_t > [DCM::DeviceControl::IPS_Service_List_t](#)
A sequence of [IPS_Service_t](#).
- typedef unsigned long [DCM::DeviceControl::AlternateSrcId_t](#)
alternate source id type
- typedef sequence< ServiceId_t > [DCM::DeviceControl::ServiceIdList_t](#)
List of service ID's to use as a filter in [IPS_InServiceGetL\(\)](#) and [IPS_OutServiceGetL\(\)](#).
- typedef sequence< octet > [DCM::DeviceControl::DvbString_t](#)
- typedef sequence< IPS_Service_In_t > [DCM::DeviceControl::IPS_ServiceIn_List_t](#)
A sequence of [IPS_Service_In_t](#).
- typedef sequence< IPS_ServiceData_Out_t > [DCM::DeviceControl::IPS_ServiceDataOut_List_t](#)
A sequence of [IPS_ServiceData_Out_t](#) entries.
- typedef sequence< IPS_RefSvc_t > [DCM::DeviceControl::IPS_RefSvc_List_t](#)
A sequence of [IPS_RefSvc_t](#) entries.
- typedef sequence< unsigned short > [DCM::DeviceControl::SidList_t](#)
- typedef sequence< IPS_ServiceData_Out_V2_t > [DCM::DeviceControl::IPS_ServiceDataOut_List_V2_t](#)
A sequence of [IPS_ServiceData_Out_V2_t](#) entries.
- typedef sequence< IPS_ServiceData_Out_V3_t > [DCM::DeviceControl::IPS_ServiceDataOut_List_V3_t](#)
A sequence of [IPS_ServiceData_Out_V3_t](#) entries.
- typedef sequence< ServiceBlockCAInfo_t > [DCM::DeviceControl::ServiceBlockCAInfo_List_t](#)
A sequence of [ServiceBlockCAInfo_t](#) entries.
- typedef sequence< TC_ServiceData_t > [DCM::DeviceControl::TC_ServiceData_List_t](#)
A sequence of [TC_ServiceData_t](#) entries.
- typedef sequence< MergeCriterium_t > [DCM::DeviceControl::MergeCriteriumList_t](#)
- typedef sequence< ComponentMergeCriterium_t > [DCM::DeviceControl::ComponentMergeCriteriumList_t](#)
- typedef sequence< IPS_MergedInService_t > [DCM::DeviceControl::IPS_MergedInServiceList_t](#)
- typedef sequence< AlternateSrcId_t > [DCM::DeviceControl::AlternateSrcIdList_t](#)
- typedef sequence< AltSrcMergedSetting_t > [DCM::DeviceControl::AltSrcMergedSettingList_t](#)
A sequence of [AlternateSvcMergedList_t](#) elements.
- typedef unsigned long [DCM::DeviceControl::SourceType_t](#)
bitmap : bit 0 means it is an alternate source < bit 1 means it is a TS backup source < bit 2 means it is a service backup source < bit 3 means it is a merged service source < bit 4 means it is a merged component source < bit 5 means it is a LPI or Ad source < bit 6 means it is an EBIF source < no bits set means it is the main service that was routed
- typedef sequence< SourceType_t > [DCM::DeviceControl::IPS_Serv_Source_List_t](#)
- typedef sequence< IPS_Serv_Dest_t > [DCM::DeviceControl::IPS_Serv_Dest_List_t](#)
- typedef sequence< TC_ServiceDataV2_t > [DCM::DeviceControl::TC_ServiceDataV2_List_t](#)
A sequence of [TC_ServiceData_t](#) entries.

Enumerations

- enum `DCM::DeviceControl::eEitSchedule` { `DCM::DeviceControl::eEitSch_Transparent`, `DCM::DeviceControl::eEitSch_ForceEitScheduleNotPresent`, `DCM::DeviceControl::eEitSch_ForceEitSchedulePresent` }
EIT Schedule flag.
- enum `DCM::DeviceControl::eEitPresentFollow` { `DCM::DeviceControl::eEitPF_Transparent`, `DCM::DeviceControl::eEitPF_ForceEitPresentFollowingNotPresent`, `DCM::DeviceControl::eEitPF_ForceEitPresentFollowingPresent` }
EIT Present Following present flag.
- enum `DCM::DeviceControl::eCaMode` { `DCM::DeviceControl::eCA_Transparent`, `DCM::DeviceControl::eCA_ForceNotScrambled`, `DCM::DeviceControl::eCA_ForceScrambled` }
The Conditional Access (CA) Mode.
- enum `DCM::DeviceControl::eRunningStatus` { `DCM::DeviceControl::eRS_Undefined`, `DCM::DeviceControl::eRS_NotRunning`, `DCM::DeviceControl::eRS_StartSoon`, `DCM::DeviceControl::eRS_Pausing`, `DCM::DeviceControl::eRS_Running`, `DCM::DeviceControl::eRS_Future`, `DCM::DeviceControl::eRS_Transparent` }
The Running status - This indicates the status of the service.
- enum `DCM::DeviceControl::eServiceType` { `DCM::DeviceControl::eST_Transparent`, `DCM::DeviceControl::eST_DigitalTv`, `DCM::DeviceControl::eST_DigitalRadio`, `DCM::DeviceControl::eST_Teletext`, `DCM::DeviceControl::eST_NVODReference`, `DCM::DeviceControl::eST_NVODTimeShifted`, `DCM::DeviceControl::eST_Mosaic`, `DCM::DeviceControl::eST_Pal`, `DCM::DeviceControl::eST_Secam`, `DCM::DeviceControl::eST_Dd2Mac`, `DCM::DeviceControl::eST_FmRadio`, `DCM::DeviceControl::eST_Ntsc`, `DCM::DeviceControl::eST_DataBroadcast`, `DCM::DeviceControl::eST_Reserved`, `DCM::DeviceControl::eST_RcsMap`, `DCM::DeviceControl::eST_RcsFls`, `DCM::DeviceControl::eST_DvbMhp`, `DCM::DeviceControl::eST_Mpeg2HD`, `DCM::DeviceControl::eST_Reserved18`, `DCM::DeviceControl::eST_Reserved19`, `DCM::DeviceControl::eST_Reserved20`, `DCM::DeviceControl::eST_Reserved21`, `DCM::DeviceControl::eST_AdvancedSD`, `DCM::DeviceControl::eST_AdvancedSD_NVOD_TimeShifted`, `DCM::DeviceControl::eST_AdvancedSD_NVOD_Reference`, `DCM::DeviceControl::eST_AdvancedHD`, `DCM::DeviceControl::eST_AdvancedHD_NVOD_TimeShifted`, `DCM::DeviceControl::eST_AdvancedHD_NVOD_Reference` }
The Service Type.
- enum `DCM::DeviceControl::enuTrackTypeV2` { `DCM::DeviceControl::eTrackV2_ComponentTag`, `DCM::DeviceControl::eTrackV2_Pcr`, `DCM::DeviceControl::eTrackV2_StreamType`, `DCM::DeviceControl::eTrackV2_EsPid`, `DCM::DeviceControl::eTrackV2_EcmPid`, `DCM::DeviceControl::eTrackV2_EsEcmPid`, `DCM::DeviceControl::eTrackV2_EcmCasId`, `DCM::DeviceControl::eTrackV2_EsEcmCasId` }
The type of tracking criterium.

Functions

- `IPS_ServiceIn_List_t DCM::DeviceControl::IPS_InServiceGetL` (in `IPS_RefTS_t RefTS`, in `ServiceIdList_t InputSidList`) raises (`Timeout`, `OpNotSucceeded`, `OpNotAllowed`, `OpNotSupported`)
Gets the list of services on an input TS that are passed to an output or currently present in the incoming transport stream.
- `IPS_ServiceDataOut_List_t DCM::DeviceControl::IPS_OutServiceGetL` (in `IPS_RefTS_t RefTS`, in `ServiceIdList_t OutputSidList`) raises (`Timeout`, `OpNotSucceeded`, `OpNotAllowed`, `OpNotSupported`)
Get the list of services on an output TS.
- `void DCM::DeviceControl::IPS_OutServiceDeleteL` (in `IPS_Ref_t RefPhys`, in `IPS_Service_List_t ServiceList`) raises (`Timeout`, `OpNotSucceeded`, `OpNotAllowed`, `OpNotSupported`)

Delete a list of services in one or more TS on the same board.

- void [DCM::DeviceControl::IPS_OutServiceAddL](#) (in IPS_Ref_t RefPhys, in IPS_ServiceDataOut_List_t ServiceDataList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Add a list of services to one or more outgoing TS on the same RefPhys.

- void [DCM::DeviceControl::IPS_InServiceSetL](#) (in IPS_Ref_t RefPhys, in IPS_ServiceIn_List_t ServiceDataList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set service details via a list on an input TS.

- void [DCM::DeviceControl::IPS_OutServiceSetL](#) (in IPS_Ref_t RefPhys, in IPS_ServiceDataOut_List_t ServiceDataList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, License-Error)

Set service details via a list on an output TS.

- void [DCM::DeviceControl::IPS_OutServiceAddMergeL](#) (in IPS_Service_t OutService, in IPS_Service_List_t ServiceMergeList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Merge list of input services into an output service.

- void [DCM::DeviceControl::IPS_OutServiceDelMergeL](#) (in IPS_Service_t OutService, in IPS_Service_List_t ServiceMergeList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

remove list of merged services from an output service.

- void [DCM::DeviceControl::IPS_OutServiceGetMergeL](#) (in IPS_Service_t OutService, out IPS_Merged-InServiceList_t ServiceMergeList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

get list of merged services from an output service.

- void [DCM::DeviceControl::IPS_OutServiceAddMergeL_V2](#) (in IPS_Service_t SvcOut, in AltSrc-MergedSetting_t AltSrcMergedSetting) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Add merged source settings to an output service.

- void [DCM::DeviceControl::IPS_OutServiceGetMergeL_V2](#) (in IPS_Service_t SvcOut, in AlternateSrcIdList_t AlternateSrcIdList, out AltSrcMergedSettingList_t AltSrcMergedSetting) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

get list of merged services for a specific output service

- void [DCM::DeviceControl::IPS_OutServiceDelMergeL_V2](#) (in IPS_Service_t SvcOut, in AltSrc-MergedSetting_t AltSrcMergedSetting) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

remove list of merged services from output services.

- void [DCM::DeviceControl::IPS_OutServiceSetComponentMergeL](#) (in IPS_Service_t OutService, in ComponentMergeCriteriumList_t ComponentMergeList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Sets the list of merged component tracking criteria for an output service.

- void [DCM::DeviceControl::IPS_OutServiceGetComponentMergeL](#) (in IPS_Service_t OutService, out ComponentMergeCriteriumList_t ComponentMergeList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get a list of all merged component tracking criteria from an output service.

- void [DCM::DeviceControl::IPS_LookupOutService](#) (in IPS_RefTS_t OutputTS, in IPS_Service_t InputService, out IPS_Service_t OutputLookedUpService) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets matching output service for an input service and output TS.

- IPS_Serv_Dest_List_t [DCM::DeviceControl::GetDestinations](#) (in IPS_Service_t InputService) raises (TimeOut, OperationFailed, OpNotAllowed, OpNotSupported)

Find where a certain input service is routed to.

- ServiceBlockCAInfo_List_t [DCM::DeviceControl::ServiceBlockCAInfoGetL](#) (in IPS_RefTS_t RefTS, in ServiceIdList_t OutputSidList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Retrieves for every service in the given list, if the BlockCA option is turned on.

- void [DCM::DeviceControl::ServiceBlockCAInfoSetL](#) (in IPS_RefTS_t RefTS, in ServiceBlockCAInfo_List_t ServiceBlockCAInfoList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Enables/disables blocking of CA info for a list of services.

- void [DCM::DeviceControl::IPS_OutServiceSetL_V2](#) (in IPS_Ref_t RefPhys, in IPS_ServiceDataOut_List_V2_t ServiceDataList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

Set service details via a list on an output TS.

- IPS_ServiceDataOut_List_V2_t [DCM::DeviceControl::IPS_OutServiceGetL_V2](#) (in IPS_RefTS_t RefTS, in ServiceIdList_t OutputSidList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the list of services on an output TS.

- IPS_ServiceDataOut_List_V3_t [DCM::DeviceControl::IPS_OutServiceGetL_V3](#) (in IPS_RefTS_t RefTS, in ServiceIdList_t OutputSidList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the list of services on an output TS.

- TC_ServiceData_List_t [DCM::DeviceControl::TC_ServiceGetL](#) (in unsigned short BoardNr, in IPS_RefSvc_List_t RefSvcList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the list of services on a transcoder board.

- void [DCM::DeviceControl::TC_ServiceSetL](#) (in unsigned short BoardNr, in TC_ServiceData_List_t ServiceDataList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set service details of transcoder board services.

- TC_ServiceData_List_t [DCM::DeviceControl::ProcessorServiceAddL](#) (in unsigned short BoardNr, in IPS_RefSvc_List_t InputRefSvcList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Add a list of services to a transcoder or MFP board and returns the output service data for those services.

- TC_ServiceDataV2_List_t [DCM::DeviceControl::TC_ServiceGetLV2](#) (in unsigned short BoardNr, in IPS_RefSvc_List_t RefSvcList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Get the list of services on a transcoder board.

- void [DCM::DeviceControl::TC_ServiceSetLV2](#) (in unsigned short BoardNr, in TC_ServiceDataV2_List_t ServiceDataList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Set service details of transcoder board services.

- void [DCM::DeviceControl::TC_ServiceAddL](#) (in unsigned short BoardNr, in IPS_RefSvc_List_t - InputRefSvcList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Add a list of services to a transcoder board or MFP board.

- void [DCM::DeviceControl::TC_ServiceDeleteL](#) (in unsigned short BoardNr, in IPS_RefSvc_List_t RefSvcList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Delete a list of services on a transcoder board.

Variables

- const ServiceId_t `DCM::DeviceControl::INVALID_SID` = 0xffffffff
Undefined sid.
- const ServiceId_t `DCM::DeviceControl::ANY_SID` = 0xffffffff
Input parameter: Service creation: If you don't want any particular SID.
- const unsigned long `DCM::DeviceControl::BITMAP_INPUT_PRESENT` = 0x1
- const unsigned long `DCM::DeviceControl::BITMAP_SCRAMBLED_BY_DCM` = 0x2
- const unsigned long `DCM::DeviceControl::BITMAP_ACTIVE` = 0x4
- const unsigned long `DCM::DeviceControl::BITMAP_MERGED_SERVICE` = 0x8
For output services.
- const unsigned long `DCM::DeviceControl::BITMAP_SERVICE_ALARM_ACTIVE` = 0x8
For input services.
- const unsigned long `DCM::DeviceControl::BITMAP_SCRAMBLED_ON_INPUT` = 0x10
- const unsigned long `DCM::DeviceControl::BITMAP_OUTPUT_SERVICE_ALARM_ACTIVE` = 0x40
For output services.
- const unsigned long `DCM::DeviceControl::BITMAP_INPUT_SIGNAL_PRESENT` = 0x80000000

8.9.1 Detailed Description

This contains types, enums and methods to configure the TS Services of the multiplexer part in the device.

8.9.2 Typedef Documentation

8.9.2.1 typedef unsigned long DCM::DeviceControl::AlternateSrcId_t

alternate source id type

Definition at line 4720 of file DCM.idl.

8.9.2.2 typedef sequence<AlternateSrcId_t> DCM::DeviceControl::AlternateSrcIdList_t

Definition at line 5262 of file DCM.idl.

8.9.2.3 typedef sequence<AltSrcMergedSetting_t> DCM::DeviceControl::AltSrcMergedSettingList_t

A sequence of AlternateSvcMergedList_t elements.

Definition at line 5271 of file DCM.idl.

8.9.2.4 typedef sequence<ComponentMergeCriterium_t> DCM::DeviceControl::ComponentMergeCriteriumList_t

Definition at line 5076 of file DCM.idl.

8.9.2.5 typedef sequence<octet> DCM::DeviceControl::DvbString_t

Definition at line 4727 of file DCM.idl.

8.9.2.6 typedef sequence<IPS_MergedInService_t> DCM::DeviceControl::IPS_MergedInServiceList_t

Definition at line 5219 of file DCM.idl.

8.9.2.7 typedef sequence<IPS_RefSvc_t> DCM::DeviceControl::IPS_RefSvc_List_t

A sequence of [IPS_RefSvc_t](#) entries.

Definition at line 4909 of file DCM.idl.

8.9.2.8 typedef sequence<IPS_Serv_Dest_t> DCM::DeviceControl::IPS_Serv_Dest_List_t

Definition at line 5409 of file DCM.idl.

8.9.2.9 typedef sequence< SourceType_t > DCM::DeviceControl::IPS_Serv_Source_List_t

Definition at line 5401 of file DCM.idl.

8.9.2.10 typedef sequence<IPS_Service_t> DCM::DeviceControl::IPS_Service_List_t

A sequence of [IPS_Service_t](#).

Definition at line 4717 of file DCM.idl.

8.9.2.11 typedef sequence<IPS_ServiceData_Out_t> DCM::DeviceControl::IPS_ServiceDataOut_List_t

A sequence of [IPS_ServiceData_Out_t](#) entries.

Definition at line 4898 of file DCM.idl.

8.9.2.12 typedef sequence<IPS_ServiceData_Out_V2_t> DCM::DeviceControl::IPS_ServiceDataOut_List_V2_t

A sequence of [IPS_ServiceData_Out_V2_t](#) entries.

Definition at line 4951 of file DCM.idl.

8.9.2.13 typedef sequence<IPS_ServiceData_Out_V3_t> DCM::DeviceControl::IPS_ServiceDataOut_List_V3_t

A sequence of [IPS_ServiceData_Out_V3_t](#) entries.

Definition at line 4983 of file DCM.idl.

8.9.2.14 typedef sequence<IPS_Service_In_t> DCM::DeviceControl::IPS_ServiceIn_List_t

A sequence of [IPS_Service_In_t](#).

Definition at line 4756 of file DCM.idl.

8.9.2.15 typedef sequence<MergeCriterium_t> DCM::DeviceControl::MergeCriteriumList_t

Definition at line 5065 of file DCM.idl.

8.9.2.16 typedef sequence<ServiceBlockCAInfo_t> DCM::DeviceControl::ServiceBlockCAInfo_List_t

A sequence of [ServiceBlockCAInfo_t](#) entries.

Definition at line 4995 of file DCM.idl.

8.9.2.17 typedef unsigned long DCM::DeviceControl::ServiceId_t

service id type

Definition at line 4699 of file DCM.idl.

8.9.2.18 typedef sequence<ServiceId_t> DCM::DeviceControl::ServiceIdList_t

List of service ID's to use as a filter in [IPS_InServiceGetL\(\)](#) and [IPS_OutServiceGetL\(\)](#).

Note

This used to be a list of short which was inconsistent. SID is an unsigned long.

Definition at line 4725 of file DCM.idl.

8.9.2.19 typedef sequence<unsigned short> DCM::DeviceControl::SidList_t

Definition at line 4911 of file DCM.idl.

8.9.2.20 typedef unsigned long DCM::DeviceControl::SourceType_t

bitmap : bit 0 means it is an alternate source < bit 1 means it is a TS backup source < bit 2 means it is a service backup source < bit 3 means it is a merged service source < bit 4 means it is a merged component source < bit 5 means it is a LPI or Ad source < bit 6 means it is an EBIF source < no bits set means it is the main service that was routed

Definition at line 5392 of file DCM.idl.

8.9.2.21 typedef sequence<TC_ServiceData_t> DCM::DeviceControl::TC_ServiceData_List_t

A sequence of [TC_ServiceData_t](#) entries.

Definition at line 5021 of file DCM.idl.

8.9.2.22 typedef sequence<TC_ServiceDataV2_t> DCM::DeviceControl::TC_ServiceDataV2_List_t

A sequence of [TC_ServiceData_t](#) entries.

Definition at line 5614 of file DCM.idl.

8.9.3 Enumeration Type Documentation**8.9.3.1 enum DCM::DeviceControl::eCaMode**

The Conditional Access (CA) Mode.

when set to "eCA_ForceNotScrambled" indicates that all the component streams of the service are not scrambled. When set to "eCA_ForceScrambled" it indicates that access to one or more streams may be controlled by a CA system.

Enumerator:

eCA_Transparent

eCA_ForceNotScrambled

eCA_ForceScrambled

Definition at line 4788 of file DCM.idl.

8.9.3.2 enum DCM::DeviceControl::eEitPresentFollow

EIT Present Following present flag.

when set to "eEitPF_ForceEitPresentFollowingPresent" indicates that EIT_present_following information for the service is present in the current TS,

Enumerator:

eEitPF_Transparent

eEitPF_ForceEitPresentFollowingNotPresent

eEitPF_ForceEitPresentFollowingPresent

Definition at line 4775 of file DCM.idl.

8.9.3.3 enum DCM::DeviceControl::eEitSchedule

EIT Schedule flag.

when set to "eEitSch_ForceEitSchedulePresent" indicates that EIT schedule information for the service is present in the current TS.

Enumerator:

eEitSch_Transparent

eEitSch_ForceEitScheduleNotPresent

eEitSch_ForceEitSchedulePresent

Definition at line 4763 of file DCM.idl.

8.9.3.4 enum DCM::DeviceControl::enuTrackTypeV2

The type of tracking criterium.

Enumerator:

eTrackV2_ComponentTag

eTrackV2_Pcr

eTrackV2_StreamType

eTrackV2_EsPid m_usInputPid <> INVALID_PID_VALUE, m_usInputECM_PID == INVALID_PID_VALUE.

eTrackV2_EcmPid m_usInputECM_PID <> INVALID_PID_VALUE, m_usInputPid == INVALID_PID_VALUE.

eTrackV2_EsEcmPid m_usInputECM_PID <> INVALID_PID_VALUE, m_usInputPid <> INVALID_PID_VALUE.

eTrackV2_EcmCasId

eTrackV2_EsEcmCasId

Definition at line 5024 of file DCM.idl.

8.9.3.5 enum DCM::DeviceControl::eRunningStatus

The Running status - This indicates the status of the service.

Enumerator:

- eRS_Undefined*
- eRS_NotRunning*
- eRS_StartSoon*
- eRS_Pausing*
- eRS_Running*
- eRS_Future*
- eRS_Transparent*

Definition at line 4797 of file DCM.idl.

8.9.3.6 enum DCM::DeviceControl::eServiceType

The Service Type.

NOTE: as of V04-05-22: eST_Undefined was at place 0, but it has been replaced by eST_Transparent because the enum has been expanded.

Enumerator:

- eST_Transparent*
- eST_DigitalTv*
- eST_DigitalRadio*
- eST_Teletext*
- eST_NVODReference*
- eST_NVODTimeShifted*
- eST_Mosaic*
- eST_Pal*
- eST_Secam*
- eST_Dd2Mac*
- eST_FmRadio*
- eST_Ntsc*
- eST_DataBroadcast*
- eST_Reserved*
- eST_RcsMap*
- eST_RcsFls*
- eST_DvbMhp*
- eST_Mpeg2HD*
- eST_Reserved18*
- eST_Reserved19*
- eST_Reserved20*
- eST_Reserved21*

eST_AdvancedSD
eST_AdvancedSD_NVOD_TimeShifted
eST_AdvancedSD_NVOD_Reference
eST_AdvancedHD
eST_AdvancedHD_NVOD_TimeShifted
eST_AdvancedHD_NVOD_Reference

Definition at line 4813 of file DCM.idl.

8.9.4 Function Documentation

8.9.4.1 IPS_Serv_Dest_List_t DCM::DeviceControl::GetDestinations (in IPS_Service_t *InputService*)
raises (TimeOut, OperationFailed, OpNotAllowed, OpNotSupported)

Find where a certain input service is routed to.

Parameters

in	<i>InputService,:</i>	The IPS_Service_t of the source you want to find the destinations for
----	-----------------------	---

Returns

IPS_Serv_Dest_List_t List if [IPS_Serv_Dest_t](#) entries

Exceptions

<i>OperationFailed</i>	In case invalid input references are used.
------------------------	--

Note

- No wildcard support on the input service, you can only find the destinations of one input service.

8.9.4.2 IPS_ServiceIn_List_t DCM::DeviceControl::IPS_InServiceGetL (in IPS_RefTS_t *RefTS*, in ServiceIdList_t *InputSidList*)
raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the list of services on an input TS that are passed to an output or currently present in the incoming transport stream.

Remark that input services which have Service Loss specific settings that are not present in the input transport stream and not passed to any output are NOT returned in this call. Use the call GetServiceLoss-Triggers to retrieve this info for these services.

Parameters

in	<i>RefTS</i>	A BoardNr, PortNr and Ref specifying the TS.
in	<i>InputSidList</i>	A list of Service ID's to get info about.

Returns

IPS_ServiceIn_List_t List of [IPS_Service_In_t](#) entries.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case invalid input references are used (RefTS, InputSidList).

Note

- A value of 0xFFFFFFFF for Ref means get services on all TS's on a physical port.
- An empty InputSidList list returns information about all services.
- SystemName is the SDT name. If the SDT name doesn't exist (or is empty) the UserName field becomes the displayed name.

8.9.4.3 void DCM::DeviceControl::IPS_InServiceSetL (in IPS_Ref_t *RefPhys*, in IPS_ServiceIn_List_t *ServiceDataList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set service details via a list on an input TS.

Parameters

in	<i>RefPhys</i>	BoardNr and PortNr specifying the port of the service.
in	<i>ServiceDataList</i>	A list of IPS_Service_In_t specifying the service to be modified, holding the ServiceInProperty bitmap and UserName for each service.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case invalid input references are used (RefPhys, ServiceDataList).

Note

- UserName field is only valid and changeable when input ServiceName is NULL.

8.9.4.4 void DCM::DeviceControl::IPS_LookupOutService (in IPS_RefTS_t *OutputTS*, in IPS_Service_t *InputService*, out IPS_Service_t *OutputLookedUpService*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets matching output service for an input service and output TS.

Parameters

in	<i>OutputTS</i>	
in	<i>InputService</i>	
out	<i>OutputLookedUpService</i>	

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case invalid input references are used (RefPhys, OutTS, Service).

Returns

OutputService

8.9.4.5 void DCM::DeviceControl::IPS_OutServiceAddL (in IPS_Ref_t RefPhys, in IPS_ServiceDataOut_List_t ServiceDataList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Add a list of services to one or more outgoing TS on the same RefPhys.

Parameters

in	<i>RefPhys</i>	BoardNr and PortNr specifying the port to add services.
in	<i>ServiceDataList</i>	Specifies on which ref to add and which service to be added

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	in case of - Invalid references are used (RefPhys,...) - Inconsistency between RefPhys.BoardNr & ServiceDataList[x].RefOut.Phys-Ref.BoardNr. - Inconsistency between RefPhys.PortNr & ServiceDataList[x].RefOut.Phys-Ref.PortNr in case RefPhys.PortNr != 0xFFFF. - Out of range SIDs

Note

- Pre-configuration is possible.
- An OutputSID value will be assigned by the software when the OutputSID value is set to 0xFFFFFFF in the IDL call. If another value is supplied it will be used for the OutputSID unless the value is already in use (no remapping will occur for a conflict).
- SystemName, UserName, OutputUserName are not used in this function and should be NULL.
- FixedRemap and UseOutputUserName are not used in this function and should be NULL.
- The SDT fields (EIT flags, CA, runningstatus) are not used in this function and should be NULL.

8.9.4.6 void DCM::DeviceControl::IPS_OutServiceAddMergeL (in IPS_Service_t OutService, in IPS_Service_List_t ServiceMergeList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Merge list of input services into an output service.

Parameters

in	<i>OutService</i>	The service in which the input services must be merged.
in	<i>ServiceMerge-List</i>	A list of input services to be merged.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case - invalid input references are used (RefPhys, OutService, ServiceMergeList). - already merged in service in ServiceMergeList

Note

already merged in services are not touched

8.9.4.7 void DCM::DeviceControl::IPS_OutServiceAddMergeL_V2 (in IPS_Service_t *SvcOut*, in AltSrcMergedSetting_t *AltSrcMergedSetting*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Add merged source settings to an output service.

Parameters

in	<i>SvcOut</i>	The SvcOut on which the settings should be applied
in	<i>AltSrcMerged-Setting</i>	the settings

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case - invalid input references are used (SvcOut) - an AlternateSrcId does not exist - an merged service is added twice to the same alternate source

Note

Existing merged services are untouched

Version

Release 7.1

8.9.4.8 void DCM::DeviceControl::IPS_OutServiceDeleteL (in IPS_Ref_t *RefPhys*, in IPS_Service_List_t *ServiceList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Delete a list of services in one or more TS on the same board.

Parameters

in	<i>RefPhys</i>	A BoardNr, PortNr and Ref specifying the TS.
in	<i>ServiceList</i>	A list of services to delete.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case • Invalid references are used (RefTS, ServiceList). • Inconsistency between RefTS.PhysRef.BoardNr & ServiceList[x].Ref.PhysRef.BoardNr. • Inconsistency between RefTS.PhysRef.PortNr & ServiceList[x].Ref.PhysRef.PortNr in case RefTS.RefPhys.PortNr != 0xFFFF. • Inconsistency between RefTS.Ref & ServiceList[x].Ref.Ref in case RefTS.-RefPhys.Ref != 0xFFFF.

Note

Services are also deleted when OutputTS gets deleted.

8.9.4.9 void DCM::DeviceControl::IPS_OutServiceDelMergeL (in IPS_Service_t *OutService*, in IPS_Service_List_t *ServiceMergeList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

remove list of merged services from an output service.

Parameters

in	<i>OutService</i>	The service from which the merged services must be removed.
in	<i>ServiceMergeList</i>	A list of merged services to be removed.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case • invalid input references are used (RefPhys, OutService, ServiceMergeList). • not found merged in service in ServiceMergeList

Note

an empty ServiceMergeList means delete all merged in services

8.9.4.10 void DCM::DeviceControl::IPS_OutServiceDelMergeL_V2 (in IPS_Service_t *SvcOut*, in AltSrcMergedSetting_t *AltSrcMergedSetting*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

remove list of merged services from output services.

Parameters

in	<i>SvcOut</i>	The SvcOut on which the settings should be applied
in	<i>AltSrcMerged-Setting</i>	the settings that must be deleted

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case - invalid input references are used (RefPhys, OutService, ServiceMergeList). - not found merged in service in ServiceMergeList

Note

- an empty AlternateSourceMergedList for an Output Service means delete all merged services for this Output Service

Version

Release 7.1

8.9.4.11 void DCM::DeviceControl::IPS_OutServiceGetComponentMergeL (in IPS_Service_t *OutService*, out ComponentMergeCriterionList_t *ComponentMergeList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get a list of all merged component tracking criteria from an output service.

Parameters

in	<i>OutService</i>	: The service from which the merged component criteria must be retrieved.
out	<i>Component-MergeList</i>	: A list of retrieved merged services.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case invalid input references are used (RefPhys, OutService).

Version

Release 7.1

8.9.4.12 IPS_ServiceDataOut_List_t DCM::DeviceControl::IPS_OutServiceGetL (in IPS_RefTS_t *RefTS*, in ServiceIdList_t *OutputSidList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the list of services on an output TS.

Parameters

in	<i>RefTS</i>	A BoardNr, PortNr and Ref specifying the TS.
in	<i>OutputSidList</i>	A list of Service ID's to get info about.

Returns

IPS_ServiceDataOut_List_t List of IPS_ServiceOut_t entries

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case invalid output references are used (RefTS, OutputSidList).

Note

- A value of 0xFFFFFFFF for Ref means get services on all TS's on a physical port.
- Also for DPI it will be necessary to set/get a separate user name.
- An empty OutputSidList list returns information about all services.
- SystemName will be the displayed name for the input service, the UserName field is not used and will be empty.
- If UseOutputUserName is unchecked, the SystemName will be the output SDT name.
- If UseOutputUserName is checked, OutputUserName will be the output SDT name.
- The SDT flags reflect the input SDT values (if present), and the other fields reflect the current settings.
- The SDT service provider name will be the input name unless UseOutputServiceProviderName is checked.

8.9.4.13 `IPS_ServiceDataOut_List_V2_t DCM::DeviceControl::IPS_OutServiceGetL_V2 ( in IPS_RefTS_t RefTS, in ServiceIdList_t OutputSidList ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)`

Get the list of services on an output TS.

Parameters

in	<i>RefTS</i>	A BoardNr, PortNr and Ref specifying the TS.
in	<i>OutputSidList</i>	A list of Service ID's to get info about.

Returns

IPS_ServiceDataOut_List_V2_t List of [IPS_ServiceData_Out_V2_t](#) entries

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case invalid output references are used (RefTS, OutputSidList).

Note

- A value of 0xFFFFFFFF for Ref means get services on all TS's on a physical port.
- Also for DPI it will be necessary to set/get a separate user name.
- An empty OutputSidList list returns information about all services.
- SystemName will be the displayed name for the input service, the UserName field is not used and will be empty.
- If UseOutputUserName is unchecked, the SystemName will be the output SDT name.
- If UseOutputUserName is checked, OutputUserName will be the output SDT name.
- The SDT flags reflect the input SDT values (if present), and the other fields reflect the current settings.
- The SDT service provider name will be the input name unless UseOutputServiceProviderName is checked.

8.9.4.14 `IPS_ServiceDataOut_List_V3_t DCM::DeviceControl::IPS_OutServiceGetL_V3 ( in IPS_RefTS_t RefTS, in ServiceIdList_t OutputSidList )` raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the list of services on an output TS.

Parameters

in	<i>RefTS</i>	A BoardNr, PortNr and Ref specifying the TS.
in	<i>OutputSidList</i>	A list of Service ID's to get info about.

Returns

IPS_ServiceDataOut_List_V3_t List of [IPS_ServiceData_Out_V3_t](#) entries

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case invalid output references are used (RefTS, OutputSidList).

Note

- A value of 0xFFFFFFFF for Ref means get services on all TS's on a physical port.
- Also for DPI it will be necessary to set/get a separate user name.
- An empty OutputSidList list returns information about all services.
- SystemName will be the displayed name for the input service, the UserName field is not used and will be empty.
- If UseOutputUserName is unchecked, the SystemName will be the output SDT name.
- If UseOutputUserName is checked, OutputUserName will be the output SDT name.
- The SDT flags reflect the input SDT values (if present), and the other fields reflect the current settings.
- The SDT service provider name will be the input name unless UseOutputServiceProviderName is checked.

8.9.4.15 void DCM::DeviceControl::IPS_OutServiceGetMergeL (in IPS_Service_t *OutService*, out IPS_MergedInServiceList_t *ServiceMergeList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

get list of merged services from an output service.

Parameters

in	<i>OutService</i>	The service from which the merged services must be retrieved.
out	<i>ServiceMergeList</i>	A list of retrieved merged services.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case invalid input references are used (RefPhys, OutService).

8.9.4.16 void DCM::DeviceControl::IPS_OutServiceGetMergeL_V2 (in IPS_Service_t *SvcOut*, in AlternateSrcIdList_t *AlternateSrcIdList*, out AltSrcMergedSettingList_t *AltSrcMergedSetting*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

get list of merged services for a specific output service

Parameters

in	<i>SvcOut</i>	The SvcOut on which the settings are
in	<i>AlternateSrcIdList</i>	The IDs of the alternate sources for which settings are requested. If empty, then settings of all services on the TS are returned.
out	<i>AltSrcMergedSetting</i>	the settings

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case invalid input references are used (RefPhys, OutService).

Version

Release 7.1

8.9.4.17 void DCM::DeviceControl::IPS_OutServiceSetComponentMergeL (in IPS_Service_t *OutService*, in ComponentMergeCriteriumList_t *ComponentMergeList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Sets the list of merged component tracking criteria for an output service.

The MergeCriteriumList of the AlternateService/ServiceIn combinations present in the ComponentMergeList will be updated with the new values. All MergeCriteriumLists of AlternateService/ServiceIn combinations not present in the ComponentMergeList stay unaffected

Parameters

in	<i>OutService</i>	: The service in which the input component(s) must be merged.
in	<i>ComponentMergeList</i>	: A list of input service component tracking criteria.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case : • Invalid input references are used (RefPhys, OutService). • Invalid reference (OutService). • Trying to apply the same rule more than once. • trying to set several MergeCriteriumLists for the same AlternateService/-ServiceIn combination

Note

- The MergedComponents entry in the [MergeCriterium_t](#) is ignored in the Set call.
- An empty MergeCriteriumList for a AlternateService/Servicein combination in the Component-MergeList will delete the component merge criteria for the specific ServiceIn.
- An empty ComponentMergeCriteriumList will delete all component merge tracking criteria for all AlternateService/ServiceIn combinations of the OutService.

Version

Release 7.1

8.9.4.18 void DCM::DeviceControl::IPS_OutServiceSetL (in IPS_Ref_t *RefPhys*, in IPS_ServiceDataOut_List_t *ServiceDataList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

Set service details via a list on an output TS.

Parameters

in	<i>RefPhys</i>	BoardNr and PortNr specifying the port of the service.
in	<i>ServiceData-List</i>	A list of IPS_Service_In_t . They uniquely identify the output service and specify the ServiceOutProperty, FixedRemap, OutputSID and/or -UseOutputUserName, OutputUserName for each service.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case invalid input references are used (RefPhys, ServiceDataList).
<i>LicenseError</i>	in case of • no licenses left • already existing TS with same ONID/TSID has services with license

Note

- Read/ Write fields of ServiceOutProperty can be set via this call.
- Read only fields are ignored.
- OutputUserName change is specified via UseOutputUserName boolean.

- OutputSID change is specified via FixedRemap boolean.
- EIT output flag changes are specified via corresponding enum setting
- EITschOut
- EITpfOut
- CAmodeOut
- RunStatusOut
- ServiceType
- ServiceProviderNameOut change is specified via UseOutputServiceProviderName boolean.

8.9.4.19 void DCM::DeviceControl::IPS_OutServiceSetL_V2 (in IPS_Ref_t *RefPhys*, in IPS_ServiceDataOut_List_V2_t *ServiceDataList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

Set service details via a list on an output TS.

Parameters

in	<i>RefPhys</i>	BoardNr and PortNr specifying the port of the service.
in	<i>ServiceDataList</i>	A list of IPS_ServiceDataOut_List_V2_t. They uniquely identify the output service and specify the ServiceOutProperty, FixedRemap, OutputSID and/or UseOutputUserName, OutputUserName for each service.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case invalid references are used (RefPhys, ServiceDataList).
<i>LicenseError</i>	in case of • no licenses left • already existing TS with same ONID/TSID has services with license

Note

- Read/Write fields of ServiceOutProperty can be set via this call.
- Read only fields are ignored.
- OutputUserName change is specified via UseOutputUserName boolean.
- OutputSID change is specified via FixedRemap boolean.
- EIT output flag changes are specified via corresponding enum setting
- EITschOut
- EITpfOut
- CAmodeOut
- RunStatusOut
- ServiceType
- ServiceProviderNameOut change is specified via UseOutputServiceProviderName boolean.

8.9.4.20 `TC_ServiceData_List_t DCM::DeviceControl::ProcessorServiceAddL ( in unsigned short BoardNr, in IPS_RefSvc_List_t InputRefSvcList )` raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Add a list of services to a transcoder or MFP board and returns the output service data for those services.

Parameters

in	<i>BoardNr</i>	number of the board on which services are added
in	<i>InputRefSvcList</i>	list of RefSvc of the (IO board) input services

Returns

`TC_ServiceData_List_t` List of [TC_ServiceData_t](#) entries containing info of the passed services. Note: Service names might still be empty.

Exceptions

<i>TimeOut</i>	A timeout occurred during IIOP processing
<i>OpNotSucceeded</i>	- invalid references are used - If the limit of 16 services per transcoder board is exceeded - If the limit of 128 services per MFP board is exceeded
<i>OpNotAllowed</i>	not logged in
<i>OpNotSupported</i>	if BoardNr is not the board number of a transcoder or MFP board

Version

Release 9.0

8.9.4.21 `ServiceBlockCAInfo_List_t DCM::DeviceControl::ServiceBlockCAInfoGetL ( in IPS_RefTS_t RefTS, in ServiceIdList_t OutputSidList )` raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Retrieves for every service in the given list, if the BlockCA option is turned on.

Parameters

in	<i>RefTS</i>	A BoardNr, PortNr and Ref specifying the TS.
in	<i>OutputSidList</i>	A list of Service ID's to get info about.

Returns

List of `ServiceBlockCAInfo_List_t` entries

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case invalid output references are used (RefTS, OutputSidList).

8.9.4.22 void DCM::DeviceControl::ServiceBlockCAInfoSetL (in IPS_RefTS_t *RefTS*, in ServiceBlockCAInfo_List_t *ServiceBlockCAInfoList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Enables/disables blocking of CA info for a list of services.

Parameters

in	<i>RefTS</i>	A BoardNr, PortNr and Ref specifying the TS.
in	<i>ServiceBlockCAInfoList</i>	A list of services and the option to set on each service

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case invalid input references are used (RefTS, InputSidList).

8.9.4.23 void DCM::DeviceControl::TC_ServiceAddL (in unsigned short *BoardNr*, in IPS_RefSvc_List_t *InputRefSvcList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Add a list of services to a transcoder board or MFP board.

Parameters

in	<i>BoardNr</i>	number of the board on which services are added
in	<i>InputRefSvcList</i>	list of RefSvc of the (IO board) input services

Exceptions

<i>TimeOut</i>	A timeout occurred during IIOP processing
<i>OpNotSucceeded</i>	- invalid references are used - If the limit of 16 services per transcoder board is exceeded - If the limit of 128 services per MFP board is exceeded
<i>OpNotAllowed</i>	not logged in
<i>OpNotSupported</i>	if BoardNr is not the board number of a transcoder board

Version

Release 7.5

8.9.4.24 void DCM::DeviceControl::TC_ServiceDeleteL (in unsigned short *BoardNr*, in IPS_RefSvc_List_t *RefSvcList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Delete a list of services on a transcoder board.

The service is only deleted if the service is not passed anymore to an IO board.

Parameters

in	<i>BoardNr</i>	the number of the transcoder board
in	<i>RefSvcList</i>	A list of services to delete.

Exceptions

<i>OpNotSucceeded</i>	In case - Invalid references are used (RefSvcList). - Inconsistency between BoardNr & ServiceList[x].Ref.PhysRef.BoardNr. - At least one of the services is passed to an IO board.
<i>OpNotAllowed</i>	not logged in
<i>OpNotSupported</i>	if BoardNr is not the board number of a transcoder board

Version

Release 7.5

8.9.4.25 TC_ServiceData_List_t DCM::DeviceControl::TC_ServiceGetL (in unsigned short *BoardNr*, in IPS_RefSvc_List_t *RefSvcList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the list of services on a transcoder board.

Parameters

in	<i>BoardNr</i>	number of the transcoder board
in	<i>RefSvcList</i>	list of RefSvc of the transcoder board services for which to return the service data. For an empty list, data of all services are returned. The first time this function is called, the list should be empty in order to return all services. Afterwards, a list of RefSvc (first parameter of the returned TC_ServiceData_t structures) can be used to pass as second parameter of this function, in order to get the service data of a subset of services.

Returns

TC_ServiceData_List_t List of [TC_ServiceData_t](#) entries

Exceptions

<i>TimeOut</i>	A timeout occurred during IIOP processing
<i>OpNotSucceeded</i>	invalid references are used
<i>OpNotAllowed</i>	not logged in
<i>OpNotSupported</i>	if BoardNr is not the board number of a transcoder board

Version

Release 7.5

8.9.4.26 `TC_ServiceDataV2_List_t DCM::DeviceControl::TC_ServiceGetLV2 ( in unsigned short BoardNr, in IPS_RefSvc_List_t RefSvcList )` raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Get the list of services on a transcoder board.

Parameters

in	<i>BoardNr</i>	number of the transcoder board
in	<i>RefSvcList</i>	list of RefSvc of the transcoder board services for which to return the service data. For an empty list, data of all services are returned. The first time this function is called, the list should be empty in order to return all services. Afterwards, a list of RefSvc (first parameter of the returned TC_ServiceData_t structures) can be used to pass as second parameter of this function, in order to get the service data of a subset of services.

Returns

`TC_ServiceDataV2_List_t` List of [TC_ServiceData_t](#) entries

Exceptions

<i>TimeOut</i>	A timeout occurred during IIOP processing
<i>OpNotSucceeded</i>	invalid references are used
<i>OpNotAllowed</i>	not logged in
<i>OpNotSupported</i>	if <i>BoardNr</i> is not the board number of a transcoder board
<i>OperationFailed</i>	TODO

Version

Release 11.10

8.9.4.27 `void DCM::DeviceControl::TC_ServiceSetL ( in unsigned short BoardNr, in TC_ServiceData_List_t ServiceDataList )` raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set service details of transcoder board services.

Parameters

in	<i>BoardNr</i>	number of the transcoder board
in	<i>ServiceData-List</i>	list of TC_ServiceData_t specifying the service data details for modification.

Exceptions

<i>TimeOut</i>	A timeout occurred during IIOP processing
<i>OpNotSucceeded</i>	invalid references are used or when trying to change User Tag of a PIP service
<i>OpNotAllowed</i>	not logged in

<i>OpNotSupported</i>	if BoardNr is not the board number of a transcoder board
-----------------------	--

Version

Release 7.5

8.9.4.28 void DCM::DeviceControl::TC_ServiceSetLV2 (in unsigned short *BoardNr*, in TC_ServiceDataV2_List_t *ServiceDataList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Set service details of transcoder board services.

Parameters

in	<i>BoardNr</i>	number of the transcoder board
in	<i>ServiceDataList</i>	list of TC_ServiceData_t specifying the service data details for modification.

Exceptions

<i>TimeOut</i>	A timeout occurred during IIOP processing
<i>OpNotSucceeded</i>	invalid references are used or when trying to change User Tag of a PIP service
<i>OpNotAllowed</i>	not logged in
<i>OpNotSupported</i>	if BoardNr is not the board number of a transcoder board
<i>OperationFailed</i>	TODO

Version

Release 7.5

8.9.5 Variable Documentation

8.9.5.1 const ServiceId_t DCM::DeviceControl::ANY_SID = 0xffffffff

Input parameter: Service creation: If you don't want any particular SID.

8.10 Pid

This contains types, enums and methods to configure the pid settings of the multiplexer part in the device.

Collaboration diagram for Pid:

Classes

- struct [DCM::DeviceControl::InPID_Data_t](#)
Identification of which PID to be (un)blocked.
- struct [DCM::DeviceControl::ServicePIDStatus_t](#)
Identification of the service(s) to (un)block PIDs in.
- struct [DCM::DeviceControl::ServiceCompSettings_t](#)
- struct [DCM::DeviceControl::ComponentTag_t](#)
- struct [DCM::DeviceControl::ComponentTrackRule_t](#)
- struct [DCM::DeviceControl::ComponentTrackRule_V2_t](#)
- struct [DCM::DeviceControl::DefaultTrackRule_t](#)
Structure for board default component tracking rules.
- struct [DCM::DeviceControl::ES_TypeSetting_t](#)
- struct [DCM::DeviceControl::SvcOutES_TypeSetting_t](#)
- struct [DCM::DeviceControl::ServiceES_t](#)
- struct [DCM::DeviceControl::IPS_LanguageSettings_t](#)
- struct [DCM::DeviceControl::IPS_Out_PIDSettings_t](#)
- struct [DCM::DeviceControl::IPS_Out_ECMSettings_t](#)
- struct [DCM::DeviceControl::IPS_Out_ESSettings_t](#)
- struct [DCM::DeviceControl::IPS_Out_ServiceComponents_t](#)
- struct [DCM::DeviceControl::IPS_Out_ESSettings_V2_t](#)
- struct [DCM::DeviceControl::IPS_Out_ServiceComponents_V2_t](#)
- struct [DCM::DeviceControl::PcrSetting_t](#)
- struct [DCM::DeviceControl::IPS_In_ECMSettings_t](#)
- struct [DCM::DeviceControl::IPS_In_ESSettings_t](#)
- struct [DCM::DeviceControl::IPS_In_ServiceComponents_t](#)
- struct [DCM::DeviceControl::TableGenerationData_t](#)
- struct [DCM::DeviceControl::TableGenerationData_V2_t](#)
- struct [DCM::DeviceControl::SvcOutStreamingSetting_t](#)

Typedefs

- typedef sequence < ServicePIDStatus_t > DCM::DeviceControl::ServicePIDStatus_List_t
A sequence of *ServicePIDStatus_t*.
- typedef sequence < ServiceCompSettings_t > DCM::DeviceControl::ServiceCompSettingsList_t
A sequence of *ServiceCompSettings_t*.

A sequence of *IPS_In_ServiceComponents_t*.
- typedef sequence < TableGenerationData_t > DCM::DeviceControl::TableGenerationDataList_t
A sequence of *TableGenerationData_t*.

- typedef sequence < TableGenerationData_V2_t > [DCM::DeviceControl::TableGenerationDataList_V2_t](#)
A sequence of [TableGenerationData_t](#).
- typedef sequence < SvcOutStreamingSetting_t > [DCM::DeviceControl::SvcOutStreamingSettingList_t](#)
A sequence of [SvcStreamingState_t](#).

Enumerations

- enum [DCM::DeviceControl::enuTrackType](#) { [DCM::DeviceControl::eTrackComponentTag](#), [DCM::DeviceControl::eTrackPcr](#), [DCM::DeviceControl::eTrackStreamType](#), [DCM::DeviceControl::eTrackEsPid](#), [DCM::DeviceControl::eTrackEcmPid](#), [DCM::DeviceControl::eTrackEsEcmPid](#) }
What information of a PID we're tracking.
- enum [DCM::DeviceControl::enuRuleSetting](#) { [DCM::DeviceControl::eRuleBlock](#), [DCM::DeviceControl::eRuleForce](#), [DCM::DeviceControl::eRulePass](#) }
What the intention of a rule can be.
- enum [DCM::DeviceControl::enuDefaultRuleSetting](#) { [DCM::DeviceControl::eDefaultRuleBlock](#), [DCM::DeviceControl::eDefaultRuleForce](#), [DCM::DeviceControl::eDefaultRulePass](#) }
What the intention of a rule can be.

Functions

- void [DCM::DeviceControl::SetSvcOutStreaming](#) (in [IPS_RefTS_t](#) RefTs, in [SvcOutStreamingSettingList_t](#) SvcOutStreamingSettingList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Set Output Service streaming state.
- [SvcOutStreamingSettingList_t](#) [DCM::DeviceControl::GetSvcOutStreaming](#) (in [IPS_RefTS_t](#) RefTs, in [ServiceIdList_t](#) SidList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get Output Service streaming state.
- void [DCM::DeviceControl::SetDefaultSvcOutStreaming](#) (in unsigned short BoardNr, in boolean - StreamingState) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Set the board default output service streaming state.
- boolean [DCM::DeviceControl::GetDefaultSvcOutStreaming](#) (in unsigned short BoardNr) raises (-Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get board default output service streaming state.
- [IPS_Out_ServiceComponents_List_t](#) [DCM::DeviceControl::IPS_OutSvcGetPIDsL](#) (in [IPS_RefTS_t](#) RefTS, in [ServiceIdList_t](#) OutputSidList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get a list of service components for services on given port and TS.
- [IPS_Out_ServiceComponents_List_V2_t](#) [DCM::DeviceControl::IPS_OutSvcGetPIDsL_V2](#) (in [IPS_RefTS_t](#) RefTS, in [ServiceIdList_t](#) OutputSidList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get a list of service components for services on given port and TS.
- [IPS_In_ServiceComponents_List_t](#) [DCM::DeviceControl::IPS_InSvcGetPIDsL](#) (in [IPS_RefTS_t](#) - RefTS, in [ServiceIdList_t](#) InputSidList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get a list of service components for services on given port and TS.

- void [DCM::DeviceControl::IPS_PassBlockPids](#) (in IPS_RefTS_t RefTS, in ServicePIDStatus_List_t ServicePIDStatusList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Block or unblock pids in a list of services on an output TS.

- void [DCM::DeviceControl::SetSI_Generation](#) (in IPS_RefTS_t OutRefTS, in TableGenerationDataList_t TableSettings) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

Change the automatic regeneration of a certain SI table so that it can be passed transparently or "alternatively" regenerated from a non-default input or from local disk (table imported over ethernet).

- void [DCM::DeviceControl::GetSI_Generation](#) (in IPS_RefTS_t OutRefTS, out TableGenerationDataList_t TableSettings) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

(Deprecated) Returns a list of all output table settings.

- void [DCM::DeviceControl::GetSI_Generation_V2](#) (in IPS_RefTS_t OutRefTS, out TableGenerationDataList_V2_t TableSettings) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Returns a list of all output table settings.

- void [DCM::DeviceControl::GetDefaultCompTrackRuleL](#) (in unsigned short BoardNr, in LongStream RuleIds, out DefaultTrackRuleList_t theList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get a (filtered) set of default component tracking rules for given TS.

- void [DCM::DeviceControl::SetDefaultCompTrackRuleL](#) (in unsigned short BoardNr, in DefaultTrackRuleList_t theList, in LongStream IDsofRulesToDelete) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Update set of default component tracking rules for given board.

- void [DCM::DeviceControl::IPS_OutGetComponentTrackRuleL](#) (in IPS_RefTS_t OutRefTS, out ComponentTrackRuleList_t theList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the current set of component tracking rules for given TS.

- void [DCM::DeviceControl::IPS_OutGetCompTrackRuleL_Filt](#) (in IPS_RefTS_t OutRefTS, in LongStream RuleIds, out ComponentTrackRuleList_t theList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get a filtered set of component tracking rules for given TS.

- void [DCM::DeviceControl::IPS_OutSetComponentTrackRuleL](#) (in IPS_RefTS_t OutRefTS, in ComponentTrackRuleList_t theList, in LongStream IDsofRulesToDelete) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Update set of component tracking rules for given TS.

- void [DCM::DeviceControl::IPS_OutGetComponentTrackRuleL_V2](#) (in IPS_RefTS_t OutRefTS, out ComponentTrackRuleList_V2_t theList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the current set of component tracking rules for given TS.

- void [DCM::DeviceControl::IPS_OutGetCompTrackRuleL_Filt_V2](#) (in IPS_RefTS_t OutRefTS, in LongStream RuleIds, out ComponentTrackRuleList_V2_t theList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get a filtered set of component tracking rules for given TS.

- void [DCM::DeviceControl::IPS_OutSetComponentTrackRuleL_V2](#) (in IPS_RefTS_t OutRefTS, in ComponentTrackRuleList_V2_t theList, in LongStream IDsofRulesToDelete) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Update set of component tracking rules for given TS.

- void [DCM::DeviceControl::IPS_ServiceCompSettingsGetL](#) (in IPS_RefTS_t RefTS, out ServiceCompSettingsList_t ServiceCompSettingsList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the list of service component settings for given TS.

- void [DCM::DeviceControl::IPS_OutSvcGetComponentTagL](#) (in IPS_RefTS_t RefTS, out ComponentTagList_t ComponentTagList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the list of components (pids) and their tag.

- void [DCM::DeviceControl::OutService_AddESFromPidL](#) (in IPS_RefTS_t RefTS, in CompPidESList_t CompPidESList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Add a list of pid components to output service(s).

- void [DCM::DeviceControl::OutService_DeleteESFromPidL](#) (in IPS_RefTS_t RefTS, in CompPidESList_t CompPidESList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Delete a list of pid components from output service(s).

- void [DCM::DeviceControl::OutService_GetESFromPidL](#) (in IPS_RefTS_t RefTS, out CompPidESList_t CompPidESList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get a list of pid components from output service(s).

- void [DCM::DeviceControl::OutService_AddESFromPidL_V2](#) (in IPS_RefTS_t RefTS, in CompPidESList_V2_t CompPidESList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Add a list of pid components to output service(s) V2.

- void [DCM::DeviceControl::OutService_DeleteESFromPidL_V2](#) (in IPS_RefTS_t RefTS, in CompPidESList_V2_t CompPidESList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Delete a list of pid components from output service(s) V2.

- void [DCM::DeviceControl::OutService_GetESFromPidL_V2](#) (in IPS_RefTS_t RefTS, out CompPidESList_V2_t CompPidESList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get a list of pid components from output service(s) V2.

- void [DCM::DeviceControl::SetES_TypeRules](#) (in IPS_RefTS_t RefTS, in SvcOutES_TypeSettingList_t SvcOutES_TypeSettingList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the ES type for a number of output PIDs for a number of services.

- SvcOutES_TypeSettingList_t [DCM::DeviceControl::GetES_TypeRules](#) (in IPS_RefTS_t RefTS, in ServiceIdList_t OutputSidList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Retrieves the ES type settings for a list of services.

- void [DCM::DeviceControl::SetPcrPids](#) (in IPS_RefSvc_t ServiceOut, in PcrSettingList_t PcrSettings) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Sets the PCR PID for a (virtual) output service.

- PcrSettingList_t [DCM::DeviceControl::GetPcrPids](#) (in IPS_RefSvc_t ServiceOut, in AlternateSrcIdList_t AlternateSrcIdList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the PCR PID settings from a (virtual) output service.

Variables

- const unsigned short [DCM::DeviceControl::INVALID_PID_VALUE](#) = 0xffff

Undefined pid.

- const unsigned short [DCM::DeviceControl::ANY_PID_VALUE](#) = 0xffff

Only for input parameters.

8.10.1 Detailed Description

This contains types, enums and methods to configure the pid settings of the multiplexer part in the device.

8.10.2 Typedef Documentation

8.10.2.1 typedef sequence<ComponentTag_t> DCM::DeviceControl::ComponentTagList_t

A sequence of [ComponentTag_t](#).

Definition at line 5768 of file DCM.idl.

8.10.2.2 typedef sequence<ComponentTrackRule_t> DCM::DeviceControl::ComponentTrackRuleList_t

A sequence of [ComponentTrackRule_t](#).

Definition at line 5805 of file DCM.idl.

8.10.2.3 typedef sequence<ComponentTrackRule_V2_t> DCM::DeviceControl::ComponentTrackRuleList_V2_t

A sequence of [ComponentTrackRule_V2_t](#).

Definition at line 5817 of file DCM.idl.

8.10.2.4 typedef sequence<DefaultTrackRule_t> DCM::DeviceControl::DefaultTrackRuleList_t

A sequence of [DefaultTrackRule_t](#).

Definition at line 5845 of file DCM.idl.

8.10.2.5 typedef sequence<ES_TypeSetting_t> DCM::DeviceControl::ES_TypeSettingList_t

Definition at line 5853 of file DCM.idl.

8.10.2.6 typedef sequence<IPS_In_ECMSettings_t> DCM::DeviceControl::IPS_In_ECMSettingsTree_t

A sequence of [IPS_In_ECMSettings_t](#).

Definition at line 5991 of file DCM.idl.

8.10.2.7 typedef sequence<IPS_In_ESSettings_t> DCM::DeviceControl::IPS_In_ESSettingsTree_t

A sequence of [IPS_In_ESSettings_t](#).

Definition at line 6010 of file DCM.idl.

8.10.2.8 typedef sequence<IPS_In_ServiceComponents_t> DCM::DeviceControl::IPS_In_ServiceComponents_List_t

A sequence of [IPS_In_ServiceComponents_t](#).

Definition at line 6023 of file DCM.idl.

8.10.2.9 `typedef sequence<IPS_Out_ECMSettings_t> DCM::DeviceControl::IPS_Out_ECMSettings-Tree_t`

A sequence of [IPS_Out_ECMSettings_t](#).

Definition at line 5918 of file DCM.idl.

8.10.2.10 `typedef sequence<IPS_Out_ESSettings_t> DCM::DeviceControl::IPS_Out_ESSettingsTree_t`

A sequence of [IPS_Out_ESSettings_t](#).

Definition at line 5930 of file DCM.idl.

8.10.2.11 `typedef sequence<IPS_Out_ESSettings_V2_t> DCM::DeviceControl::IPS_Out_ESSettings-Tree_V2_t`

A sequence of [IPS_Out_ESSettings_V2_t](#).

Definition at line 5959 of file DCM.idl.

8.10.2.12 `typedef sequence<IPS_Out_ServiceComponents_t> DCM::DeviceControl::IPS_Out_ServiceComponents_List_t`

A sequence of [IPS_Out_ServiceComponents_t](#).

Intermediate structure definition for V6.9/V7.0. Will still be changed in V7.1 where output language list will be added.

Definition at line 5945 of file DCM.idl.

8.10.2.13 `typedef sequence<IPS_Out_ServiceComponents_V2_t> DCM::DeviceControl::IPS_Out_ServiceComponents_List_V2_t`

A sequence of [IPS_Out_ServiceComponents_V2_t](#).

Definition at line 5972 of file DCM.idl.

8.10.2.14 `typedef sequence<IPS_LanguageSettings_t> DCM::DeviceControl::LanguageList_t`

A sequence of [IPS_LanguageSettings_t](#).

Definition at line 5881 of file DCM.idl.

8.10.2.15 `typedef sequence<PcrSetting_t> DCM::DeviceControl::PcrSettingList_t`

Definition at line 5982 of file DCM.idl.

8.10.2.16 `typedef sequence<ServiceCompSettings_t> DCM::DeviceControl::ServiceCompSettings-List_t`

A sequence of [ServiceCompSettings_t](#).

Definition at line 5757 of file DCM.idl.

8.10.2.17 `typedef sequence<ServiceES_t> DCM::DeviceControl::ServiceES_List_t`

A sequence of [ServiceES_t](#).

Definition at line 5872 of file DCM.idl.

8.10.2.18 `typedef sequence<ServicePIDStatus_t> DCM::DeviceControl::ServicePIDStatus_List_t`

A sequence of [ServicePIDStatus_t](#).

Definition at line 5738 of file DCM.idl.

8.10.2.19 `typedef sequence< SvcOutES_TypeSetting_t> DCM::DeviceControl::SvcOutES_TypeSettingList_t`

Definition at line 5861 of file DCM.idl.

8.10.2.20 `typedef sequence< SvcOutStreamingSetting_t> DCM::DeviceControl::SvcOutStreamingSettingList_t`

A sequence of [SvcStreamingState_t](#).

Definition at line 6076 of file DCM.idl.

8.10.2.21 `typedef sequence<TableGenerationData_t> DCM::DeviceControl::TableGenerationDataList_t`

A sequence of [TableGenerationData_t](#).

Definition at line 6045 of file DCM.idl.

8.10.2.22 `typedef sequence<TableGenerationData_V2_t> DCM::DeviceControl::TableGenerationDataList_V2_t`

A sequence of [TableGenerationData_t](#).

Definition at line 6067 of file DCM.idl.

8.10.3 Enumeration Type Documentation

8.10.3.1 `enum DCM::DeviceControl::enuDefaultRuleSetting`

What the intention of a rule can be.

Enumerator:

eDefaultRuleBlock

eDefaultRuleForce

eDefaultRulePass

Definition at line 5820 of file DCM.idl.

8.10.3.2 `enum DCM::DeviceControl::enuRuleSetting`

What the intention of a rule can be.

Enumerator:

eRuleBlock

eRuleForce

eRulePass Supported since v5.1.

Definition at line 5782 of file DCM.idl.

8.10.3.3 enum DCM::DeviceControl::enuTrackType

What information of a PID we're tracking.

Enumerator:

eTrackComponentTag

eTrackPcr

eTrackStreamType

eTrackEsPid m_usInputPid <> INVALID_PID_VALUE, m_usInputECM_PID == INVALID_PID_VALUE.

eTrackEcmPid m_usInputECM_PID <> INVALID_PID_VALUE, m_usInputPid == INVALID_PID_VALUE.

eTrackEsEcmPid m_usInputECM_PID <> INVALID_PID_VALUE, m_usInputPid <> INVALID_PID_VALUE.

Definition at line 5771 of file DCM.idl.

8.10.4 Function Documentation

8.10.4.1 void DCM::DeviceControl::GetDefaultCompTrackRuleL (in unsigned short *BoardNr*, in LongStream *RuleIds*, out DefaultTrackRuleList_t *theList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get a (filtered) set of default component tracking rules for given TS.

Parameters

in	<i>BoardNr</i>	The slot.
in	<i>RuleIds</i>	The IDs of the rules to get or an empty list for all rules.
out	<i>theList</i>	of current rules.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case of invalid reference (OutRefTS).

Remarks

There's no validity check on the filter list, ID's that don't exist will simply not be found.

8.10.4.2 boolean DCM::DeviceControl::GetDefaultSvcOutStreaming (in unsigned short *BoardNr*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get board default output service streaming state.

Parameters

in	<i>BoardNr</i>	The board the default is requested of.
----	----------------	--

Returns

boolean The default service streaming state setting.

Exceptions

<i>OpNotSupported</i>	when BoardNr = 0 = Main board.
-----------------------	--------------------------------

Version

Release 7.0

8.10.4.3 `SvcOutES_TypeSettingList_t DCM::DeviceControl::GetES_TypeRules ( in IPS_RefTS_t RefTS, in ServiceIdList_t OutputSidList )` raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Retrieves the ES type settings for a list of services.

Parameters

in	<i>RefTS</i>	specifies the TS where we want to get the ES type settings from.
in	<i>OutputSidList</i>	: list of output service ids for which the ES type settings should be returned.

Returns

SvcOutES_TypeSettingList_t : List of [SvcOutES_TypeSetting_t](#) entries

Exceptions

<i>OpNotSupported</i>	When called for other boards than IO ones (Main,...).
<i>OpNotSucceeded</i>	In case of Invalid references (RefTS)

Version

Release 6.9

8.10.4.4 `PcrSettingList_t DCM::DeviceControl::GetPcrPids ( in IPS_RefSvc_t ServiceOut, in AlternateSrcIdList_t AlternateSrcIdList )` raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the PCR PID settings from a (virtual) output service.

Parameters

in	<i>ServiceOut</i>	Identifies the output service to get the PCR settings from.
in	<i>AlternateSrcIdList</i>	The IDs of the alternate sources for which settings are requested. If empty, then the settings of all alternate services for the output service are returned

Returns

List [PcrSetting_t](#) of entries

Exceptions

<i>OpNotSupported</i>	When called for other boards than IO ones (Main,...).
<i>OpNotSucceeded</i>	In case of - Invalid references (IPS_RefSvc_t) - Invalid alternate source id (AlternateSrcIdList_t)

Version

Release 7.5

8.10.4.5 void DCM::DeviceControl::GetSI_Generation (in IPS_RefTS_t *OutRefTS*, out TableGenerationDataList_t *TableSettings*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

(Deprecated) Returns a list of all output table settings.

This list is filtered: It contains only tables which have a mode that is compatible with the old version of the PID status enum. For backwards compatibility only.

Parameters

in	<i>OutRefTS</i>	Slot, Port and Index identifying the output TS
out	<i>TableSettings,:</i>	list of output table settings

Returns

Requested table settings.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case of invalid reference (<i>OutRefTS</i>)

Deprecated

8.10.4.6 void DCM::DeviceControl::GetSI_Generation_V2 (in IPS_RefTS_t *OutRefTS*, out TableGenerationDataList_V2_t *TableSettings*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Returns a list of all output table settings.

Parameters

in	<i>OutRefTS</i>	Slot, Port and Index identifying the output TS
out	<i>TableSettings,:</i>	list of output table settings

Returns

Requested table settings.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case of invalid reference (OutRefTS)

8.10.4.7 SvcOutStreamingSettingList_t DCM::DeviceControl::GetSvcOutStreaming (in IPS_RefTS_t RefTs, in ServiceIdList_t SidList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get Output Service streaming state.

Parameters

in	<i>RefTs</i>	The Output TS the services are attached to.
in	<i>SidList</i>	List of Services to return the service streaming settings of.

Returns

SvcOutStreamingSettingList_t

Exceptions

<i>OpNotSupported</i>	when BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case the • RefTs not valid or does not exist. • no ServiceId's found for in the TS.

Version

Release 7.0

8.10.4.8 IPS_In_ServiceComponents_List_t DCM::DeviceControl::IPS_InSvcGetPIDsL (in IPS_RefTS_t RefTs, in ServiceIdList_t InputSidList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get a list of service components for services on given port and TS.

Parameters

in	<i>RefTs,</i>	The port and TS MUST exist and must be for input.
in	<i>InputSidList</i>	List of services for which to return PID info. An Empty list means all services.

Returns

A IPS_In_ServiceComponents_List_t list of [IPS_In_ServiceComponents_t](#) entries.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case invalid references are used (RefTS, InputSidList).

8.10.4.9 void DCM::DeviceControl::IPS_OutGetComponentTrackRuleL (in IPS_RefTS_t *OutRefTS*, out ComponentTrackRuleList_t *theList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the current set of component tracking rules for given TS.

Parameters

in	<i>OutRefTS</i>	The TS.
out	<i>theList</i>	of current rules.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case of invalid reference (OutRefTS).

8.10.4.10 void DCM::DeviceControl::IPS_OutGetComponentTrackRuleL_V2 (in IPS_RefTS_t *OutRefTS*, out ComponentTrackRuleList_V2_t *theList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the current set of component tracking rules for given TS.

Parameters

in	<i>OutRefTS</i>	The TS.
out	<i>theList</i>	of current rules.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case of invalid reference (OutRefTS).

Version

Release 7.3

8.10.4.11 void DCM::DeviceControl::IPS_OutGetCompTrackRuleL_Filt (in IPS_RefTS_t *OutRefTS*, in LongStream *RuleIds*, out ComponentTrackRuleList_t *theList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get a filtered set of component tracking rules for given TS.

Parameters

in	<i>OutRefTS</i>	The TS.
in	<i>RuleIds</i>	The IDs of the rules to get or an empty list for all rules.
out	<i>theList</i>	of current rules.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case of invalid reference (OutRefTS).

Remarks

There's no validity check on the filter list, ID's that don't exist will simply not be found.

8.10.4.12 void DCM::DeviceControl::IPS_OutGetCompTrackRuleL_Filt_V2 (in IPS_RefTS_t *OutRefTS*, in LongStream *RuleIds*, out ComponentTrackRuleList_V2_t *theList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get a filtered set of component tracking rules for given TS.

Parameters

in	<i>OutRefTS</i>	The TS.
in	<i>RuleIds</i>	The IDs of the rules to get or an empty list for all rules.
out	<i>theList</i>	of current rules.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case of invalid reference (OutRefTS).

Remarks

There's no validity check on the filter list, ID's that don't exist will simply not be found.

Version

Release 7.3

8.10.4.13 void DCM::DeviceControl::IPS_OutSetComponentTrackRuleL (in IPS_RefTS_t *OutRefTS*, in ComponentTrackRuleList_t *theList*, in LongStream *IDsOfRulesToDelete*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Update set of component tracking rules for given TS.

Parameters

in	<i>OutRefTS</i>	The TS.
in	<i>theList</i>	The rules to apply (new rules have ID==0 existing rules don't).
in	<i>IDsOfRulesToDelete</i>	The ID's of the rules to drop.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case of • Invalid reference (OutRefTS). • Inconsistent rules (either in the list supplied or in combination with the current settings of the device). • If ruleID <> 0 but rule does not exist. (modification of existing rule). • New rule for a perfect match (PCR, ES, ECM or ES ECM) that already has a rule. • Service ID to apply rule to not found. • Tracking type, rule setting, pid value out of range. • Streamtype tracking combined with both a language and a descriptor tag. • Trying to apply the same rule twice. • Trying to force two components with the same tracking type to the same output PID. • Trying to force or block the same component twice (PCR, Tag, Streamtype, ES, ECM). • Trying to force AND block the same component. • Trying to force two ES ECM's under the same ES Pid to the same preferred output pid. • Trying to block an ES ECM under an ES PID that is blocked.

8.10.4.14 void DCM::DeviceControl::IPS_OutSetComponentTrackRuleL_V2 (in IPS_RefTS_t *OutRefTS*, in ComponentTrackRuleList_V2_t *theList*, in LongStream *IDsOfRulesToDelete*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Update set of component tracking rules for given TS.

Parameters

in	<i>OutRefTS</i>	The TS.
in	<i>theList</i>	The rules to apply (new rules have ID==0 existing rules don't).
in	<i>IDsOfRulesToDelete</i>	The ID's of the rules to drop.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case of • Invalid reference (OutRefTS). • Inconsistent rules (either in the list supplied or in combination with the current settings of the device). • If ruleID <> 0 but rule does not exist. (modification of existing rule). • New rule for a perfect match (PCR, ES, ECM or ES ECM) that already has a rule. • Service ID to apply rule to not found. • Tracking type, rule setting, pid value out of range. • Streamtype tracking combined with both a language and a descriptor tag. • Trying to apply the same rule twice. • Trying to force two components with the same tracking type to the same output PID. • Trying to force or block the same component twice (PCR, Tag, Streamtype, ES, ECM). • Trying to force AND block the same component. • Trying to force two ES ECM's under the same ES Pid to the same preferred output pid. • Trying to block an ES ECM under an ES PID that is blocked.

Version

Release 7.3

8.10.4.15 void DCM::DeviceControl::IPS_OutSvcGetComponentTagL (in IPS_RefTS_t *RefTS*, out ComponentTagList_t *ComponentTagList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the list of components (pids) and their tag.

Parameters

in	<i>RefTS</i>	The TS.
out	<i>Component-TagList</i>	The list of tags.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case of invalid reference (RefTS).

Note

For now, only components having a tag are returned (descriptor Type == LB_STREAM_IDENTIFIER_DESCRIPTOR).

8.10.4.16 `IPS_Out_ServiceComponents_List_t DCM::DeviceControl::IPS_OutSvcGetPIDsL ( in IPS_RefTS_t RefTS, in ServiceIdList_t OutputSidList )` raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get a list of service components for services on given port and TS.

Parameters

in	<i>RefTS</i> ,:	The port and TS MUST exist and must be for output.
in	<i>OutputSidList</i>	List of services for which to return PID info. An empty list means all services.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case invalid references are used (<i>RefTS</i> , <i>OutputSidList</i>).

8.10.4.17 `IPS_Out_ServiceComponents_List_V2_t DCM::DeviceControl::IPS_OutSvcGetPIDsL_V2 ( in IPS_RefTS_t RefTS, in ServiceIdList_t OutputSidList )` raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get a list of service components for services on given port and TS.

Parameters

in	<i>RefTS</i> ,:	The port and TS MUST exist and must be for output.
in	<i>OutputSidList</i>	List of services for which to return PID info. An empty list means all services.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case invalid references are used (<i>RefTS</i> , <i>OutputSidList</i>).

8.10.4.18 `void DCM::DeviceControl::IPS_PassBlockPids ( in IPS_RefTS_t RefTS, in ServicePIDStatus_List_t ServicePIDStatusList )` raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Block or unblock pids in a list of services on an output TS.

Parameters

in	<i>RefTS</i>	A BoardNr, PortNr and Ref specifying the TS.
in	<i>ServicePID-StatusList</i>	A list of references to specific service PIDs together with pass or block status

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case an invalid TS reference is used, when the new status is not in the range (e-PID_StatusBlockedByUser, ePID_StatusPassed) or when a PID can not be found.

8.10.4.19 void DCM::DeviceControl::IPS_ServiceCompSettingsGetL (in IPS_RefTS_t *RefTS*, out ServiceCompSettingsList_t *ServiceCompSettingsList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the list of service component settings for given TS.

Parameters

in	<i>RefTS</i>	The TS.
out	<i>ServiceCompSettingsList</i>	The list of current settings.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case of invalid reference (RefTS).

8.10.4.20 void DCM::DeviceControl::OutService_AddESFromPidL (in IPS_RefTS_t *RefTS*, in CompPidESList_t *CompPidESList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Add a list of pid components to output service(s).

Parameters

in	<i>RefTS</i>	A BoardNr, PortNr and Ref specifying the output TS to add components to.
in	<i>CompPidESList</i>	A list of components to add specifying input BoardNr, PortNr, Ref, PID and output SID and output streamtype.

Exceptions

<i>OpNotSupported</i>	when RefTS BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case of - Invalid reference RefTS (BoardNr, PortNr and TS) - Non existing TS or not an output TS - Service(s) in CompPidESList don't exist

8.10.4.21 void DCM::DeviceControl::OutService_AddESFromPidL_V2 (in IPS_RefTS_t *RefTS*, in CompPidESList_V2_t *CompPidESList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Add a list of pid components to output service(s) V2.

Parameters

in	<i>RefTS</i>	A BoardNr, PortNr and Ref specifying the output TS to add components to.
in	<i>CompPidESList</i>	A list of components to add specifying input BoardNr, PortNr, Ref, PID and output SID and output streamtype.

Exceptions

<i>OpNotSupported</i>	when RefTS BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case of • Invalid reference RefTS (BoardNr, PortNr and TS) • Non existing TS or not an output TS • Service(s) in CompPidESList don't exist

Version

release 6.9

8.10.4.22 void DCM::DeviceControl::OutService_DeleteESFromPidL (in IPS_RefTS_t *RefTS*, in CompPidESList_t *CompPidESList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Delete a list of pid components from output service(s).

Parameters

in	<i>RefTS</i>	A BoardNr, PortNr and Ref specifying the output TS to delete components from.
in	<i>CompPidESList</i>	A list of components to delete specifying input BoardNr, PortNr, Ref, PID.

Exceptions

<i>OpNotSupported</i>	when RefTS BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case of • Invalid reference RefTS (BoardNr, PortNr and TS) • Non existing TS or not an output TS • Service(s) in CompPidESList don't exist

Note

CompPidES.streamtype is ignored

8.10.4.23 void DCM::DeviceControl::OutService_DeleteESFromPidL_V2 (in IPS_RefTS_t *RefTS*, in CompPidESList_V2_t *CompPidESList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Delete a list of pid components from output service(s) V2.

Parameters

in	<i>RefTS</i>	A BoardNr, PortNr and Ref specifying the output TS to delete components from.
in	<i>CompPidESList</i>	A list of components to delete specifying input BoardNr, PortNr, Ref, PID.

Exceptions

<i>OpNotSupported</i>	when RefTS BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case of • Invalid reference RefTS (BoardNr, PortNr and TS) • Non existing TS or not an output TS • Service(s) in CompPidESList don't exist

Note

CompPidES.streamtype is ignored

Version

release 6.9

8.10.4.24 void DCM::DeviceControl::OutService_GetESFromPidL (in IPS_RefTS_t *RefTS*, out CompPidESList_t *CompPidESList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get a list of pid components from output service(s).

Parameters

in	<i>RefTS</i>	A BoardNr, PortNr and Ref specifying the output TS to get components from.
out	<i>CompPidES-List</i>	

Returns

CompPidESList A list of components on the output TS service(s).

Exceptions

<i>OpNotSupported</i>	when RefTS BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case of • Invalid reference RefTS (BoardNr, PortNr and TS) • Non existing TS or not an output TS

8.10.4.25 void DCM::DeviceControl::OutService_GetESFromPidL_V2 (in IPS_RefTS_t *RefTS*, out CompPidESList_V2_t *CompPidESList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get a list of pid components from output service(s) V2.

Parameters

in	<i>RefTS</i>	A BoardNr, PortNr and Ref specifying the output TS to get components from.
out	<i>CompPidES-List</i>	

Returns

CompPidESList A list of components on the output TS service(s).

Exceptions

<i>OpNotSupported</i>	when RefTS BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case of • Invalid reference RefTS (BoardNr, PortNr and TS) • Non existing TS or not an output TS

Version

release 6.9

8.10.4.26 void DCM::DeviceControl::SetDefaultCompTrackRuleL (in unsigned short *BoardNr*, in DefaultTrackRuleList_t *theList*, in LongStream *IDsOfRulesToDelete*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Update set of default component tracking rules for given board.

Parameters

in	<i>BoardNr</i>	The slot.
in	<i>theList</i>	The rules to apply (new rules have ID==0 existing rules don't).
in	<i>IDsOfRulesToDelete</i>	The ID's of the rules to drop.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case of • Inconsistent rules (either in the list supplied or in combination with the current settings of the device). • If ruleID <> 0 but rule does not exist. (modification of existing rule). • New rule for a perfect match (PCR, ES, ECM or ES ECM) that already has a rule. • Tracking type, rule setting, pid value out of range. • Streamtype tracking combined with both a language and a descriptor tag. • Trying to apply the same rule twice. • Trying to force two components with the same tracking type to the same output PID. • Trying to force or block the same component twice (PCR, Tag, Streamtype, ES, ECM). • Trying to force AND block the same component. • Trying to force two ES ECM's under the same ES Pid to the same preferred output pid. • Trying to block an ES ECM under an ES PID that is blocked.

8.10.4.27 void DCM::DeviceControl::SetDefaultSvcOutStreaming (in unsigned short *BoardNr*, in boolean *StreamingState*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the board default output service streaming state.

Parameters

in	<i>BoardNr</i>	The Output TS the services are attached to.
in	<i>StreamingState</i>	The default service streaming state setting.

Exceptions

<i>OpNotSupported</i>	when BoardNr = 0 = Main board.
-----------------------	--------------------------------

Version

Release 7.0

8.10.4.28 void DCM::DeviceControl::SetES_TypeRules (in IPS_RefTS_t *RefTS*, in SvcOutES_TypeSettingList_t *SvcOutES_TypeSettingList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the ES type for a number of output PIDs for a number of services.

A list provided for a certain output service, replaces the previous list completely. This means when an empty list is provided for an output service any existing ES type settings for that service will be deleted. Each PID can be included only once per service.

Parameters

in	<i>RefTS</i>	specifies the output TS on which streamtypes will have to be remapped.
in	<i>SvcOutES_TypeSettingList</i>	: List of SvcOutES_TypeSetting_t entries

Exceptions

<i>OpNotSupported</i>	When called for other boards than IO ones (Main,...).
<i>OpNotSucceeded</i>	In case of - Invalid references (RefTS) - PID is not unique for a service

Version

Release 6.9

8.10.4.29 void DCM::DeviceControl::SetPcrPids (in [IPS_RefSvc_t](#) *ServiceOut*, in [PcrSettingList_t](#) *PcrSettings*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Sets the PCR PID for a (virtual) output service.

Parameters

in	<i>ServiceOut</i>	Identifies the output service where the PCR should be added.
in	<i>PcrSettings</i>	A sequence of PCR settings for number of alternate sources.

Returns**Exceptions**

<i>OpNotSupported</i>	When called for other boards than IO ones (Main,...).
<i>OpNotSucceeded</i>	In case of - Invalid references (IPS_RefSvc_t) - Invalid settings (PcrSettingList_t)

Version

Release 7.5

8.10.4.30 void DCM::DeviceControl::SetSI_Generation (in [IPS_RefTS_t](#) *OutRefTS*, in [TableGenerationDataList_t](#) *TableSettings*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

Change the automatic regeneration of a certain SI table so that it can be passed transparently or "alternatively" regenerated from a non-default input or from local disk (table imported over ethernet).

Also the output pid, on which an SI subtable should be played out, can be set.

Parameters

in	<i>OutRefTS</i>	Slot, Port and Index identifying the output TS
in	<i>TableSettings,:</i>	list of output table settings

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	when any of the following conditions occur. • Invalid references (OutRefTS, OutKeys) • One of the parameters is out of range (Outpid, ForcedOutputPid, Generation-Mode). • One of the tables to change can not be found. • Force a generated SI PID to a transparent SI PID • Force a generated SI PID to a ghost PID • Force a generated SI PID to a forced service PID • Force a transparent SI PID to a forced SI PID • Force a transparent SI PID to a transparent SI PID and input pid reference is different from output pid • Force a transparent SI PID to a ghost PID • Force a transparent SI PID to a forced service PID • Release 1.1 only allowed the regenerated mode, playout stopped and transparent mode as table generation modes.
<i>LicenseError</i>	When trying to activate EIT Filtering or Advanced EIT Filtering when insufficient licenses are available.

Note

Input table settings are ignored in release 1.1. Release 2.0 fully supports all features. Transparent is always forced even if the user specifies otherwise. The opposite goes for stopped where the force flag is always assumed to be false.

8.10.4.31 void DCM::DeviceControl::SetSvcOutStreaming (in IPS_RefTS_t *RefTs*, in SvcOutStreamingSettingList_t *SvcOutStreamingSettingList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set Output Service streaming state.

Parameters

in	<i>RefTs</i>	The Output TS the services are attached to.
in	<i>SvcOut-Streaming-SettingList</i>	List with settings to apply

Exceptions

<i>OpNotSupported</i>	when BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case of • RefTs does not exist. • an empty list is passed. • a ServiceId is not found in the TS. • a RefSvc doesn't match RefTS

Version

Release 7.0

8.10.5 Variable Documentation**8.10.5.1 const unsigned short DCM::DeviceControl::ANY_PID_VALUE = 0xffff**

Only for input parameters.

If you want to specify all pids.

Definition at line 5707 of file DCM.idl.

8.10.5.2 const unsigned short DCM::DeviceControl::INVALID_PID_VALUE = 0xffff

Undefined pid.

Definition at line 5703 of file DCM.idl.

8.11 PortConfig

This contains types, enums and methods to configure the ports of the multiplexer part in the device.

Collaboration diagram for PortConfig:

Classes

- struct `DCM::DeviceControl::AsiFormatData_t`
Structure to set ASI format and output mode.
- struct `DCM::DeviceControl::ASI_MirrorCfg_t`
Structure to define port mirroring for ASI.
- struct `DCM::DeviceControl::IpCfg_t`
- struct `DCM::DeviceControl::VlanPortSet_t`
structure to Create/Get information on Vlan PortSets
- struct `DCM::DeviceControl::ASI_BW_LimitData_t`

Typedefs

- typedef sequence< `AsiFormatData_t` > `DCM::DeviceControl::AsiFormatDataList_t`
A sequence of `AsiFormatData_t`.
- typedef sequence< `ASI_MirrorCfg_t` > `DCM::DeviceControl::ASI_MirrorCfgList_t`
A sequence of `ASI_MirrorCfg_t`.
- typedef sequence< `IpCfg_t` > `DCM::DeviceControl::IpCfgList_t`
- typedef sequence< `VlanPortSet_t` > `DCM::DeviceControl::VlanPortSetList_t`
- typedef sequence < `ASI_BW_LimitData_t` > `DCM::DeviceControl::ASI_BW_LimitDataList_t`

Enumerations

- enum `DCM::DeviceControl::eIPS_PortSelectMode` { `DCM::DeviceControl::IPS_PSM_ManualA`, `-DCM::DeviceControl::IPS_PSM_ManualB`, `DCM::DeviceControl::IPS_PSM_AutoA`, `DCM::DeviceControl::IPS_PSM_AutoB` }
- enum `DCM::DeviceControl::eIPS_PortSelectRevert` { `DCM::DeviceControl::IPS_PSR_Active`, `DCM::DeviceControl::IPS_PSR_Inactive` }
- enum `DCM::DeviceControl::ePortBackupTrigger` { `DCM::DeviceControl::PBT_LinkLoss`, `DCM::DeviceControl::PBT_LinkAndUdpLoss` }
- enum `DCM::DeviceControl::eIPS_AutoNegociation` { `DCM::DeviceControl::IPS_AN_OFF`, `DCM::DeviceControl::IPS_AN_ON` }
- enum `DCM::DeviceControl::eAsiPacketFormat` { `DCM::DeviceControl::eAsiPacketFormat204Bytes`, `DCM::DeviceControl::eAsiPacketFormat188Bytes`, `DCM::DeviceControl::eAsiPacketFormatNone` }

- enum `DCM::DeviceControl::eAsiOutputMode` { `DCM::DeviceControl::eAsiOutputModeByte`, `DCM::DeviceControl::eAsiOutputModePacket`, `DCM::DeviceControl::eAsiOutputModeNone` }
- enum `DCM::DeviceControl::ePortStreamingType` { `DCM::DeviceControl::PortStreamingType_Off`, `DCM::DeviceControl::PortStreamingType_On`, `DCM::DeviceControl::PortStreamingType_Auto` }

Enumeration of port streaming type.

Functions

- void `DCM::DeviceControl::CreateVlanPortSet` (in `VlanPortSet_t` Settings, out `IPS_Ref_t` RefVlanPortSet) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Creates a Vlan Port Set on a GbE board.
- void `DCM::DeviceControl::DeleteVlanPortSet` (in `IPS_Ref_t` RefVlanPortSet) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Delete a Vlan PortSet.
- void `DCM::DeviceControl::GetVlanPortSets` (in `IPS_Ref_t` RefPhysPortSet, out `VlanPortSetList_t` VlanPortSetList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
get all vlan portsets connect to a physical portset.
- void `DCM::DeviceControl::IPS_IP_ParamsSet` (in `IPS_Ref_t` RefPhys, in string IPAddress, in string SubNetMask, in `eIPS_AutoNegociation` AutoNeg) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Sets the IP addresses, network mask and default gateway for a GbE port.
- void `DCM::DeviceControl::IPS_IP_ParamsGet` (in `IPS_Ref_t` RefPhys, out string IPAddress, out string SubNetMask, out `eIPS_AutoNegociation` AutoNeg, out string MacAddress) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Gets the IP address, network mask and default gateway for a Gigabit ethernet output.
- void `DCM::DeviceControl::IPS_SelectModeSet` (in `IPS_Ref_t` RefPhys, in `eIPS_PortSelectMode` Mode, in `eIPS_PortSelectRevert` Revert, in unsigned long RevertDelay) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Activates a certain GigE output port.
- void `DCM::DeviceControl::IPS_SelectModeGet` (in `IPS_Ref_t` RefPhys, out `eIPS_PortSelectMode` Mode, out `eIPS_PortSelectRevert` Revert, out unsigned long RevertDelay) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Gets the active output mode status.
- unsigned long `DCM::DeviceControl::IPS_SelectedPortGet` (in `IPS_Ref_t` RefPhys) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Gets the selected port based on the SelectMode and the linkstatuses.
- void `DCM::DeviceControl::IPS_SetPortBackupTrigger` (in `IPS_Ref_t` RefPhys, in `ePortBackupTrigger` eTrigger) raises (Timeout, OpNotSucceeded, OpNotSupported)
Set the port backup trigger mode (trigger on link loss only or on link or udp loss)
- void `DCM::DeviceControl::IPS_GetPortBackupTrigger` (in `IPS_Ref_t` RefPhys, out `ePortBackupTrigger` eTrigger) raises (Timeout, OpNotSucceeded, OpNotSupported)
Gets the port backup trigger mode (trigger on link loss only or on link or udp loss)
- void `DCM::DeviceControl::IPS_SetPortMirrorMode` (in `IPS_Ref_t` RefPhys, in boolean EnablePortMirroring) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Set port mirroring on GbE ports A GbE portpair can be used in Port Mirroring mode: both main and backup ports are actively streaming and the backup port streams out an exact copy of the active port.
- void `DCM::DeviceControl::IPS_GetPortMirrorMode` (in `IPS_Ref_t` RefPhys, out boolean EnablePortMirroring) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get port mirroring status of GbE ports A GbE portpair can be used in Port Mirroring mode: both main and backup ports are actively streaming and the backup port streams out an exact copy of the active port.

- void [DCM::DeviceControl::SetAsiFormat](#) (in IPS_Ref_t RefPhys, in AsiFormatDataList_t AsiFormatList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Set the ASI format and output mode of ASI output ports.
- AsiFormatDataList_t [DCM::DeviceControl::GetAsiFormat](#) (in IPS_Ref_t RefPhys) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get the ASI format (input & output ports) and output mode of ASI output ports.
- void [DCM::DeviceControl::ASI_MirrorCfgGetL](#) (in unsigned short BoardNr, out ASI_MirrorCfgList_t MirrorCfgList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get the port mirror configuration of the ASI ports.
- void [DCM::DeviceControl::ASI_MirrorCfgSetL](#) (in unsigned short BoardNr, in ASI_MirrorCfgList_t MirrorCfgList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Set the port mirror configuration of the ASI ports.
- void [DCM::DeviceControl::InPort_ASI_BW_Limit_SetL](#) (in IPS_Ref_t RefPhys, in ASI_BW_LimitDataList_t Settings) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Enable/disable the ASI bandwidth limiting feature and set its bitrate.
- ASI_BW_LimitDataList_t [DCM::DeviceControl::InPort_ASI_BW_Limit_GetL](#) (in IPS_Ref_t RefPhys) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get the ASI bandwidth limiting data.
- void [DCM::DeviceControl::PortOutputStreamingSet](#) (in IPS_Ref_t RefPhys, in ePortStreamingType PortOutputStreaming) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Set the port output streaming setting.
- void [DCM::DeviceControl::PortOutputStreamingGet](#) (in IPS_Ref_t RefPhys, out ePortStreamingType PortOutputStreaming, out boolean bStreaming) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get the port output streaming setting.
- void [DCM::DeviceControl::SetPortPairMirror](#) (in IPS_Ref_t RefPhys, in IPS_Ref_t MirroredPort) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Set the given port pair in mirror mode.
- void [DCM::DeviceControl::GetPortPairMirror](#) (in IPS_Ref_t RefPhys, out IPS_Ref_t MirroredPort) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Returns the port pair mirror for the supplied port.

8.11.1 Detailed Description

This contains types, enums and methods to configure the ports of the multiplexer part in the device.

8.11.2 Typedef Documentation

8.11.2.1 typedef sequence<ASI_BW_LimitData_t> DCM::DeviceControl::ASI_BW_LimitDataList_t

Definition at line 6960 of file DCM.idl.

8.11.2.2 typedef sequence<ASI_MirrorCfg_t> DCM::DeviceControl::ASI_MirrorCfgList_t

A sequence of [ASI_MirrorCfg_t](#).

Definition at line 6657 of file DCM.idl.

8.11.2.3 typedef sequence<AsiFormatData_t> DCM::DeviceControl::AsiFormatDataList_t

A sequence of [AsiFormatData_t](#).

Definition at line 6645 of file DCM.idl.

8.11.2.4 typedef sequence<IpCfg_t> DCM::DeviceControl::IpCfgList_t

Definition at line 6671 of file DCM.idl.

8.11.2.5 typedef sequence<VlanPortSet_t> DCM::DeviceControl::VlanPortSetList_t

Definition at line 6723 of file DCM.idl.

8.11.3 Enumeration Type Documentation**8.11.3.1 enum DCM::DeviceControl::eAsiOutputMode****Note**

Output mode can only be set to byte mode when the output bitrate on that ASI port <= 155 Mbps.

Enumerator:

eAsiOutputModeByte

eAsiOutputModePacket

eAsiOutputModeNone Input ports don't support this.

Definition at line 6629 of file DCM.idl.

8.11.3.2 enum DCM::DeviceControl::eAsiPacketFormat**Enumerator:**

eAsiPacketFormat204Bytes

eAsiPacketFormat188Bytes

eAsiPacketFormatNone Unknown or not set.

Definition at line 6618 of file DCM.idl.

8.11.3.3 enum DCM::DeviceControl::eIPS_AutoNegociation**Enumerator:**

IPS_AN_OFF

IPS_AN_ON

Definition at line 6612 of file DCM.idl.

8.11.3.4 enum DCM::DeviceControl::eIPS_PortSelectMode**Enumerator:**

IPS_PSM_ManualA

IPS_PSM_ManualB

IPS_PSM_AutoA

IPS_PSM_AutoB

Definition at line 6592 of file DCM.idl.

8.11.3.5 enum DCM::DeviceControl::eIPS_PortSelectRevert

Enumerator:

IPS_PSR_Active

IPS_PSR_Inactive

Definition at line 6600 of file DCM.idl.

8.11.3.6 enum DCM::DeviceControl::ePortBackupTrigger

Enumerator:

PBT_LinkLoss

PBT_LinkAndUdpLoss

Definition at line 6606 of file DCM.idl.

8.11.3.7 enum DCM::DeviceControl::ePortStreamingType

Enumeration of port streaming type.

Enumerator:

PortStreamingType_Off

PortStreamingType_On

PortStreamingType_Auto

Definition at line 6660 of file DCM.idl.

8.11.4 Function Documentation

8.11.4.1 void DCM::DeviceControl::ASI_MirrorCfgGetL (in unsigned short *BoardNr*, out ASI_MirrorCfgList_t *MirrorCfgList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the port mirror configuration of the ASI ports.

Parameters

in	<i>BoardNr</i>	Specifies the BoardNr
out	<i>MirrorCfgList</i>	List of port mirror configuration

Exceptions

<i>OpNotSupported</i>	When called for non-ASI boards
-----------------------	--------------------------------

Note

- MirrorPortNr is the output port to where the data is mirrored
- MainPortNr is the corresponding source port (input or output)

8.11.4.2 void DCM::DeviceControl::ASI_MirrorCfgSetL (in unsigned short *BoardNr*, in ASI_MirrorCfgList_t *MirrorCfgList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the port mirror configuration of the ASI ports.

Parameters

in	<i>BoardNr</i>	Specifies the BoardNr
in	<i>MirrorCfgList</i>	List of port mirror configuration

Exceptions

<i>OpNotSupported</i>	When called for non-ASI boards
<i>OpNotSucceeded</i>	In case of • Invalid port specified • MirrorPortNr not unique in list

Note

- MirrorPortNr is the output port to where the data is mirrored
- MainPortNr is the corresponding source port (input or output)
- Deleting a mirror occurs when MirrorPortNr == MainPortNr

8.11.4.3 void DCM::DeviceControl::CreateVlanPortSet (in VlanPortSet_t *Settings*, out IPS_Ref_t *RefVlanPortSet*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Creates a Vlan Port Set on a GbE board.

When creating a VlanPortSet, RefVlanPortSet is ignored. The created vlan will have the same number of ports as the underlying portset, so the length of ItfAddresses must match. This means two vlan ports are created: the main one with the same [IPS_Ref_t](#) as the port set, and a backup one with a port number one higher.

Parameters

in	<i>Settings</i>	Parameters for the Vlan PortSet to create
out	<i>RefVlanPortSet</i>	Handle to the created portset.

Exceptions

<i>OpNotSupported</i>	When called for other boards than GbE ones (Main, ASI,...).
<i>OpNotSucceeded</i>	In case • RefPhysPortSet is not a physical port set • Invalid VLAN id • VLAN id already in use • Too many VLANs (current limit: 240 vlan ports = 120 vlan portsets) • bad ip address/subnet (see IPS_IP_ParamsSet)

8.11.4.4 void DCM::DeviceControl::DeleteVlanPortSet (in IPS_Ref_t RefVlanPortSet) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Delete a Vlan PortSet.

Parameters

in	RefVlanPortSet	Handle to the Vlan PortSet to destroy. No wildcard allowed
----	----------------	--

Exceptions

<i>OpNotSupported</i>	When called for other boards than GbE ones (Main, ASI,...).
<i>OpNotSucceeded</i>	In case • RefVlanPortSet is not a Vlan Port Set • bCanBeDeleted is false (vlan port set is still in use in a way that inhibits deletion, for now: IGMP join is defined on it)

8.11.4.5 AsiFormatDataList_t DCM::DeviceControl::GetAsiFormat (in IPS_Ref_t RefPhys) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the ASI format (input & output ports) and output mode of ASI output ports.

Parameters

in	RefPhys	Specifies the BoardNr & PortNr
----	---------	--------------------------------

Returns

AsiFormatDataList_t list of asi data.

Exceptions

<i>OpNotSupported</i>	When called for other boards than ASI ones (Main, GbE,...).
<i>OpNotSucceeded</i>	In case invalid references (RefPhys) are used.

Note

Format can be asked for one specific or all ASI ports (input as well as output), this by setting the PortNr to 0xFFFF.

8.11.4.6 void DCM::DeviceControl::GetPortPairMirror (in IPS_Ref_t *RefPhys*, out IPS_Ref_t *MirroredPort*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Returns the port pair mirror for the supplied port.

Parameters

in	<i>RefPhys</i>	Contains board and port number, port number should be either 0 or 2 (port numbers 0 and 1 refer to the 1st port pair, 2 and 3 to the 2nd port pair).
out	<i>MirroredPort</i>	Contains the current setting, when different from RefPhys, port pair RefPhys is mirroring MirroredPort otherwise no port pair mirroring is active.

Exceptions

<i>OpNotSupported</i>	when board nbr does not match a Gbe IO board.
<i>OpNotSucceed</i>	when supplied port number is invalid.

Version

Release 6.5

8.11.4.7 void DCM::DeviceControl::GetVlanPortSets (in IPS_Ref_t *RefPhysPortSet*, out VlanPortSetList_t *VlanPortSetList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

get all vlan portsets connect to a physical portset.

wildcard allowed for portnr.

Parameters

in	<i>RefPhysPortSet</i>	The physical portset. Wildcard allowed for portnr.
out	<i>VlanPortSetList</i>	The list of Vlan PortSets attached to the specified physial portset/board

Exceptions

<i>OpNotSupported</i>	When called for other boards than GbE ones (Main, ASI,...).
<i>OpNotSucceeded</i>	In case RefPhysPortSet is not a Physical Port Set

8.11.4.8 ASI_BW_LimitDataList_t DCM::DeviceControl::InPort_ASI_BW_Limit_GetL (in IPS_Ref_t *RefPhys*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the ASI bandwidth limiting data.

Parameters

in	<i>RefPhys</i>	Specifies the BoardNr & PortNr
----	----------------	--------------------------------

Returns

AsiFormatDataList_t list of asi data.

Exceptions

<i>OpNotSupported</i>	When called for other boards than ASI ones (Main, GbE,...).
<i>OpNotSucceeded</i>	In case invalid references (RefPhys) are used.

Note

Data can be asked for one specific port by specifying the proper PortNr or for all input ASI ports by setting the PortNr to 0xFFFF.

8.11.4.9 void DCM::DeviceControl::InPort_ASI_BW_Limit_SetL (in IPS_Ref_t *RefPhys*, in ASI_BW_LimitDataList_t *Settings*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Enable/disable the ASI bandwidth limiting feature and set its bitrate.

Parameters

in	<i>RefPhys</i>	specifies the BoardNr & PortNr.
in	<i>Settings</i>	List of ports with their according ASI Bandwidth limiting settings.

Exceptions

<i>OpNotSupported</i>	When called for other boards than ASI ones (Main, GbE,...).
<i>OpNotSucceeded</i>	In case of - Invalid references (RefPhys, Location). - BitRate out of range. - Inconsistency between RefPhys.BoardNr & Settings[x].Location.BoardNr. - Inconsistency between RefPhys.PortNr & Settings[x].Location.PortNr in case RefPhys.PortNr != 0xFFFF. - When set on a output ASI port.

8.11.4.10 void DCM::DeviceControl::IPS_GetPortBackupTrigger (in IPS_Ref_t *RefPhys*, out ePortBackupTrigger *eTrigger*) raises (TimeOut, OpNotSucceeded, OpNotSupported)

Gets the port backup trigger mode (trigger on link loss only or on link or udp loss)

Parameters

in	<i>RefPhys</i>	Specifies BoardNr & PortNr
out	<i>eTrigger</i>	

Returns

ePortBackupTrigger

Exceptions

<i>OpNotSucceeded</i>	In case of invalid references (RefPhys)
<i>OpNotSupported</i>	When called for other boards than GbE ones (Main, ASI, ...) if the GbE board is in individual port (2I2O) mode.

Returns

Trigger mode (eTrigger)

8.11.4.11 void DCM::DeviceControl::IPS_GetPortMirrorMode (in IPS_Ref_t *RefPhys*, out boolean *EnablePortMirroring*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get port mirroring status of GbE ports A GbE portpair can be used in Port Mirroring mode: both main and backup ports are actively streaming and the backup port streams out an exact copy of the active port.

Parameters

in	<i>RefPhys</i>	Identifies the (main) port. No wildcards allowed.
out	<i>EnablePortMirroring</i>	Is true in case PortMirroring is enabled. Default is false.

Exceptions

<i>OpNotSupported</i>	When the board is not a GbE board, IP Video Adapter board or IP Audio Gateway board.
<i>OpNotSucceeded</i>	In case of • RefPhys does not exist (or is a backup port). • GbE board is configured in individual port mode (2I2O).

8.11.4.12 void DCM::DeviceControl::IPS_IP_ParamsGet (in IPS_Ref_t *RefPhys*, out string *IPAddress*, out string *SubNetMask*, out eIPS_AutoNegociation *AutoNeg*, out string *MacAddress*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the IP address, network mask and default gateway for a Gigabit ethernet output.

A virtual port is possible.

Parameters

in	<i>RefPhys</i>	Specifies the Port to get the IP params from. A virtual port is possible.
out	<i>IPAddress</i>	
out	<i>SubNetMask</i>	
out	<i>AutoNeg</i>	This value is undefined for a virtual port.
out	<i>MacAddress</i>	This value is undefined for a virtual port.

Returns

IPAddress Ip address of the port.

SubNetMask SubNetMask of the port.

AutoNeg Auto negotiation of the port.

MacAddress MAC address of the port.

Exceptions

<i>OpNotSupported</i>	When called for other boards than GbE ones (Main, ASI,...).
<i>OpNotSucceeded</i>	In case invalid references are used (RefPhys).

8.11.4.13 void DCM::DeviceControl::IPS_IP_ParamsSet (in IPS_Ref_t *RefPhys*, in string *IPAddress*, in string *SubNetMask*, in eIPS_AutoNegociation *AutoNeg*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Sets the IP addresses, network mask and default gateway for a GbE port.

Parameters

in	<i>RefPhys</i>	Specifies the Port to set the IP params. A virtual port is possible.
in	<i>IPAddress</i>	Ip address of the port.
in	<i>SubNetMask</i>	SubNetMask of the port.
in	<i>AutoNeg</i>	Auto negotiation value of the port. Changing this value is undefined for a virtual port.

Exceptions

<i>OpNotSupported</i>	When called for other boards than GbE ones (Main, ASI,...).
<i>OpNotSucceeded</i>	In case - Invalid references are used (RefPhys) - Invalid enum values (AutoNeg) - Invalid netmask (should be, binary, all ones followed by all zeros) - IPAddress is in class D or class E subnet - IPAddress is in 127.x.y.z or 0.x.y.z subnet - IPAddress is already in use on the board (the same subnet is allowed though)

8.11.4.14 unsigned long DCM::DeviceControl::IPS_SelectedPortGet (in IPS_Ref_t *RefPhys*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the selected port based on the SelectMode and the linkstatuses.

Parameters

in	<i>RefPhys</i>	Specifies BoardNr & PortNr
----	----------------	----------------------------

Returns

Selected Port Resulting port number will be 1 or 2 for respective GbE1 Main, GbE2 Backup or GbE3 Main, GbE4 backup.

Exceptions

<i>OpNotSupported</i>	When called for other boards than GbE ones (Main, ASI,...).
<i>OpNotSucceeded</i>	In case - invalid references are used (RefPhys). - GbE board configured in individual port mode (2I2O).

8.11.4.15 void DCM::DeviceControl::IPS_SelectModeGet (in IPS_Ref_t *RefPhys*, out eIPS_PortSelectMode *Mode*, out eIPS_PortSelectRevert *Revert*, out unsigned long *RevertDelay*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the active output mode status.

Parameters

in	<i>RefPhys</i>	Specifies BoardNr & PortNr to get information from
out	<i>Mode</i>	
out	<i>Revert</i>	
out	<i>RevertDelay</i>	

Returns

Mode see IPS_SelectModeSet
 Revert see IPS_SelectModeSet
 RevertDelay see IPS_SelectModeSet

Exceptions

<i>OpNotSupported</i>	When called for other boards than GbE ones (Main, ASI,...).
<i>OpNotSucceeded</i>	In case - invalid references are used (RefPhys). - GbE board configured in individual port mode (2I2O).

8.11.4.16 void DCM::DeviceControl::IPS_SelectModeSet (in IPS_Ref_t *RefPhys*, in eIPS_PortSelectMode *Mode*, in eIPS_PortSelectRevert *Revert*, in unsigned long *RevertDelay*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Activates a certain GigE output port.

Parameters

in	<i>RefPhys</i>	Specifies BoardNr & PortNr.
in	<i>Mode</i>	Manually, automatically,...
in	<i>Revert</i>	If the port selection switches back to previous when a fail occurred.
in	<i>RevertDelay</i>	After which time it should revert, in seconds, 0..60.

Exceptions

<i>OpNotSupported</i>	When called for other boards than GbE ones (Main, ASI,...).
<i>OpNotSucceeded</i>	In case of - Invalid references (RefPhys) - Invalid enum values (Mode, Revert) - Out of range values (RevertDelay) - GbE board configured in individual port mode (2I2O)

Note

- It's possible to manually activate a port or let the device decide in automatic mode.
- If mode is manual, the given output port will be used as default.

8.11.4.17 void DCM::DeviceControl::IPS_SetPortBackupTrigger (in IPS_Ref_t *RefPhys*, in ePortBackupTrigger *eTrigger*) raises (TimeOut, OpNotSucceeded, OpNotSupported)

Set the port backup trigger mode (trigger on link loss only or on link or udp loss)

Parameters

in	<i>RefPhys</i>	Specifies BoardNr & PortNr
in	<i>eTrigger</i>	Trigger mode

Exceptions

<i>OpNotSucceeded</i>	In case of invalid references (RefPhys)
<i>OpNotSucceeded</i>	In case of invalid Trigger mode.
<i>OpNotSupported</i>	When called for other boards than GbE ones (Main, ASI, ...) or if the GbE board is in individual port (2I2O) mode.

8.11.4.18 void DCM::DeviceControl::IPS_SetPortMirrorMode (in IPS_Ref_t *RefPhys*, in boolean *EnablePortMirroring*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set port mirroring on GbE ports A GbE portpair can be used in Port Mirroring mode: both main and backup ports are actively streaming and the backup port streams out an exact copy of the active port.

Parameters

in	<i>RefPhys</i>	Identifies the (main) port. No wildcards allowed.
in	<i>EnablePort-Mirroring</i>	Is true in case PortMirroring is enabled. Default is false.

Exceptions

<i>OpNotSupported</i>	When the board is not a GbE board, IP Video Adapter board or IP Audio Gateway board.
<i>OpNotSucceeded</i>	In case of • RefPhys does not exist (or is a backup port). • GbE board is configured in individual port mode (2I2O).

8.11.4.19 void DCM::DeviceControl::PortOutputStreamingGet (in IPS_Ref_t *RefPhys*, out ePortStreamingType *PortOutputStreaming*, out boolean *bStreaming*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the port output streaming setting.

Parameters

in	<i>RefPhys</i>	specifies the port-pair
out	<i>PortOutput-Streaming</i>	port streaming setting
out	<i>bStreaming</i>	actual port streaming state

Exceptions

<i>OpNotSupported</i>	when called for boards other than ASI, IP Audio Gateway or IP Video Gateway.
<i>OpNotSucceeded</i>	in case of • invalid port specified • invalid port streaming setting

8.11.4.20 void DCM::DeviceControl::PortOutputStreamingSet (in IPS_Ref_t *RefPhys*, in ePortStreamingType *PortOutputStreaming*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the port output streaming setting.

Parameters

in	<i>RefPhys</i>	specifies the port-pair
in	<i>PortOutput-Streaming</i>	port streaming setting

Exceptions

<i>OpNotSupported</i>	when called for boards other than ASI, IP Audio Gateway or IP Video Gateway.
<i>OpNotSucceeded</i>	in case of • invalid port specified • invalid port streaming setting

8.11.4.21 void DCM::DeviceControl::SetAsiFormat (in IPS_Ref_t *RefPhys*, in AsiFormatDataList_t *AsiFormatList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the ASI format and output mode of ASI output ports.

Parameters

in	<i>RefPhys</i>	specifies the BoardNr & PortNr.
in	<i>AsiFormatList</i>	List of ports with their according ASI format.

Exceptions

<i>OpNotSupported</i>	When called for other boards than ASI ones (Main, GbE,...).
<i>OpNotSucceeded</i>	In case of - Invalid references (RefPhys, Location). - Invalid enum values (PacketFormat, OutputMode). - Inconsistency between RefPhys.BoardNr & AsiFormatList[x].Location.-BoardNr. - Inconsistency between RefPhys.PortNr & AsiFormatList[x].Location.PortNr in case RefPhys.PortNr != 0xFFFF. - When set on a input ASI port.

8.11.4.22 void DCM::DeviceControl::SetPortPairMirror (in IPS_Ref_t *RefPhys*, in IPS_Ref_t *MirroredPort*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the given port pair in mirror mode.

Parameters

in	<i>RefPhys</i>	Contains board and port number, port number should be either 0 or 2 (port numbers 0 and 1 refer to the 1st port pair, 2 and 3 to the 2nd port pair)
in	<i>MirroredPort</i>	When different from RefPhys, RefPhys will be mirroring MirroredPort, otherwise mirroring is disabled. Port number should be either 0 or 2.

Exceptions

<i>OpNotSupported</i>	when called for non-GBE boards
<i>OpNotSucceed</i>	- when trying to activate port pair mirroring and the other pair is already mirroring. - when supplied port number is invalid. - when RefPhys and MirroredPort are not on the same IO board.

Version

Release 6.5

8.12 8-VSB

This contains types, enums and methods to configure 8VSB ports.

Collaboration diagram for 8-VSB:

Classes

- struct [DCM::DeviceControl::InPort_8VSB_TuningParams_t](#)
Tuning parameters for an 8VSB input port.
- struct [DCM::DeviceControl::InPort_8VSB_Config_t](#)
Represents the 8VSB input port specific settings.
- struct [DCM::DeviceControl::InPort_8VSB_Statistics_t](#)
Defines the statistics that can be retrieved per 8VSB input port.

Typedefs

- typedef sequence < [InPort_8VSB_TuningParams_t](#) > [DCM::DeviceControl::InPort_8VSB_TuningParams_List_t](#)
A sequence of [InPort_8VSB_TuningParams_t](#).
- typedef sequence < [InPort_8VSB_Config_t](#) > [DCM::DeviceControl::InPort_8VSB_Config_List_t](#)
A sequence of [InPort_8VSB_Config_t](#).
- typedef sequence < [InPort_8VSB_Statistics_t](#) > [DCM::DeviceControl::InPort_8VSB_Statistics_List_t](#)
A sequence of [InPort_8VSB_Statistics_t](#).

Functions

- void [DCM::DeviceControl::InPort_8VSB_TuningParams_SetL](#) (in [IPS_Ref_t](#) RefPhys, in [InPort_8VSB_TuningParams_List_t](#) Settings) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Sets the tuning parameters for the input ports of a board.
- void [DCM::DeviceControl::InPort_8VSB_TuningParams_GetL](#) (in [IPS_Ref_t](#) RefPhys, out [InPort_8VSB_TuningParams_List_t](#) Settings) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get the tuning parameters of the given input port(s).
- void [DCM::DeviceControl::InPort_8VSB_Config_SetL](#) (in [IPS_Ref_t](#) RefPhys, in [InPort_8VSB_Config_List_t](#) Settings) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Sets 8VSB specific configuration of one or more 8VSB input ports.

- void [DCM::DeviceControl::InPort_8VSB_Config_GetL](#) (in [IPS_Ref_t](#) RefPhys, out [InPort_8VSB_Config_List_t](#) Settings) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the 8VSB specific configuration of one or more 8VSB input ports.

- void [DCM::DeviceControl::InPort_8VSB_Statistics_GetL](#) (in [IPS_Ref_t](#) RefPhys, out [InPort_8VSB_Statistics_List_t](#) Statistics) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Retrieves the statistics for one or more 8VSB input ports.

- void [DCM::DeviceControl::InPort_8VSB_Statistics_ResetL](#) (in [IPS_Ref_t](#) RefPhys, in [PortList_t](#) - Ports) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Resets the 8VSB statistics for the given 8VSB input port.

8.12.1 Detailed Description

This contains types, enums and methods to configure 8VSB ports.

8.12.2 Typedef Documentation

8.12.2.1 typedef sequence<[InPort_8VSB_Config_t](#)> [DCM::DeviceControl::InPort_8VSB_Config_List_t](#)

A sequence of [InPort_8VSB_Config_t](#).

Definition at line 7107 of file DCM.idl.

8.12.2.2 typedef sequence<[InPort_8VSB_Statistics_t](#)> [DCM::DeviceControl::InPort_8VSB_Statistics_List_t](#)

A sequence of [InPort_8VSB_Statistics_t](#).

Definition at line 7128 of file DCM.idl.

8.12.2.3 typedef sequence<[InPort_8VSB_TuningParams_t](#)> [DCM::DeviceControl::InPort_8VSB_TuningParams_List_t](#)

A sequence of [InPort_8VSB_TuningParams_t](#).

Definition at line 7090 of file DCM.idl.

8.12.3 Function Documentation

8.12.3.1 void [DCM::DeviceControl::InPort_8VSB_Config_GetL](#) (in [IPS_Ref_t](#) *RefPhys*, out [InPort_8VSB_Config_List_t](#) *Settings*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the 8VSB specific configuration of one or more 8VSB input ports.

Parameters

in	<i>RefPhys</i>	Specifies the BoardNr & PortNr
out	<i>Settings</i>	List of BW limit configuration data.

Exceptions

<i>OpNotSupported</i>	When called for boards not containing 8VSB input ports (Main, GbE,...).
<i>OpNotSucceeded</i>	In case invalid references (RefPhys) are used.

Note

Data can be asked for one specific port by specifying the proper PortNr or for all input 8VSB input ports by setting the PortNr to 0xFFFF. In the latter case the returned list will only contain 8VSB input ports, e.g. if input ports of different types are present on the board.

Version

Release 8.1

8.12.3.2 void DCM::DeviceControl::InPort_8VSB_Config_SetL (in IPS_Ref_t *RefPhys*, in InPort_8VSB_Config_List_t *Settings*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Sets 8VSB specific configuration of one or more 8VSB input ports.

Parameters

in	<i>RefPhys</i>	Boardnr and PortNr. PortNr can be 0xFFFF if more than one port is configured.
in	<i>Settings</i>	A list containing the configuration of the 8VSB port(s).

Exceptions

<i>OpNotSupported</i>	When called for a board not containing 8VSB input ports, such as main board, GbE board or ASI board.
<i>OpNotSucceeded</i>	In case of • invalid references (RefPhys, Settings[x].InputPortRef) • Inconsistency between RefPhys.BoardNr and Settings[x].Location.BoardNr. • Inconsistency between RefPhys.PortNr and Settings[x].Location.PortNr if - RefPhys.PortNr != 0xFFFF. • When set on an output port. • When set on an input port which is not an 8VSB input port.

Version

Release 8.1

8.12.3.3 void DCM::DeviceControl::InPort_8VSB_Statistics_GetL (in IPS_Ref_t *RefPhys*, out InPort_8VSB_Statistics_List_t *Statistics*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Retrieves the statistics for one or more 8VSB input ports.

Parameters

in	<i>RefPhys</i>	BoardNr and PortNr. PortNr can be 0xFFFF if more than one port is configured.
out	<i>Statistics</i>	List of statistics per 8VSB input port.

Exceptions

<i>OpNotSupported</i>	When called for boards not containing any 8VSB input ports.
<i>OpNotSucceeded</i>	In case of invalid reference (RefPhys).

Note

Data can be asked for one specific port by specifying the proper PortNr or for all input 8VSB input ports by setting the PortNr to 0xFFFF. In the latter case the returned list will only contain 8VSB input ports, e.g. if input ports of different types are present on the board.

Version

Release 8.1

8.12.3.4 void DCM::DeviceControl::InPort_8VSB_Statistics_ResetL (in IPS_Ref_t *RefPhys*, in PortList_t *Ports*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Resets the 8VSB statistics for the given 8VSB input port.

Parameters

in	<i>RefPhys</i>	Reference of the 8VSB board (PortNr is ignored)
in	<i>Ports</i>	A sequence of ports for which to reset the statistics. If an empty list is provided, the statistics of all 8VSB input ports on the board will be reset.

Exceptions

<i>OpNotSupported</i>	When called for boards not containing 8VSB ports.
<i>OpNotSucceeded</i>	In case • an invalid RefPhys is provided. • an invalid port number is provided in the Ports list. • one of the ports in the Ports list is not an 8VSB input port.

Version

Release 8.1

8.12.3.5 void DCM::DeviceControl::InPort_8VSB_TuningParams_GetL (in IPS_Ref_t *RefPhys*, out InPort_8VSB_TuningParams_List_t *Settings*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the tuning parameters of the given input port(s).

Both channel number and frequency will be filled in in the returned structures, as well as an indication of

the lock status and the (RF) input level. If the channel was selected using the frequency a negative value will be filled in as channel number in the returned settings.

Parameters

in	<i>RefPhys</i>	Specifies the BoardNr & PortNr. If PortNr is 0xFFFF the tuning parameters of all input ports supporting tuning are retrieved.
out	<i>Settings</i>	list of input port tuning parameters.

Exceptions

<i>OpNotSupported</i>	When called for boards not containing 8VSB ports (Main, GbE...).
<i>OpNotSucceeded</i>	In case invalid references (RefPhys) are used.

Note

Data can be asked for one specific port by specifying the proper PortNr or for all input ports by setting the PortNr to 0xFFFF.

Version

Release 8.1

8.12.3.6 void DCM::DeviceControl::InPort_8VSB_TuningParams_SetL (in IPS_Ref_t *RefPhys*, in InPort_8VSB_TuningParams_List_t *Settings*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Sets the tuning parameters for the input ports of a board.

Parameters

in	<i>RefPhys</i>	RefPhys specifies the BoardNr and PortNr. PortNr can be 0xFFFF if more than one port is configured.
in	<i>Settings</i>	A list of input ports with their corresponding tuning parameters.

Exceptions

<i>OpNotSupported</i>	When called for a board not containing 8VSB ports, such as main, GBE, ASI.
<i>OpNotSucceeded</i>	In case of • invalid references (RefPhys, Location) • Tuning parameters out of range • Inconsistency between RefPhys.BoardNr and Settings[x].InputPortRef.-BoardNr. • Inconsistency between RefPhys.PortNr and Settings[x].InputPortRef.PortNr if RefPhys.PortNr!=0xFFFF. • When applied to an output port.

Version

Release 8.1

8.13 DVB-S2

This contains types, enums and methods to configure DVB-S2 ports.

Collaboration diagram for DVB-S2:

Classes

- struct [DCM::DeviceControl::InPort_DvbS2_PortConfig_t](#)
Structure used to configure single stream or multi-stream mode per port.
- struct [DCM::DeviceControl::InPort_DvbS2_TunerCfg_t](#)
Structure used to configure the DVB S2 tuner.
- struct [DCM::DeviceControl::InPort_DvbS2_LncCfg_t](#)
Structure used to configure the DVB S2 LNC.
- struct [DCM::DeviceControl::InPort_DvbS2_Status_t](#)
Structure used to retrieve status information of a DVB S2 port.
- struct [DCM::DeviceControl::InPort_DvbS2_Counters_t](#)
Structure containing the different counters per DVB S2 port.
- struct [DCM::DeviceControl::DvbS2_LookupTS_t](#)
Structure to find a specific TS by port and input stream identifier.
- struct [DCM::DeviceControl::DvbS2_RefTS_t](#)
Structure containing the looked-up transport stream for a given lookupTS.
- struct [DCM::DeviceControl::DvbS2_InputTS_t](#)
DvbS2 information of an incoming DVB-S2 input stream.
- struct [DCM::DeviceControl::Debug_DvbS2_InputTS_t](#)
Information about a DVBS2 input TS, including the hardware index.

Typedefs

- typedef sequence < [InPort_DvbS2_PortConfig_t](#) > [DCM::DeviceControl::InPort_DvbS2_PortConfig_List_t](#)
A sequence of [InPort_DvbS2_PortConfig_t](#).
- typedef sequence < [InPort_DvbS2_TunerCfg_t](#) > [DCM::DeviceControl::InPort_DvbS2_TunerCfg_List_t](#)
A sequence of [InPort_DvbS2_TunerCfg_t](#).
- typedef sequence < [InPort_DvbS2_LncCfg_t](#) > [DCM::DeviceControl::InPort_DvbS2_LncCfg_List_t](#)
- typedef sequence < [InPort_DvbS2_Status_t](#) > [DCM::DeviceControl::InPort_DvbS2_Status_List_t](#)

- typedef sequence < InPort_DvbS2_Counters_t > DCM::DeviceControl::InPort_DvbS2_Counters_List_t
- typedef unsigned short DCM::DeviceControl::DvbS2_Isi_t
DVB-S2 input stream identifier type.
- typedef sequence< DvbS2_Isi_t > DCM::DeviceControl::DvbS2_Isi_list_t
A sequence of DVB-S2 input stream identifiers.
- typedef sequence < DvbS2_LookupTS_t > DCM::DeviceControl::DvbS2_LookupTS_List_t
A sequence of DvbS2_LookupTS_t.
- typedef sequence< DvbS2_RefTS_t > DCM::DeviceControl::DvbS2_RefTS_List_t
A sequence of DvbS2_RefTS_t.
- typedef sequence< DvbS2_InputTS_t > DCM::DeviceControl::DvbS2_InputTS_list_t
A sequence of DvbS2_InputTS_t.
- typedef sequence < Debug_DvbS2_InputTS_t > DCM::DeviceControl::Debug_DvbS2_InputTS_List_t
A sequence of Debug_DvbS2_InputTS_t.

Enumerations

- enum DCM::DeviceControl::eDvbS2_Mode_t { DCM::DeviceControl::eDvbS2_Mode_S, DCM::DeviceControl::eDvbS2_Mode_S2, DCM::DeviceControl::eDvbS2_Mode_Auto, DCM::DeviceControl::eDvbS2_Mode_Reserved1, DCM::DeviceControl::eDvbS2_Mode_Reserved2, DCM::DeviceControl::eDvbS2_Mode_Reserved3 }
- enum DCM::DeviceControl::eDvbS2_Polarization_t { DCM::DeviceControl::eDvbS2_Polarization_Horizontal, DCM::DeviceControl::eDvbS2_Polarization_Vertical, DCM::DeviceControl::eDvbS2_Polarization_Reserved1, DCM::DeviceControl::eDvbS2_Polarization_Reserved2, DCM::DeviceControl::eDvbS2_Polarization_Reserved3 }
- enum DCM::DeviceControl::eDvbS2_Constellation_t { DCM::DeviceControl::eDvbS2_Constellation_QPSK, DCM::DeviceControl::eDvbS2_Constellation_8PSK, DCM::DeviceControl::eDvbS2_Constellation_16APSK, DCM::DeviceControl::eDvbS2_Constellation_32APSK, DCM::DeviceControl::eDvbS2_Constellation_Reserved1, DCM::DeviceControl::eDvbS2_Constellation_Reserved2, DCM::DeviceControl::eDvbS2_Constellation_Reserved3, DCM::DeviceControl::eDvbS2_Constellation_Reserved4, DCM::DeviceControl::eDvbS2_Constellation_Reserved5 }
- enum DCM::DeviceControl::eDvbS2_LNC_Band_t { DCM::DeviceControl::eDvbS2_LNC_Band_Low, DCM::DeviceControl::eDvbS2_LNC_Band_High, DCM::DeviceControl::eDvbS2_LNC_Band_Reserved1, DCM::DeviceControl::eDvbS2_LNC_Band_Reserved2, DCM::DeviceControl::eDvbS2_LNC_Band_Reserved3 }
- enum DCM::DeviceControl::eDvbS2_SpectrumInversion_t { DCM::DeviceControl::eDvbS2_SpectrumInversion_On, DCM::DeviceControl::eDvbS2_SpectrumInversion_Off, DCM::DeviceControl::eDvbS2_SpectrumInversion_Reserved1, DCM::DeviceControl::eDvbS2_SpectrumInversion_Reserved2, DCM::DeviceControl::eDvbS2_SpectrumInversion_Reserved3 }
- enum DCM::DeviceControl::eDvbS2_FEC_CodeRate_t { DCM::DeviceControl::eDvbS2_FEC_CodeRate_1_4, DCM::DeviceControl::eDvbS2_FEC_CodeRate_1_3, DCM::DeviceControl::eDvbS2_FEC_CodeRate_2_5, DCM::DeviceControl::eDvbS2_FEC_CodeRate_1_2, DCM::DeviceControl::eDvbS2_FEC_CodeRate_3_5, DCM::DeviceControl::eDvbS2_FEC_CodeRate_2_3, DCM::DeviceControl::eDvbS2_FEC_CodeRate_3_4, DCM::DeviceControl::eDvbS2_FEC_CodeRate_4_5, DCM::DeviceControl::eDvbS2_FEC_CodeRate_5_6, DCM::DeviceControl::eDvbS2_FEC_CodeRate_7_8, DCM::DeviceControl::eDvbS2_FEC_CodeRate_8_9, DCM::DeviceControl::eDvbS2_FEC_CodeRate_9_10, DCM::DeviceControl::eDvbS2_FEC_CodeRate_Reserved1, DCM::DeviceControl::eDvbS2_FEC_CodeRate_Reserved2, DCM::DeviceControl::eDvbS2_FEC_CodeRate_Reserved3 }

- enum `DCM::DeviceControl::eDvbS2_BandSelection_t` { `DCM::DeviceControl::eDvbS2_BandSelection_Auto`, `DCM::DeviceControl::eDvbS2_BandSelection_ForcedLow`, `DCM::DeviceControl::eDvbS2_BandSelection_ForcedHigh`, `DCM::DeviceControl::eDvbS2_BandSelection_Reserved1`, `DCM::DeviceControl::eDvbS2_BandSelection_Reserved2`, `DCM::DeviceControl::eDvbS2_BandSelection_Reserved3` }
- enum `DCM::DeviceControl::eDvbS2_LncType_t` { `DCM::DeviceControl::eDvbS2_LncType_SingleBand`, `DCM::DeviceControl::eDvbS2_LncType_DualBand`, `DCM::DeviceControl::eDvbS2_LncType_Reserved1`, `DCM::DeviceControl::eDvbS2_LncType_Reserved2`, `DCM::DeviceControl::eDvbS2_LncType_Reserved3` }
- enum `DCM::DeviceControl::eDvbS2_RxMode_t` { `DCM::DeviceControl::eDvbS2_RxMode_SingleStream`, `DCM::DeviceControl::eDvbS2_RxMode_MultiStream`, `DCM::DeviceControl::eDvbS2_RxMode_Reserved1`, `DCM::DeviceControl::eDvbS2_RxMode_Reserved2`, `DCM::DeviceControl::eDvbS2_RxMode_Reserved3` }
- enum `DCM::DeviceControl::eDvbS2_MA_Type_t` { `DCM::DeviceControl::eDvbS2_MA_Type_CCM`, `DCM::DeviceControl::eDvbS2_MA_Type_VCM`, `DCM::DeviceControl::eDvbS2_MA_Type_ACM`, `DCM::DeviceControl::eDvbS2_MA_Type_Reserved1`, `DCM::DeviceControl::eDvbS2_MA_Type_Reserved2`, `DCM::DeviceControl::eDvbS2_MA_Type_Reserved3` }

The coding and modulation type.

Functions

- void `DCM::DeviceControl::InPort_DvbS2_RxModeSetL` (in unsigned short BoardNr, in `InPort_DvbS2_PortConfig_List_t` ConfigList) raises (Timeout, OpNotAllowed, OpNotSupported, OpNotSucceeded, LicenseError)
Configures the reception mode on one or more DVB S2 ports.
- void `DCM::DeviceControl::InPort_DvbS2_RxModeGetL` (in `IPS_Ref_t` RefPhys, out `InPort_DvbS2_PortConfig_List_t` ConfigList) raises (Timeout, OpNotAllowed, OpNotSupported, OpNotSucceeded)
Retrieves the reception mode of one or all DVB S2 ports.
- void `DCM::DeviceControl::InPort_DvbS2_TunerCfgSetL` (in unsigned short BoardNr, in `InPort_DvbS2_TunerCfg_List_t` Settings) raises (Timeout, OpNotAllowed, OpNotSupported, OpNotSucceeded)
Configure tuner parameters for one or more DVB S2 ports.
- void `DCM::DeviceControl::InPort_DvbS2_TunerCfgGetL` (in `IPS_Ref_t` RefPhys, out `InPort_DvbS2_TunerCfg_List_t` Settings) raises (Timeout, OpNotAllowed, OpNotSupported, OpNotSucceeded)
Retrieve the tuner parameters for one or all DVB S2 ports.
- void `DCM::DeviceControl::InPort_DvbS2_LncCfgSetL` (in unsigned short BoardNr, in `InPort_DvbS2_LncCfg_List_t` Settings) raises (Timeout, OpNotAllowed, OpNotSupported, OpNotSucceeded)
Configure LNC parameters for one or more DVB S2 ports.
- void `DCM::DeviceControl::InPort_DvbS2_LncCfgGetL` (in `IPS_Ref_t` RefPhys, out `InPort_DvbS2_LncCfg_List_t` Settings) raises (Timeout, OpNotAllowed, OpNotSupported, OpNotSucceeded)
Retrieve the LNC parameters for one or all DVB S2 ports.
- void `DCM::DeviceControl::InPort_DvbS2_StatusGetL` (in `IPS_Ref_t` RefPhys, out `InPort_DvbS2_Status_List_t` StatusList) raises (Timeout, OpNotAllowed, OpNotSupported, OpNotSucceeded)
Retrieve the status of one or all DVB S2 ports.
- void `DCM::DeviceControl::InPort_DvbS2_CountersGetL` (in `IPS_Ref_t` RefPhys, out `InPort_DvbS2_Counters_List_t` CounterList) raises (Timeout, OpNotAllowed, OpNotSupported, OpNotSucceeded)

Retrieve the counters of one or all DVB S2 ports.

- void [DCM::DeviceControl::InPort_DvbS2_CountersResetL](#) (in unsigned short BoardNr, in PortList_t Ports) raises (TimeOut, OpNotAllowed, OpNotSupported, OpNotSucceeded)

Reset the counters of one or more DVB S2 ports.

- DvbS2_RefTS_List_t [DCM::DeviceControl::DvbS2_LookupTSs](#) (in unsigned short BoardNumber, in DvbS2_LookupTS_List_t LookupList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the transport stream references for a number of transport streams with given input stream identifier.

- DvbS2_RefTS_List_t [DCM::DeviceControl::DvbS2_FindTSs](#) (in unsigned short BoardNumber, in DvbS2_LookupTS_List_t LookupList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the TS reference for a number of transport streams with given input stream identifier.

- void [DCM::DeviceControl::DvbS2_IsiGetL](#) (in IPS_Ref_t RefPhys, out boolean bIsMultiStream, out DvbS2_Isi_list_t IsiList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Retrieves the list of all detected input stream identifiers on the given DVB-S2 port.

- DvbS2_InputTS_list_t [DCM::DeviceControl::DvbS2_InTS_GetL](#) (in IPS_Ref_t PhysRef, in Ref_List_t RefList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Retrieves the list of DVB-S2 input streams.

- Debug_DvbS2_InputTS_List_t [DCM::DeviceControl::DebugDvbS2StreamInGetL](#) (in IPS_Ref_t - PhysRef, in Ref_List_t RefList) raises (TimeOut, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)

Get a list of DVBS2 information of incoming transport streams, including the hardware index.

Variables

- const unsigned short [DCM::DeviceControl::INVALID_ISI](#) = 0xffff
ISI value assigned to single stream (e.g. port in single stream mode).

8.13.1 Detailed Description

This contains types, enums and methods to configure DVB-S2 ports.

8.13.2 Typedef Documentation

8.13.2.1 typedef sequence<Debug_DvbS2_InputTS_t> DCM::DeviceControl::Debug_DvbS2_InputTS_List_t

A sequence of [Debug_DvbS2_InputTS_t](#).

Definition at line 7771 of file DCM.idl.

8.13.2.2 typedef sequence<DvbS2_InputTS_t> DCM::DeviceControl::DvbS2_InputTS_list_t

A sequence of [DvbS2_InputTS_t](#).

Definition at line 7741 of file DCM.idl.

8.13.2.3 typedef sequence<DvbS2_Isi_t> DCM::DeviceControl::DvbS2_Isi_list_t

A sequence of DVB-S2 input stream identifiers.

Definition at line 7645 of file DCM.idl.

8.13.2.4 typedef unsigned short DCM::DeviceControl::DvbS2_Isi_t

DVB-S2 input stream identifier type.

Definition at line 7642 of file DCM.idl.

8.13.2.5 typedef sequence<DvbS2_LookupTS_t> DCM::DeviceControl::DvbS2_LookupTS_List_t

A sequence of [DvbS2_LookupTS_t](#).

Definition at line 7655 of file DCM.idl.

8.13.2.6 typedef sequence<DvbS2_RefTS_t> DCM::DeviceControl::DvbS2_RefTS_List_t

A sequence of [DvbS2_RefTS_t](#).

Definition at line 7666 of file DCM.idl.

8.13.2.7 typedef sequence<InPort_DvbS2_Counters_t> DCM::DeviceControl::InPort_DvbS2_Counters_List_t

Definition at line 7599 of file DCM.idl.

8.13.2.8 typedef sequence<InPort_DvbS2_LncCfg_t> DCM::DeviceControl::InPort_DvbS2_LncCfg_List_t

Definition at line 7492 of file DCM.idl.

8.13.2.9 typedef sequence<InPort_DvbS2_PortConfig_t> DCM::DeviceControl::InPort_DvbS2_PortConfig_List_t

A sequence of [InPort_DvbS2_PortConfig_t](#).

Definition at line 7391 of file DCM.idl.

8.13.2.10 typedef sequence<InPort_DvbS2_Status_t> DCM::DeviceControl::InPort_DvbS2_Status_List_t

Definition at line 7568 of file DCM.idl.

8.13.2.11 typedef sequence<InPort_DvbS2_TunerCfg_t> DCM::DeviceControl::InPort_DvbS2_TunerCfg_List_t

A sequence of [InPort_DvbS2_TunerCfg_t](#).

Definition at line 7445 of file DCM.idl.

8.13.3 Enumeration Type Documentation**8.13.3.1 enum DCM::DeviceControl::eDvbS2_BandSelection_t**

Enumerator:

eDvbS2_BandSelection_Auto default
eDvbS2_BandSelection_ForcedLow
eDvbS2_BandSelection_ForcedHigh
eDvbS2_BandSelection_Reserved1
eDvbS2_BandSelection_Reserved2

eDvbS2_BandSelection_Reserved3

Definition at line 7344 of file DCM.idl.

8.13.3.2 enum DCM::DeviceControl::eDvbS2_Constellation_t

Enumerator:

eDvbS2_Constellation_QPSK
eDvbS2_Constellation_8PSK
eDvbS2_Constellation_16APSK
eDvbS2_Constellation_32APSK
eDvbS2_Constellation_Reserved1
eDvbS2_Constellation_Reserved2
eDvbS2_Constellation_Reserved3
eDvbS2_Constellation_Reserved4
eDvbS2_Constellation_Reserved5

Definition at line 7294 of file DCM.idl.

8.13.3.3 enum DCM::DeviceControl::eDvbS2_FEC_CodeRate_t

Enumerator:

eDvbS2_FEC_CodeRate_1_4 1/4
eDvbS2_FEC_CodeRate_1_3 1/3
eDvbS2_FEC_CodeRate_2_5 2/5
eDvbS2_FEC_CodeRate_1_2 1/2
eDvbS2_FEC_CodeRate_3_5 3/5
eDvbS2_FEC_CodeRate_2_3 2/3
eDvbS2_FEC_CodeRate_3_4 3/4
eDvbS2_FEC_CodeRate_4_5 4/5
eDvbS2_FEC_CodeRate_5_6 5/6
eDvbS2_FEC_CodeRate_7_8 7/8
eDvbS2_FEC_CodeRate_8_9 8/9
eDvbS2_FEC_CodeRate_9_10 9/10
eDvbS2_FEC_CodeRate_Reserved1
eDvbS2_FEC_CodeRate_Reserved2
eDvbS2_FEC_CodeRate_Reserved3

Definition at line 7325 of file DCM.idl.

8.13.3.4 enum DCM::DeviceControl::eDvbS2_LNC_Band_t

Enumerator:

eDvbS2_LNC_Band_Low
eDvbS2_LNC_Band_High
eDvbS2_LNC_Band_Reserved1
eDvbS2_LNC_Band_Reserved2
eDvbS2_LNC_Band_Reserved3

Definition at line 7307 of file DCM.idl.

8.13.3.5 enum DCM::DeviceControl::eDvbS2_LncType_t

Enumerator:

eDvbS2_LncType_SingleBand default
eDvbS2_LncType_DualBand
eDvbS2_LncType_Reserved1
eDvbS2_LncType_Reserved2
eDvbS2_LncType_Reserved3

Definition at line 7354 of file DCM.idl.

8.13.3.6 enum DCM::DeviceControl::eDvbS2_MA_Type_t

The coding and modulation type.

Enumerator:

eDvbS2_MA_Type_CCM Constant Coding and Modulation.
eDvbS2_MA_Type_VCM Variable Coding and Modulation.
eDvbS2_MA_Type_ACM Adaptive Coding and Modulation.
eDvbS2_MA_Type_Reserved1
eDvbS2_MA_Type_Reserved2
eDvbS2_MA_Type_Reserved3

Definition at line 7373 of file DCM.idl.

8.13.3.7 enum DCM::DeviceControl::eDvbS2_Mode_t

Enumerator:

eDvbS2_Mode_S
eDvbS2_Mode_S2
eDvbS2_Mode_Auto default
eDvbS2_Mode_Reserved1
eDvbS2_Mode_Reserved2
eDvbS2_Mode_Reserved3

Definition at line 7275 of file DCM.idl.

8.13.3.8 enum DCM::DeviceControl::eDvbS2_Polarization_t

Enumerator:

eDvbS2_Polarization_Horizontal default
eDvbS2_Polarization_Vertical
eDvbS2_Polarization_Reserved1
eDvbS2_Polarization_Reserved2
eDvbS2_Polarization_Reserved3

Definition at line 7285 of file DCM.idl.

8.13.3.9 enum DCM::DeviceControl::eDvbS2_RxMode_t

Enumerator:

eDvbS2_RxMode_SingleStream single stream reception only (default)
eDvbS2_RxMode_MultiStream single or multi-stream reception
eDvbS2_RxMode_Reserved1
eDvbS2_RxMode_Reserved2
eDvbS2_RxMode_Reserved3

Definition at line 7363 of file DCM.idl.

8.13.3.10 enum DCM::DeviceControl::eDvbS2_SpectrumInversion_t

Enumerator:

eDvbS2_SpectrumInversion_On
eDvbS2_SpectrumInversion_Off
eDvbS2_SpectrumInversion_Reserved1
eDvbS2_SpectrumInversion_Reserved2
eDvbS2_SpectrumInversion_Reserved3

Definition at line 7316 of file DCM.idl.

8.13.4 Function Documentation

8.13.4.1 Debug_DvbS2_InputTS_List_t DCM::DeviceControl::DebugDvbS2StreamInGetL (in IPS_Ref_t PhysRef, in Ref_List_t RefList) raises (TimeOut, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)

Get a list of DVBS2 information of incoming transport streams, including the hardware index.

Parameters

in	<i>PhysRef</i>	The BoardNr and PortNr of which you want the information.
in	<i>RefList</i>	A Ref_List_t, sequence of Ref's (longs) you want info about.

Returns

A sequence of [Debug_DvbS2_InputTS_t](#) entries.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OperationFailed</i>	In case invalid references(PhysRef, RefList) are used.

Note

- A value of 0xFFFF for port means all ports.
- An empty RefList means all refs.
- A non-empty RefList is only allowed for a specific PhysRef (not if PhysRef has wildcard).

Version

Release 9.10

8.13.4.2 DvbS2_RefTS_List_t DCM::DeviceControl::DvbS2_FindTSs (in unsigned short *BoardNumber*, in DvbS2_LookupTS_List_t *LookupList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the TS reference for a number of transport streams with given input stream identifier.

NO automatic creation will be done in any case.

Parameters

in	<i>BoardNumber</i>	An unsigned short to indicate the slot.
in	<i>LookupList</i>	A sequence of board/port/ISI

Returns

A DvbS2_RefTS_List_t, a sequence of [DvbS2_RefTS_t](#) entries with corresponding TS reference.

Exceptions

<i>Timeout</i>	A timeout occurred during IIOP processing.
<i>OpNotAllowed</i>	not logged in.
<i>OpNotSupported</i>	When board doesn't support this operation.
<i>OpNotSucceeded</i>	- When BoardNumber or LookupList is invalid.

Version

Release 9.0

8.13.4.3 DvbS2_InputTS_list_t DCM::DeviceControl::DvbS2_InTS_GetL (in IPS_Ref_t *PhysRef*, in Ref_List_t *RefList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Retrieves the list of DVB-S2 input streams.

Parameters

in	<i>PhysRef</i>	Identifies the port. Wildcard allowed for PortNr.
in	<i>RefList</i>	Filter result with list of given TS ids. Empty list to get all.

Returns

Sequence of [DvbS2_InputTS_t](#), mapping the input stream reference to ISI.

Exceptions

<i>Timeout</i>	A timeout occurred during IIOP processing.
<i>OpNotAllowed</i>	not logged in.
<i>OpNotSupported</i>	board does not support this operation.
<i>OpNotSucceeded</i>	if invalid references are used.

Version

Release 9.0

8.13.4.4 void DCM::DeviceControl::DvbS2_IsiGetL (in IPS_Ref_t *RefPhys*, out boolean *bIsMultiStream*, out DvbS2_Isi_list_t *IsiList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Retrieves the list of all detected input stream identifiers on the given DVB-S2 port.

Parameters

in	<i>RefPhys</i>	identification of the DVB-S2 port.
out	<i>bIsMultiStream</i>	True if multistream is detected. If false <i>IsiList</i> is empty.
out	<i>IsiList</i>	list of detected input stream identifiers. This list contains all ISI's that are detected at the input (can be more than 6).

Exceptions

<i>TimeOut</i>	A timeout occurred during IIOP processing.
<i>OpNotAllowed</i>	not logged in.
<i>OpNotSupported</i>	board does not support this operation.
<i>OpNotSucceeded</i>	- invalid port reference

Version

Release 9.10

8.13.4.5 DvbS2_RefTS_List_t DCM::DeviceControl::DvbS2_LookupTSs (in unsigned short *BoardNumber*, in DvbS2_LookupTS_List_t *LookupList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the transport stream references for a number of transport streams with given input stream identifier.

If an input TS is looked up, this one will automatically be created when not found. The number of transport streams that can be created automatically is limited by the number of ISI's that can be supported on a DVB-S2 port (currently 6).

Parameters

in	<i>BoardNumber</i>	An unsigned short to indicate the slot.
in	<i>LookupList</i>	A sequence of board/port/ISI for which TS Index is to be returned.

Returns

A DvbS2_RefTS_List_t, a sequence of [DvbS2_RefTS_t](#) entries with corresponding TS reference.

Exceptions

<i>TimeOut</i>	A timeout occurred during IIOP processing.
<i>OpNotAllowed</i>	not logged in.
<i>OpNotSupported</i>	When board doesn't support this operation.

<i>OpNotSucceeded</i>	when BoardNumber or Ref is invalid. • When too many TS are looked up for a single DVB-S2 port. • When duplicate ISI's are looked up for a single DVB-S2 port.
-----------------------	--

Version

Release 9.0

8.13.4.6 void DCM::DeviceControl::InPort_DvbS2_CountersGetL (in IPS_Ref_t *RefPhys*, out InPort_DvbS2_Counters_List_t *CounterList*) raises (TimeOut, OpNotAllowed, OpNotSupported, OpNotSucceeded)

Retrieve the counters of one or all DVB S2 ports.

Parameters

in	<i>RefPhys</i>	identifies the port. If PortNr is 0xFFFF status parameters of all ports are returned.
out	<i>CounterList</i>	list of counters per port.

Exceptions

<i>TimeOut</i>	A timeout occurred during IIOP processing.
<i>OpNotAllowed</i>	not logged in.
<i>OpNotSupported</i>	when called on non-DVB S2 board.
<i>OpNotSucceeded</i>	invalid RefPhys.

Version

Release 9.10

8.13.4.7 void DCM::DeviceControl::InPort_DvbS2_CountersResetL (in unsigned short *BoardNr*, in PortList_t *Ports*) raises (TimeOut, OpNotAllowed, OpNotSupported, OpNotSucceeded)

Reset the counters of one or more DVB S2 ports.

Parameters

in	<i>BoardNr</i>	identifies the board.
in	<i>Ports</i>	list of input ports. Empty list to reset all ports.

Exceptions

<i>TimeOut</i>	A timeout occurred during IIOP processing.
<i>OpNotAllowed</i>	not logged in.
<i>OpNotSupported</i>	when called on non-DVB S2 board.
<i>OpNotSucceeded</i>	when invalid reference is used.

Version

Release 9.10

8.13.4.8 void DCM::DeviceControl::InPort_DvbS2_LncCfgGetL (in IPS_Ref_t *RefPhys*, out InPort_DvbS2_LncCfg_List_t *Settings*) raises (Timeout, OpNotAllowed, OpNotSupported, OpNotSucceeded)

Retrieve the LNC parameters for one or all DVB S2 ports.

Parameters

in	<i>RefPhys</i>	identifies the port. Wildcard allowed for PortNr.
out	<i>Settings</i>	list of input port tuning parameters.

Exceptions

<i>Timeout</i>	A timeout occurred during IIOP processing.
<i>OpNotAllowed</i>	not logged in.
<i>OpNotSupported</i>	when called on non-DVB S2 board.
<i>OpNotSucceeded</i>	when invalid reference is used.

Version

Release 9.0

8.13.4.9 void DCM::DeviceControl::InPort_DvbS2_LncCfgSetL (in unsigned short *BoardNr*, in InPort_DvbS2_LncCfg_List_t *Settings*) raises (Timeout, OpNotAllowed, OpNotSupported, OpNotSucceeded)

Configure LNC parameters for one or more DVB S2 ports.

Remark: LNC Bias can only be enabled on the first two DVB S2 ports (first front end).

Parameters

in	<i>BoardNr</i>	Identifies the board.
in	<i>Settings</i>	List of configuration data.

Exceptions

<i>Timeout</i>	A timeout occurred during IIOP processing.
<i>OpNotAllowed</i>	not logged in.
<i>OpNotSupported</i>	when called on non-DVB S2 board.
<i>OpNotSucceeded</i>	in case of invalid input parameters, references... if LNC bias is enabled on invalid ports.

Version

Release 9.0

8.13.4.10 void DCM::DeviceControl::InPort_DvbS2_RxModeGetL (in IPS_Ref_t *RefPhys*,
out InPort_DvbS2_PortConfig_List_t *ConfigList*) raises (Timeout, OpNotAllowed,
OpNotSupported, OpNotSucceeded)

Retrieves the reception mode of one or all DVB S2 ports.

Parameters

in	<i>RefPhys</i>	identifies the port (wildcard is allowed for PortNr).
out	<i>ConfigList</i>	list of configuration data.

Exceptions

<i>Timeout</i>	A timeout occurred during IIOP processing.
<i>OpNotSucceeded</i>	invalid references are used.
<i>OpNotAllowed</i>	not logged in.
<i>OpNotSupported</i>	if board does not support this function.

Version

Release 9.0

8.13.4.11 void DCM::DeviceControl::InPort_DvbS2_RxModeSetL (in unsigned short *BoardNr*,
in InPort_DvbS2_PortConfig_List_t *ConfigList*) raises (Timeout, OpNotAllowed,
OpNotSupported, OpNotSucceeded, LicenseError)

Configures the reception mode on one or more DVB S2 ports.

Parameters

in	<i>BoardNr</i>	identifies the board.
in	<i>ConfigList</i>	contains the configuration per port.

Exceptions

<i>Timeout</i>	A timeout occurred during IIOP processing.
<i>OpNotAllowed</i>	not logged in.
<i>OpNotSupported</i>	if board does not support this function.
<i>OpNotSucceeded</i>	invalid references are used.
<i>LicenseError</i>	required multistream license is not available.

Version

Release 9.0

8.13.4.12 void DCM::DeviceControl::InPort_DvbS2_StatusGetL (in IPS_Ref_t *RefPhys*, out InPort_DvbS2_Status_List_t *StatusList*) raises (Timeout, OpNotAllowed, OpNotSupported, OpNotSucceeded)

Retrieve the status of one or all DVB S2 ports.

Parameters

in	<i>RefPhys</i>	identifies the port. Wildcard allowed for PortNr.
out	<i>StatusList</i>	list of input port tuning parameters.

Exceptions

<i>Timeout</i>	A timeout occurred during IIOP processing.
<i>OpNotAllowed</i>	not logged in.
<i>OpNotSupported</i>	when called on non-DVB S2 board.
<i>OpNotSucceeded</i>	when invalid reference is used.

Version

Release 9.0

8.13.4.13 void DCM::DeviceControl::InPort_DvbS2_TunerCfgGetL (in IPS_Ref_t *RefPhys*, out InPort_DvbS2_TunerCfg_List_t *Settings*) raises (Timeout, OpNotAllowed, OpNotSupported, OpNotSucceeded)

Retrieve the tuner parameters for one or all DVB S2 ports.

Parameters

in	<i>RefPhys</i>	identifies the port. Wildcard allowed for PortNr.
out	<i>Settings</i>	list of input port tuning parameters.

Exceptions

<i>Timeout</i>	A timeout occurred during IIOP processing.
<i>OpNotAllowed</i>	not logged in.
<i>OpNotSupported</i>	when called on non-DVB S2 board.
<i>OpNotSucceeded</i>	when invalid reference is used.

Version

Release 9.0

8.13.4.14 void DCM::DeviceControl::InPort_DvbS2_TunerCfgSetL (in unsigned short *BoardNr*, in InPort_DvbS2_TunerCfg_List_t *Settings*) raises (Timeout, OpNotAllowed, OpNotSupported, OpNotSucceeded)

Configure tuner parameters for one or more DVB S2 ports.

Parameters

in	<i>BoardNr</i>	Identifies the board.
in	<i>Settings</i>	List of configuration data.

Exceptions

<i>TimeOut</i>	A timeout occurred during IIOP processing.
<i>OpNotAllowed</i>	not logged in.
<i>OpNotSupported</i>	when called on non-DVB S2 board.
<i>OpNotSucceeded</i>	in case of invalid input parameters, references...

Version

Release 9.0

8.13.5 Variable Documentation**8.13.5.1 const unsigned short DCM::DeviceControl::INVALID_ISI = 0xffff**

ISI value assigned to single stream (e.g. port in single stream mode).

Definition at line 7639 of file DCM.idl.

8.14 Descriptors

This contains types, enums and methods to configure descriptors settings of the multiplexer part in the device.

Collaboration diagram for Descriptors:

Classes

- struct [DCM::DeviceControl::TableKeysExt_t](#)
- struct [DCM::DeviceControl::DescriptorData_t](#)
- struct [DCM::DeviceControl::DescriptorRule_t](#)
- struct [DCM::DeviceControl::DescriptorRuleSet_t](#)
- struct [DCM::DeviceControl::MergedESDescriptorData_t](#)

Modules

- [Compact CA Descriptor settings](#)

This contains types, enums and methods to configure the handling of compact CA descriptors.

Typedefs

- typedef sequence< TableKeysExt_t > [DCM::DeviceControl::TableKeysExtList_t](#)
- typedef sequence< DescriptorData_t > [DCM::DeviceControl::DescriptorDataList_t](#)
- typedef sequence< DescriptorRule_t > [DCM::DeviceControl::DescriptorRuleList_t](#)
- typedef sequence< DescriptorRuleSet_t > [DCM::DeviceControl::DescriptorRuleSetList_t](#)
- typedef sequence< MergedESDescriptorData_t > [DCM::DeviceControl::MergedESDescriptorDataList_t](#)

Enumerations

- enum [DCM::DeviceControl::eDescriptorType](#) { [DCM::DeviceControl::eDT_ManuallyInserted](#), [DCM::DeviceControl::eDT_Passed](#), [DCM::DeviceControl::eDT_Generated](#), [DCM::DeviceControl::eDT_Imported](#) }

Functions

- void [DCM::DeviceControl::InsertDescriptorL](#) (in [IPS_RefTS_t](#) RefTS, in [DescriptorDataList_t](#) - [DescriptorDataList](#), in boolean Volatile) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Insert descriptors to parts of a table Imported descriptors can be uniquely identified in two ways: either by the tag and the complete descriptor bytestream stream or either by their ID.

- void [DCM::DeviceControl::DeleteDescriptorL](#) (in `IPS_RefTS_t` RefTS, in `DescriptorDataList_t` - `DescriptorDataList`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Delete Inserted descriptors This function allows deleting descriptors using a ID or using the [TableKeysExt_t](#) with masking for location.

- void [DCM::DeviceControl::OutTS_GetDescriptorL](#) (in `IPS_RefTS_t` RefTS, in `TableKeysExt_t` - `TableKey`, out `DescriptorDataList_t` `DescriptorDataList`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get ALL descriptors of a table This function can be used to see all descriptors that are available for the specified table at a certain TS.

- void [DCM::DeviceControl::OutTS_SetSpecDescrOrderRules](#) (in `IPS_RefTS_t` RefTS, in `DescriptorRuleSetList_t` `OrderRulesList`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set descriptor order rules to parts of a table Full list set and no add or remove, to allow ordering on the GUI.

- void [DCM::DeviceControl::OutTS_GetSpecDescrOrderRules](#) (in `IPS_RefTS_t` RefTS, in `TableKeysExtList_t` `TableKeyList`, out `DescriptorRuleSetList_t` `OrderRulesList`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get descriptor order rules Symmetrical with [OutTS_SetSpecDescrOrderRules](#).

- void [DCM::DeviceControl::OutTS_SetSpecDescrRemoveRules](#) (in `IPS_RefTS_t` RefTS, in `DescriptorRuleSetList_t` `RemoveRulesList`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set descriptor blocking rules to parts of a table Full list set and no add or remove, to allow ordering on the GUI.

- void [DCM::DeviceControl::OutTS_GetSpecDescrRemoveRules](#) (in `IPS_RefTS_t` RefTS, in `TableKeysExtList_t` `TableKeyList`, out `DescriptorRuleSetList_t` `RemoveRulesList`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get descriptor blocking rules Symmetrical with [OutTS_SetSpecDescrRemoveRules](#).

- void [DCM::DeviceControl::Board_SetDefDescrOrderRules](#) (in `IPS_Ref_t` PhysRef, in `DescriptorRuleSetList_t` `OrderRules`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set default descriptor order rules.

- void [DCM::DeviceControl::Board_GetDefDescrOrderRules](#) (in `IPS_Ref_t` PhysRef, out `DescriptorRuleSetList_t` `OrderRules`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get default descriptor order rules.

- void [DCM::DeviceControl::Board_SetDefDescrRemoveRules](#) (in `IPS_Ref_t` PhysRef, in `DescriptorRuleSetList_t` `RemoveRules`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set default descriptor blocking rules.

- void [DCM::DeviceControl::Board_GetDefDescrRemoveRules](#) (in `IPS_Ref_t` PhysRef, out `DescriptorRuleSetList_t` `RemoveRules`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get default descriptor blocking rules.

- void [DCM::DeviceControl::MergedES_InsertDescriptorL](#) (in `IPS_RefTS_t` RefTS, in `MergedESDescriptorDataList_t` `DescriptorDataList`, in `boolean` `volatile`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Insert descriptors to merged elementary streams Imported descriptors can be uniquely identified in two ways: either by the tag and the complete descriptor bytestream stream or either by their ID.

- void [DCM::DeviceControl::MergedES_DeleteDescriptorL](#) (in `IPS_RefTS_t` RefTS, in `MergedESDescriptorDataList_t` `DescriptorDataList`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Delete inserted descriptors from Merged ESs This function allows deleting descriptors using a ID.

- void [DCM::DeviceControl::OutTs_GetMergedES_DescriptorL](#) (in IPS_RefTS_t RefTS, in unsigned long OutputSID, out MergedESDescriptorDataList_t DescriptorDataList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get ALL Merged ES descriptors for a specific output service This function can be used to see all descriptors that are available for the specified table at a certain TS.

8.14.1 Detailed Description

This contains types, enums and methods to configure descriptors settings of the multiplexer part in the device.

8.14.2 Typedef Documentation

8.14.2.1 typedef sequence<DescriptorData_t> DCM::DeviceControl::DescriptorDataList_t

Definition at line 7834 of file DCM.idl.

8.14.2.2 typedef sequence<DescriptorRule_t> DCM::DeviceControl::DescriptorRuleList_t

Definition at line 7841 of file DCM.idl.

8.14.2.3 typedef sequence<DescriptorRuleSet_t> DCM::DeviceControl::DescriptorRuleSetList_t

Definition at line 7848 of file DCM.idl.

8.14.2.4 typedef sequence<MergedESDescriptorData_t> DCM::DeviceControl::MergedESDescriptorDataList_t

Definition at line 8034 of file DCM.idl.

8.14.2.5 typedef sequence<TableKeysExt_t> DCM::DeviceControl::TableKeysExtList_t

Definition at line 7815 of file DCM.idl.

8.14.3 Enumeration Type Documentation

8.14.3.1 enum DCM::DeviceControl::eDescriptorType

Enumerator:

eDT_ManuallyInserted typically from GUI

eDT_Passed typically from input

eDT_Generated e.g. SCS

eDT_Imported e.g. PSIG

Definition at line 7817 of file DCM.idl.

8.14.4 Function Documentation

8.14.4.1 void DCM::DeviceControl::Board_GetDefDescrOrderRules (in IPS_Ref_t *PhysRef*, out DescriptorRuleSetList_t *OrderRules*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get default descriptor order rules.

Symmetrical with Board_SetDefDescrOrderRules.

Parameters

in	<i>PhysRef</i>	specifies the board for which the rules are set. The port is ignored.
out	<i>OrderRules</i>	

Returns

OrderRules is returned

Exceptions

<i>OpNotSupported</i>	When called for other boards than IO ones (Main,...).
-----------------------	---

8.14.4.2 void DCM::DeviceControl::Board_GetDefDescrRemoveRules (in IPS_Ref_t *PhysRef*, out DescriptorRuleSetList_t *RemoveRules*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get default descriptor blocking rules.

Symmetrical with Board_SetDefDescrRemoveRules.

Parameters

in	<i>PhysRef</i>	specifies the board for which the rules are set. The port is ignored.
out	<i>RemoveRules</i>	

Returns

RemoveRules is returned

Exceptions

<i>OpNotSupported</i>	When called for other boards than IO ones (Main,...).
-----------------------	---

8.14.4.3 void DCM::DeviceControl::Board_SetDefDescrOrderRules (in IPS_Ref_t *PhysRef*, in DescriptorRuleSetList_t *OrderRules*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set default descriptor order rules.

When a new tables are created, these settings will be added to them.

Parameters

in	<i>PhysRef</i>	specifies the board for which the rules are set. The port is ignored.
in	<i>OrderRules</i>	specifies the descriptor order rules. The tablekeys part is ignored.

Exceptions

<i>OpNotSupported</i>	When called for other boards than IO ones (Main,...).
<i>OpNotSucceeded</i>	In case of • Descriptor Data larger than 255 bytes

8.14.4.4 void DCM::DeviceControl::Board_SetDefDescrRemoveRules (in IPS_Ref_t *PhysRef*, in DescriptorRuleSetList_t *RemoveRules*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set default descriptor blocking rules.

When a new tables are created, these settings will be added to them.

Parameters

in	<i>PhysRef</i>	specifies the board for which the rules are set. The port is ignored.
in	<i>RemoveRules</i>	specifies the descriptor order rules. The tablekeys part is ignored.

Exceptions

<i>OpNotSupported</i>	When called for other boards than IO ones (Main,...).
<i>OpNotSucceeded</i>	In case of • Descriptor Data larger than 255 bytes

8.14.4.5 void DCM::DeviceControl::DeleteDescriptorL (in IPS_RefTS_t *RefTS*, in DescriptorDataList_t *DescriptorDataList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Delete Inserted descriptors This function allows deleting descriptors using a ID or using the [TableKeysExt_t](#) with masking for location.

If the ID is not invalid then a delete based on ID will be performed.

Parameters

in	<i>RefTS</i>	specifies the TS on which descriptors are deleted
in	<i>DescriptorDataList</i>	specifies which inserted descriptors must be deleted

Exceptions

<i>OpNotSupported</i>	When called for other boards than IO ones (Main,...).
<i>OpNotSucceeded</i>	In case of • Invalid references (RefTS). • No Tables found

8.14.4.6 void DCM::DeviceControl::InsertDescriptorL (in IPS_RefTS_t *RefTS*, in DescriptorDataList_t *DescriptorDataList*, in boolean *Volatile*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Insert descriptors to parts of a table Imported descriptors can be uniquely identified in two ways: either by the tag and the complete descriptor bytestream stream or either by their ID.

Other descriptors (generated and passed) can only be uniquely identified using their tag and bytestream. The user can give the descriptor a name.

Parameters

in	<i>RefTS</i>	specifies the TS on which descriptors are inserted
in	<i>DescriptorDataList</i>	specifies the inserted descriptors and where they must be inserted
in	<i>Volatile</i>	specifies whether the descriptors must be saved to file

Exceptions

<i>OpNotSupported</i>	When called for other boards than IO ones (Main,...).
<i>OpNotSucceeded</i>	In case of - Invalid references (RefTS) - No Tables found - Descriptor Data larger than 255 bytes - No more free ID's (2147483646 available) - DescriptorType set to something other than eDT_ManuallyInserted

8.14.4.7 void DCM::DeviceControl::MergedES_DeleteDescriptorL (in IPS_RefTS_t *RefTS*, in MergedESDescriptorDataList_t *DescriptorDataList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Delete inserted descriptors from Merged ESs This function allows deleting descriptors using a ID.

Parameters

in	<i>RefTS</i>	specifies the TS on which descriptors are deleted
in	<i>DescriptorDataList</i>	specifies which inserted descriptors must be deleted (username, tag and bytestream parameters are ignored)

Exceptions

<i>OpNotSupported</i>	When called for other boards than IO ones (Main,...).
<i>OpNotSucceeded</i>	In case of - Invalid references (RefTS). - Merged ES not found

Version

release 6.9

8.14.4.8 void DCM::DeviceControl::MergedES_InsertDescriptorL (in IPS_RefTS_t *RefTS*, in MergedESDescriptorDataList_t *DescriptorDataList*, in boolean *volatile*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Insert descriptors to merged elementary streams Imported descriptors can be uniquely identified in two ways: either by the tag and the complete descriptor bytestream stream or either by their ID.

The user can give the descriptor a name.

Parameters

in	<i>RefTS</i>	specifies the TS on which descriptors are inserted
in	<i>DescriptorDataList</i>	specifies the inserted descriptors and where they must be inserted the ID parameter should be set to -1 (invalid)
in	<i>volatile</i>	specifies whether the descriptors must be saved to file

Exceptions

<i>OpNotSupported</i>	When called for other boards than IO ones (Main,...).
<i>OpNotSucceeded</i>	In case of • Invalid references (RefTS) • Merged ES not found • Descriptor Data larger than 255 bytes • No more free ID's (2147483646 available)

Version

release 6.9

8.14.4.9 void DCM::DeviceControl::OutTS_GetDescriptorL (in IPS_RefTS_t *RefTS*, in TableKeysExt_t *TableKey*, out DescriptorDataList_t *DescriptorDataList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get ALL descriptors of a table This function can be used to see all descriptors that are available for the specified table at a certain TS.

(dynamic and all inserted descriptors)

Parameters

in	<i>RefTS</i>	specifies the TS on which descriptors are deleted
in	<i>TableKey</i>	specifies which descriptors are to be retrieved. When TableID = 0xFF, all descriptors of the TS are retrieved
out	<i>DescriptorDataList</i>	

Returns

DescriptorDataList list of descriptors

Exceptions

<i>OpNotSupported</i>	When called for other boards than IO ones (Main,...).
<i>OpNotSucceeded</i>	In case of Invalid references (RefTS).

8.14.4.10 void DCM::DeviceControl::OutTs_GetMergedES_DescriptorL (in IPS_RefTS_t *RefTS*, in unsigned long *OutputSID*, out MergedESDescriptorDataList_t *DescriptorDataList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get ALL Merged ES descriptors for a specific output service This function can be used to see all descriptors that are available for the specified table at a certain TS.

(dynamic and all inserted descriptors)

Parameters

in	<i>RefTS</i>	specifies the TS on which descriptors are deleted
in	<i>OutputSID</i>	specifies the output service ID for which the descriptor should be retrieved. 0xFFFFFFFF means for all output service of the given output TS
out	<i>DescriptorDataList</i>	specifies descriptors

Returns

MergedES_DescriptorDataList list of descriptors

Exceptions

<i>OpNotSupported</i>	When called for other boards than IO ones (Main,...).
<i>OpNotSucceeded</i>	In case of Invalid references (RefTS).

Version

release 6.9

8.14.4.11 void DCM::DeviceControl::OutTS_GetSpecDescrOrderRules (in IPS_RefTS_t *RefTS*, in TableKeysExtList_t *TableKeyList*, out DescriptorRuleSetList_t *OrderRulesList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get descriptor order rules Symmetrical with OutTS_SetSpecDescrOrderRules.

Parameters

in	<i>RefTS</i>	specifies the TS for which the rules are retrieved
in	<i>TableKeyList</i>	specifies the table-parts for which the rules are retrieved
out	<i>OrderRulesList</i>	

Returns

OrderRulesList specifies the descriptor order rules and where they must be applied

Exceptions

<i>OpNotSupported</i>	When called for other boards than IO ones (Main,...).
<i>OpNotSucceeded</i>	In case of Invalid references (RefTS).

8.14.4.12 void DCM::DeviceControl::OutTS_GetSpecDescrRemoveRules (in IPS_RefTS_t *RefTS*, in TableKeysExtList_t *TableKeyList*, out DescriptorRuleSetList_t *RemoveRulesList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get descriptor blocking rules Symmetrical with OutTS_SetSpecDescrRemoveRules.

Parameters

in	<i>RefTS</i>	specifies the TS for which the rules are retrieved
in	<i>TableKeyList</i>	specifies the table-parts for which the rules are retrieved
out	<i>RemoveRules-List</i>	

Returns

RemoveRulesList specifies the descriptor blocking rules and where they must be applied

Exceptions

<i>OpNotSupported</i>	When called for other boards than IO ones (Main,...).
<i>OpNotSucceeded</i>	In case of Invalid references (RefTS).

8.14.4.13 void DCM::DeviceControl::OutTS_SetSpecDescrOrderRules (in IPS_RefTS_t *RefTS*, in DescriptorRuleSetList_t *OrderRulesList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set descriptor order rules to parts of a table Full list set and no add or remove, to allow ordering on the GUI.

Call is to be used to add/remove/update the specific rules.

Parameters

in	<i>RefTS</i>	specifies the TS for which the rules are set
in	<i>OrderRulesList</i>	specifies the descriptor order rules and where they must be applied

Returns

DescriptorDataList list of descriptors

Exceptions

<i>OpNotSupported</i>	When called for other boards than IO ones (Main,...).
<i>OpNotSucceeded</i>	In case of • Invalid references (RefTS). • No Tables found • Descriptor Data larger than 255 bytes

8.14.4.14 void DCM::DeviceControl::OutTS_SetSpecDescrRemoveRules (in IPS_RefTS_t *RefTS*, in DescriptorRuleSetList_t *RemoveRulesList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set descriptor blocking rules to parts of a table Full list set and no add or remove, to allow ordering on the GUI.

Call is to be used to add/remove/update the specific rules.

Parameters

in	<i>RefTS</i>	specifies the TS for which the rules are set
in	<i>RemoveRules-List</i>	specifies the descriptor blocking rules and where they must be applied

Exceptions

<i>OpNotSupported</i>	When called for other boards than IO ones (Main,...).
<i>OpNotSucceeded</i>	In case of • Invalid references (RefTS). • No Tables found • Descriptor Data larger than 255 bytes

8.15 Compact CA Descriptor settings

This contains types, enums and methods to configure the handling of compact CA descriptors.

Collaboration diagram for Compact CA Descriptor settings:

Classes

- struct `DCM::DeviceControl::CompactCaMode_t`
Compact CA descriptor setting (per input TS)
- struct `DCM::DeviceControl::InTS_CompactCaMode_t`
Compact CA descriptor settings for specific TS.

Typedefs

- typedef sequence `< InTS_CompactCaMode_t > DCM::DeviceControl::InTS_CompactCaMode_List_t`
A sequence of `InTS_CompactCaMode_t` entries.

Enumerations

- enum `DCM::DeviceControl::eCompactCaMode` { `DCM::DeviceControl::CompactCaModeOff`, `DCM::DeviceControl::CompactCaModeOn` }
Compact CA mode.

Functions

- void `DCM::DeviceControl::InTS_CompactCaMode_SetL` (in `IPS_Ref_t RefPhys`, in `InTS_CompactCaMode_List_t InTS_CompactCaMode_List`) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Set Compact CA descriptor settings for some input TS.
- void `DCM::DeviceControl::InTS_CompactCaMode_GetL` (in `IPS_Ref_t RefPhys`, in `IPS_RefTS_List_t RefTsList`, out `InTS_CompactCaMode_List_t InTS_CompactCaMode_List`) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get Compact CA descriptor settings for some input TS.
- void `DCM::DeviceControl::InTS_CompactCaMode_DeIL` (in `IPS_Ref_t RefPhys`, in `IPS_RefTS_List_t RefTsList`) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Delete the Compact CA descriptor settings for some input TS (revert to default)

- void [DCM::DeviceControl::SetDefault_CompactCaMode](#) (in unsigned short BoardNumber, in e-CompactCaMode CompactCaMode) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set default Compact CA mode settings to be used for all InTS without Compact CA settings.

- void [DCM::DeviceControl::GetDefault_CompactCaMode](#) (in unsigned short BoardNumber, out e-CompactCaMode CompactCaMode) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get default Compact CA mode settings to be used for all InTS without Compact CA settings.

8.15.1 Detailed Description

This contains types, enums and methods to configure the handling of compact CA descriptors.

8.15.2 Typedef Documentation

8.15.2.1 `typedef sequence<InTS_CompactCaMode_t> DCM::DeviceControl::InTS_CompactCaMode_List_t`

A sequence of [InTS_CompactCaMode_t](#) entries.

Definition at line 8121 of file DCM.idl.

8.15.3 Enumeration Type Documentation

8.15.3.1 `enum DCM::DeviceControl::eCompactCaMode`

Compact CA mode.

Enumerator:

CompactCaModeOff Compact CA descriptors are handled like other CA descriptors.

CompactCaModeOn Compact CA descriptors are interpreted and private pids are recognized.

Definition at line 8100 of file DCM.idl.

8.15.4 Function Documentation

8.15.4.1 `void DCM::DeviceControl::GetDefault_CompactCaMode ( in unsigned short BoardNumber, out eCompactCaMode CompactCaMode ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)`

Get default Compact CA mode settings to be used for all InTS without Compact CA settings.

Defaults are attached to a board.

Parameters

in	<i>BoardNumber</i>	The BoardNumber you want information about.
out	<i>CompactCa-Mode</i>	The current default.

Exceptions

<i>OpNotSupported</i>	This call is not supported in the running software version.
<i>OpNotSucceeded</i>	In case of BoardNumber does not exist

8.15.4.2 void DCM::DeviceControl::InTS_CompactCaMode_DelL (in IPS_Ref_t *RefPhys*, in IPS_RefTS_List_t *RefTsList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Delete the Compact CA descriptor settings for some input TS (revert to default)

Parameters

in	<i>RefPhys</i>	The BoardNr and PortNr of which parameters need to be changed.
in	<i>RefTsList</i>	List of Referenced input TS for which to delete the Compact CA settings

Exceptions

<i>OpNotSupported</i>	This call is not supported in the running software version.
<i>OpNotSucceeded</i>	In case of - RefPhys does not exist (or is a backup port) - RefTs does not match RefPhys

8.15.4.3 void DCM::DeviceControl::InTS_CompactCaMode_GetL (in IPS_Ref_t *RefPhys*, in IPS_RefTS_List_t *RefTsList*, out InTS_CompactCaMode_List_t *InTS_CompactCaMode_List*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get Compact CA descriptor settings for some input TS.

Parameters

in	<i>RefPhys</i>	The BoardNr and PortNr you want information about.
in	<i>RefTsList</i>	List of Referenced input TS for which to return the Compact CA Settings. Empty list=all InTs attached to RefPhys
out	<i>InTS_Compact-CaMode_List</i>	List of RefTsIn/CompactCaMode_t pairs

Exceptions

<i>OpNotSupported</i>	This call is not supported in the running software version.
<i>OpNotSucceeded</i>	In case of - RefPhys does not exist (or is a backup port) - RefTs does not match RefPhys

8.15.4.4 void DCM::DeviceControl::InTS_CompactCaMode_SetL (in IPS_Ref_t *RefPhys*,
in InTS_CompactCaMode_List_t *InTS_CompactCaMode_List*) raises (Timeout,
OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set Compact CA descriptor settings for some input TS.

Parameters

in	<i>RefPhys</i>	The BoardNr and PortNr of which parameters need to be changed.
in	<i>InTS_CompactCaMode_List</i>	List of RefTsIn/CompactCaMode_t pairs

Exceptions

<i>OpNotSupported</i>	This call is not supported in the running software version.
<i>OpNotSucceeded</i>	In case of • <i>RefPhys</i> does not exist (or is a backup port) • InTS_CompactCaMode_t out of range

8.15.4.5 void DCM::DeviceControl::SetDefault_CompactCaMode (in unsigned short *BoardNumber*,
in eCompactCaMode *CompactCaMode*) raises (Timeout, OpNotSucceeded, OpNotAllowed,
OpNotSupported)

Set default Compact CA mode settings to be used for all InTS without Compact CA settings.

Defaults are attached to a board. The change takes effect immediately for each input TS that is set to default.

Parameters

in	<i>BoardNumber</i>	The BoardNumber of which parameters need to be changed.
in	<i>CompactCaMode</i>	The new default setting.

Exceptions

<i>OpNotSupported</i>	This call is not supported in the running software version.
<i>OpNotSucceeded</i>	In case of • <i>BoardNumber</i> does not exist • <i>CompactCaMode</i> out of range

8.16 Others

This contains types, enums and methods to configure other settings of the multiplexer part in the device.

Collaboration diagram for Others:

Classes

- struct [DCM::DeviceControl::PSIGSubTable_t](#)
Structure that describes a PSIG provision.
- struct [DCM::DeviceControl::IIOP_SubTable_t](#)
Structure containing the properties a SubTable provisioned via IIOP.
- struct [DCM::DeviceControl::PspUpdateLocation_t](#)
- struct [DCM::DeviceControl::PspUpdateRule_t](#)
Definition of a PspUpdate Rule: number uniquely defining a rule 0: Add/update descriptor 2: Remove descriptor (this list should be updated when more rules are supported) RuleName: actual meaning of the rule (see above) Location: 0x02, 0xFFFFFFFF: PMT 0xCB, start-time: PspEIT event RuleData: extra data of rule in readable form (UTF-8): Add/update descriptor: new descriptor in hex-string.
- struct [DCM::DeviceControl::SvcOutPspUpdateRule_t](#)
- struct [DCM::DeviceControl::Scte35Data_REDUS_Switch_t](#)
The data struct for SCTE-35 command eREDUS_switch.
- struct [DCM::DeviceControl::Scte35Data_REDUS_Switch_Single_t](#)
The data struct for SCTE-35 command eREDUS_switch_single.
- struct [DCM::DeviceControl::Scte35Data_DCM_input_switch_t](#)
The data struct for SCTE-35 command eDCM_input_switch.
- struct [DCM::DeviceControl::Scte35Data_Select_now_t](#)
The data struct for SCTE-35 command eSelect_now.
- struct [DCM::DeviceControl::Scte35Data_Network_active_t](#)
The data struct for SCTE-35 command eNetwork_feed_active_or_inactive.
- struct [DCM::DeviceControl::Scte35Data_Local_avail_t](#)
The data struct for SCTE-35 command eLocal_avail_enable_or_disable.
- struct [DCM::DeviceControl::Scte35Data_Keyer_t](#)
The data struct for SCTE-35 command eKeyer_on_or_off.
- struct [DCM::DeviceControl::Scte35Data_Keyer_config_t](#)
The data struct for SCTE-35 command eKeyer_config.
- struct [DCM::DeviceControl::Scte35Data_Logo_enable_t](#)
The data struct for SCTE-35 command eLogo_enable_or_disable.
- union [DCM::DeviceControl::Scte35CommandAndData_t](#)
Union containing data structures of SCTE-35 commands.
- struct [DCM::DeviceControl::FCS_Scte35_CommandSelect_t](#)

Typedefs

- typedef sequence< PSIGSubTable_t > DCM::DeviceControl::PSIGSubTableList_t
- typedef sequence< IIOP_SubTable_t > DCM::DeviceControl::IIOP_SubTableList_t
A sequence of IIOP_SubTable_t.
- typedef sequence< PsipUpdateRule_t > DCM::DeviceControl::PsipUpdateRuleList_t
- typedef sequence< SvcOutPsipUpdateRule_t > DCM::DeviceControl::SvcOutPsipUpdateRuleList_t
- typedef sequence< Scte35CommandAndData_t > DCM::DeviceControl::Scte35CommandAndData_list_t
- typedef sequence< FCS_Scte35_CommandSelect_t > DCM::DeviceControl::FCS_Scte35_CommandList_t

Enumerations

- enum DCM::DeviceControl::eSource { DCM::DeviceControl::Cached, DCM::DeviceControl::Realtime }
- enum DCM::DeviceControl::eTableStatus { DCM::DeviceControl::Status_OK, DCM::DeviceControl::Status_ParseFailed, DCM::DeviceControl::Status_NotFound, DCM::DeviceControl::Status_Pending }
- enum DCM::DeviceControl::eSubTableRequestMode { DCM::DeviceControl::RequestModeSynchronous, DCM::DeviceControl::RequestModeAsynchronous }
- enum DCM::DeviceControl::enRedusSwitchSource { DCM::DeviceControl::eRedusSwitchSource1, DCM::DeviceControl::eRedusSwitchSource2 }
The different sources for Redus switch.
- enum DCM::DeviceControl::enRedusSwitchMode { DCM::DeviceControl::eRedusSwitchManual, DCM::DeviceControl::eRedusSwitchAutomatic }
The different modes for Redus switch.
- enum DCM::DeviceControl::enTsInputSwitchSource { DCM::DeviceControl::eTsInputSwitchSourceMain, DCM::DeviceControl::eTsInputSwitchSourceBackup }
The different sources for TS backup.
- enum DCM::DeviceControl::enTsInputSwitchMode { DCM::DeviceControl::eTsInputSwitchManual, DCM::DeviceControl::eTsInputSwitchAutomatic }
The different modes for TS backup.
- enum DCM::DeviceControl::enNetworkFeedActiveIndicator { DCM::DeviceControl::eNetworkFeedInactive, DCM::DeviceControl::eNetworkFeedActive, DCM::DeviceControl::eNetworkFeedUnknown }
The different values of the Network Feed Active indicator.
- enum DCM::DeviceControl::enLocalFeedAvailableIndicator { DCM::DeviceControl::eLocalFeedNotAvailable, DCM::DeviceControl::eLocalFeedAvailable, DCM::DeviceControl::eLocalFeedUnknown }
The different values of the Local Feed Available indicator.
- enum DCM::DeviceControl::enMotionMode { DCM::DeviceControl::eMotionModeReserverd0, DCM::DeviceControl::eMotionModeReserverd1, DCM::DeviceControl::ePalindromeOnce, DCM::DeviceControl::ePalindromeLoop, DCM::DeviceControl::eDefault, DCM::DeviceControl::eOnce, DCM::DeviceControl::eLoop, DCM::DeviceControl::eStatic }
The different values of motion mode (logo insertion related)

- enum `DCM::DeviceControl::enScte35Commands` { `DCM::DeviceControl::eREDUS_switch`, `DCM::DeviceControl::eDCM_input_switch`, `DCM::DeviceControl::eSelect_now`, `DCM::DeviceControl::eNetwork_feed_active_or_inactive`, `DCM::DeviceControl::eLocal_avail_enable_or_disable`, `DCM::DeviceControl::eSplicer_reset`, `DCM::DeviceControl::eKeyer_on_or_off`, `DCM::DeviceControl::eKeyer_config`, `DCM::DeviceControl::eLogo_enable_or_disable`, `DCM::DeviceControl::eLogo_reset`, `DCM::DeviceControl::eREDUS_switch_single`, `DCM::DeviceControl::eScte35CommandReserved06`, `DCM::DeviceControl::eScte35CommandReserved07`, `DCM::DeviceControl::eScte35CommandReserved08`, `DCM::DeviceControl::eScte35CommandReserved09`, `DCM::DeviceControl::eScte35CommandReserved10`, `DCM::DeviceControl::eScte35CommandReserved11`, `DCM::DeviceControl::eScte35CommandReserved12`, `DCM::DeviceControl::eScte35CommandReserved13`, `DCM::DeviceControl::eScte35CommandReserved14`, `DCM::DeviceControl::eScte35CommandReserved15` }

The different types of SCTE-35 commands.

- enum `DCM::DeviceControl::enFCS_Scte35_Commands` { `DCM::DeviceControl::eBasicScte35`, `DCM::DeviceControl::eInputScte35`, `DCM::DeviceControl::eOutputScte35`, `DCM::DeviceControl::eReservedForFuture1`, `DCM::DeviceControl::eReservedForFuture2`, `DCM::DeviceControl::eReservedForFuture3`, `DCM::DeviceControl::eReservedForFuture4`, `DCM::DeviceControl::eReservedForFuture5`, `DCM::DeviceControl::eReservedForFuture6`, `DCM::DeviceControl::eReservedForFuture7`, `DCM::DeviceControl::eReservedForFuture8`, `DCM::DeviceControl::eReservedForFuture9`, `DCM::DeviceControl::eReservedForFuture10` }

Functions

- void `DCM::DeviceControl::GetSubTable` (in `IPS_RefTS_t` TS, in boolean Input, in `TableKeys_t` Key, in unsigned short Pid, in eSource Location, out `ByteStream SIData`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Retrieves the PSI table (PAT, CAT and PMT) of a given TS in binary format.

- void `DCM::DeviceControl::GetSubTableAsXML` (in `IPS_RefTS_t` TS, in boolean Input, in `TableKeys_t` Key, in unsigned short Pid, in eSource Location, out `ByteStream SIDataXML`, out eTableStatus Status) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Retrieves the PSI table (PAT, CAT and PMT) of a given TS in XML format.

- void `DCM::DeviceControl::GetSubTableBinaryAndXML` (in `IPS_RefTS_t` TS, in boolean Input, in `TableKeys_t` Key, in unsigned short Pid, in eSource Location, in eSubTableRequestMode RequestMode, in string SessionID, out `ByteStream SIDataXML`, out `ByteStream SIData`, out eTableStatus Status) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Retrieves the PSI table (PAT, CAT and PMT) of a given TS in XML format.

- void `DCM::DeviceControl::GetPSIGSubTables` (in unsigned long ONID, in unsigned long TSID, out `PSIGSubTableList_t PSIGSubTableList`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Retrieves the list of currently active PSIG imported tables.

- void `DCM::DeviceControl::GetPSIGSubTableBinary` (in `PSIGSubTable_t PSIGSubTable`, out `ByteStream SIData`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Retrieves a PSIG imported subtable.

- void `DCM::DeviceControl::ImportSubTable` (in unsigned long OnId, in unsigned long TsId, in boolean bPureImport, in unsigned short Pid, in `ByteStream Data`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Imports an SI sub-table via IIOP.

- void `DCM::DeviceControl::GetImportedSubTableL` (in unsigned long OnId, in unsigned long TsId, out `IIOP_SubTableList_t SubTableList`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the list of SI sub-tables provisioned via IIOP.

- void [DCM::DeviceControl::DeleteImportedSubTableL](#) (in [IIOP_SubTableList_t](#) SubTableList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Deprovision one or more previously provisioned SI sub-tables.
- [SvcOutPspipUpdateRuleList_t](#) [DCM::DeviceControl::OutSvc_GetPspipUpdateRuleL](#) (in [IPS_RefTS_t](#) RefTS, in [ServiceIdList_t](#) OutputSidList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Retrieves the PspipUpdate rules as given via Scte35-extended for a list of services.
- void [DCM::DeviceControl::Scte35CommandGetL](#) (in [IPS_Service_t](#) SvcOut, out [Scte35CommandAndData_list_t](#) Scte35CommandAndData_list) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get the list of commands received through SCTE-35.
- void [DCM::DeviceControl::StationID_Get](#) (in unsigned short BoardNr, out unsigned short StationID) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get the Station ID.
- void [DCM::DeviceControl::StationID_Set](#) (in unsigned short BoardNr, in unsigned short StationID) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Set the Station ID.
- void [DCM::DeviceControl::NetworkFeedActiveIndicatorGet](#) (in [IPS_Service_t](#) SvcOut, out [enNetworkFeedActiveIndicator](#) Network_active_indicator) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get the status of the Network Feed Active Indicator.
- void [DCM::DeviceControl::LocalFeedAvailableIndicatorGet](#) (in [IPS_Service_t](#) SvcOut, out [enLocalFeedAvailableIndicator](#) Local_avail_indicator) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get the status of the Local Feed Available Indicator.
- void [DCM::DeviceControl::FCS_SetScte35_CommandExecuteL](#) (in [IPS_RefTS_t](#) RefTS, in [FCS_Scte35_CommandList_t](#) Scte35_CommandList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Sets the list of customer specific SCTE_35 commands to be handled by the specified output services - Additionally sets the service that handles the 'splice to local' when a program select is received and the command handling is set to eInputScte35.
- void [DCM::DeviceControl::FCS_GetScte35_CommandExecuteL](#) (in [IPS_RefTS_t](#) RefTS, in [ServiceIdList_t](#) OutputSidList, out [FCS_Scte35_CommandList_t](#) Scte35_CommandList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Gets the list of customer specific SCTE_35 commands to be handled by the specified output service.

8.16.1 Detailed Description

This contains types, enums and methods to configure other settings of the multiplexer part in the device.

8.16.2 Typedef Documentation

8.16.2.1 `typedef sequence<FCS_Scte35_CommandSelect_t> DCM::DeviceControl::FCS_Scte35_CommandList_t`

Definition at line 8780 of file DCM.idl.

8.16.2.2 `typedef sequence<IIOP_SubTable_t> DCM::DeviceControl::IIOP_SubTableList_t`

A sequence of [IIOP_SubTable_t](#).

Definition at line 8402 of file DCM.idl.

8.16.2.3 typedef sequence<PSIGSubTable_t> DCM::DeviceControl::PSIGSubTableList_t

Definition at line 8350 of file DCM.idl.

8.16.2.4 typedef sequence<PsipUpdateRule_t> DCM::DeviceControl::PsipUpdateRuleList_t

Definition at line 8490 of file DCM.idl.

8.16.2.5 typedef sequence<Scte35CommandAndData_t> DCM::DeviceControl::Scte35CommandAndData_list_t

Definition at line 8692 of file DCM.idl.

8.16.2.6 typedef sequence<SvcOutPsipUpdateRule_t> DCM::DeviceControl::SvcOutPsipUpdateRuleList_t

Definition at line 8498 of file DCM.idl.

8.16.3 Enumeration Type Documentation**8.16.3.1 enum DCM::DeviceControl::enFCS_Scte35_Commands**

Enumerator:

eBasicScte35
eInputScte35 < Process all basic SCTE35 commands, default
eOutputScte35
eReservedForFuture1
eReservedForFuture2
eReservedForFuture3
eReservedForFuture4
eReservedForFuture5
eReservedForFuture6
eReservedForFuture7
eReservedForFuture8
eReservedForFuture9
eReservedForFuture10

Definition at line 8754 of file DCM.idl.

8.16.3.2 enum DCM::DeviceControl::enLocalFeedAvailableIndicator

The different values of the Local Feed Available indicator.

Enumerator:

eLocalFeedNotAvailable
eLocalFeedAvailable
eLocalFeedUnknown

Definition at line 8554 of file DCM.idl.

8.16.3.3 enum DCM::DeviceControl::enMotionMode

The different values of motion mode (logo insertion related)

Enumerator:

eMotionModeReserverd0
eMotionModeReserverd1
ePalindromeOnce
ePalindromeLoop
eDefault
eOnce
eLoop
eStatic

Definition at line 8562 of file DCM.idl.

8.16.3.4 enum DCM::DeviceControl::enNetworkFeedActiveIndicator

The different values of the Network Feed Active indicator.

Enumerator:

eNetworkFeedInactive
eNetworkFeedActive
eNetworkFeedUnknown

Definition at line 8546 of file DCM.idl.

8.16.3.5 enum DCM::DeviceControl::enRedusSwitchMode

The different modes for Redus switch.

Enumerator:

eRedusSwitchManual
eRedusSwitchAutomatic

Definition at line 8525 of file DCM.idl.

8.16.3.6 enum DCM::DeviceControl::enRedusSwitchSource

The different sources for Redus switch.

Enumerator:

eRedusSwitchSource1 Sometimes referred to as ?A? instead of ?1?
eRedusSwitchSource2 Sometimes referred to as ?B? instead of ?2?

Definition at line 8518 of file DCM.idl.

8.16.3.7 enum DCM::DeviceControl::enScte35Commands

The different types of SCTE-35 commands.

Enumerator:

eREDUS_switch
eDCM_input_switch
eSelect_now
eNetwork_feed_active_or_inactive
eLocal_avail_enable_or_disable
eSplicer_reset
eKeyer_on_or_off
eKeyer_config
eLogo_enable_or_disable
eLogo_reset
eREDUS_switch_single
eScte35CommandReserved06
eScte35CommandReserved07
eScte35CommandReserved08
eScte35CommandReserved09
eScte35CommandReserved10
eScte35CommandReserved11
eScte35CommandReserved12
eScte35CommandReserved13
eScte35CommandReserved14
eScte35CommandReserved15

Definition at line 8575 of file DCM.idl.

8.16.3.8 enum DCM::DeviceControl::enTsInputSwitchMode

The different modes for TS backup.

< In context of TS backup

Enumerator:

eTsInputSwitchManual
eTsInputSwitchAutomatic

Definition at line 8539 of file DCM.idl.

8.16.3.9 enum DCM::DeviceControl::enTsInputSwitchSource

The different sources for TS backup.

< In context of TS backup

Enumerator:

eTsInputSwitchSourceMain Sometimes referred to as ?A? instead of ?Main?
eTsInputSwitchSourceBackup Sometimes referred to as ?B? instead of ?Backup?

Definition at line 8532 of file DCM.idl.

8.16.3.10 enum DCM::DeviceControl::eSource

Enumerator:

*Cached**Realtime*

Definition at line 8216 of file DCM.idl.

8.16.3.11 enum DCM::DeviceControl::eSubTableRequestMode

Enumerator:

*RequestModeSynchronous**RequestModeAsynchronous*

Definition at line 8228 of file DCM.idl.

8.16.3.12 enum DCM::DeviceControl::eTableStatus

Enumerator:

*Status_OK**Status_ParseFailed**Status_NotFound**Status_Pending*

Definition at line 8221 of file DCM.idl.

8.16.4 Function Documentation**8.16.4.1 void DCM::DeviceControl::DeleteImportedSubTableL (in IIOP_SubTableList_t SubTableList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)**

Deprovision one or more previously provisioned SI sub-tables.

Parameters

in	<i>SubTableList</i>	List of sub-tables to deprovision.
----	---------------------	------------------------------------

Exceptions

<i>OpNotSucceeded</i>	if one or more sub-tables were not found.
-----------------------	---

Version

Release 8.5

8.16.4.2 void DCM::DeviceControl::FCS_GetScte35_CommandExecuteL (in IPS_RefTS_t RefTS, in ServiceIdList_t OutputSidList, out FCS_Scte35_CommandList_t Scte35_CommandList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the list of customer specific SCTE_35 commands to be handled by the specified output service.

Parameters

in	<i>RefTS</i>	: The TS the services belong to.
in	<i>OutputSidList</i>	: A list of Service ID's to get info about.
out	<i>Scte35_CommandList</i>	: a List of commands that will be handled by this output service

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case invalid output references are used (RefTS, OutputSidList).

Version

Release 7.1

8.16.4.3 void DCM::DeviceControl::FCS_SetScte35_CommandExecuteL (in IPS_RefTS_t *RefTS*, in FCS_Scte35_CommandList_t *Scte35_CommandList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Sets the list of customer specific SCTE_35 commands to be handled by the specified output services - Additionally sets the service that handles the 'splice to local' when a program select is received and the command handling is set to eInputScte35.

Parameters

in	<i>RefTS</i>	: The TS the services belong to.
in	<i>Scte35_CommandList</i>	: a List of commands that will be handled by this output service

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case • invalid references are used • invalid values in Scte35_CommandList • no SwitchToLocalSvc is provided when the command handling is set to e-InputScte35 • The SwitchToLocalSvc is not on the same board as the SvcOut

Version

Release 7.1

8.16.4.4 void DCM::DeviceControl::GetImportedSubTableL (in unsigned long *OnId*, in unsigned long *TsId*, out IIOP_SubTableList_t *SubTableList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the list of SI sub-tables provisioned via IIOP.

Use this function to retrieve references of imported sub-tables for deprovisioning.

Parameters

in	<i>OnId</i>	ONID of TS. Set to 0xFFFFFFFF to retrieve all sub-tables.
in	<i>TsId</i>	TSID of TS. Set to 0xFFFFFFFF to retrieve all sub-tables.
out	<i>SubTableList</i>	List of provisioned SubTables.

Exceptions

<i>OpNotSucceeded</i>	in case of a general error.
-----------------------	-----------------------------

Version

Release 8.5

8.16.4.5 void DCM::DeviceControl::GetPSIGSubTableBinary (in PSIGSubTable_t *PSIGSubTable*, out ByteStream *SIData*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Retrieves a PSIG imported subtable.

This function will return the one (sub)table that matches the table identification if it exists. If no such table exists, the function succeeds but the *SIData* stream is empty.

Parameters

in	<i>PSIGSubTable</i>	The identification of the table, as it was obtained using the function GetPSIGSubTables.
out	<i>SIData</i>	The data as received from the PSIG. This is not necessarily the same data as is present on the output. This data corresponds to one subtable from a PSIG provision. Note that a PSIG provision can contain multiple subtables. In this case each call to this function will return only the part of the provision that corresponds with the subtable which is identified in the PSIGSubTable parameter, and multiple calls will be needed to retrieve all data.

Exceptions

<i>OpNotSucceeded</i>	An internal error occurred, or the input parameters could not be retrieved. Should not normally occur.
-----------------------	--

8.16.4.6 void DCM::DeviceControl::GetPSIGSubTables (in unsigned long *ONID*, in unsigned long *TSID*, out PSIGSubTableList_t *PSIGSubTableList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Retrieves the list of currently active PSIG imported tables.

Tables with an activation time in the future will not be returned by this function. This function returns the lists of tables exactly as they have been imported on PSIG. This means, for example, that when provisions are conflicting, both provisions will be returned, even if only one of them can be active at any given time. All provisions for all PSIG connections are always returned.

Parameters

in	<i>ONID</i>	Return only tables imported for this ONID. Set this parameter to 0xFFFF FFFF (ONID_DONT_CARE) to return tables for all ONIDs.
----	-------------	---

in	<i>TSID</i>	Return only tables imported for this TSID. Set this parameter to 0xFFFF-FFFF (TSID_DONT_CARE) to return tables for all TSIDs.
out	<i>PSIGSubTable-List</i>	This output parameter receives the list of currently active PSIG provisions.

Exceptions

<i>OpNotSucceeded</i>	An internal error occurred, or the input parameters could not be retrieved. Should not normally occur.
-----------------------	--

8.16.4.7 void DCM::DeviceControl::GetSubTable (in IPS_RefTS_t *TS*, in boolean *Input*, in TableKeys_t *Key*, in unsigned short *Pid*, in eSource *Location*, out ByteStream *SIData*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Retrieves the PSI table (PAT, CAT and PMT) of a given TS in binary format.

Parameters

in	<i>TS</i>	Holds the identification of the Port and eventually TS.
in	<i>Input</i>	Determines if we are requesting a table from input or output.
in	<i>Key</i>	Holds the identification of the requested PSI table.
in	<i>Pid</i>	The pid to acquire. Wildcard: ANY_PID_VALUE, this means that the standard PID-value of the table will be used.
in	<i>Location</i>	Determines if the table is retrieved cached or real-time.
out	<i>SIData</i>	The table information returned.

Exceptions

<i>OpNotSucceeded</i>	when TS does not exist or does not match given input flag.
<i>OpNotSucceeded</i>	is returned when a transparent PSI table is requested from the output or if a blocked PSI table is requested.

8.16.4.8 void DCM::DeviceControl::GetSubTableAsXML (in IPS_RefTS_t *TS*, in boolean *Input*, in TableKeys_t *Key*, in unsigned short *Pid*, in eSource *Location*, out ByteStream *SIDataXML*, out eTableStatus *Status*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Retrieves the PSI table (PAT, CAT and PMT) of a given TS in XML format.

Parameters

in	<i>TS</i>	Holds the identification of the Port and eventually TS.
in	<i>Input</i>	Determines if we are requesting a table from input or output.
in	<i>Key</i>	Holds the identification of the requested PSI table.
in	<i>Pid</i>	The pid to acquire. Wildcard: ANY_PID_VALUE, this means that the standard PID-value of the table will be used.
in	<i>Location</i>	Determines if the table is retrieved cached or real-time.
out	<i>SIDataXML</i>	ByteStream
out	<i>Status</i>	eTableStatus.

Exceptions

<i>OpNotSucceeded</i>	when TS does not exist or does not match given input flag.
<i>OpNotSucceeded</i>	is returned when a transparent PSI table is requested from the output or if a blocked PSI table is requested.

8.16.4.9 void DCM::DeviceControl::GetSubTableBinaryAndXML (in IPS_RefTS_t *TS*, in boolean *Input*, in TableKeys_t *Key*, in unsigned short *Pid*, in eSource *Location*, in eSubTableRequestMode *RequestMode*, in string *SessionID*, out ByteStream *SIDataXML*, out ByteStream *SIData*, out eTableStatus *Status*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Retrieves the PSI table (PAT, CAT and PMT) of a given TS in XML format.

Parameters

in	<i>TS</i>	Holds the identification of the Port and eventually TS.
in	<i>Input</i>	Determines if we are requesting a table from input or output.
in	<i>Key</i>	Holds the identification of the requested PSI table.
in	<i>Pid</i>	The pid to acquire. Wildcard: ANY_PID_VALUE, this means that the standard PID-value of the table will be used.
in	<i>Location</i>	Determines if the table is retrieved cached or real-time.
in	<i>RequestMode</i>	Determines if the table is requested synchronously or asynchronously.
in	<i>SessionID</i>	Session ID of the GUI currently requesting the table.
out	<i>SIDataXML</i>	Requested table is returned in XML format.
out	<i>SIData</i>	Requested table is returned in binary format.
out	<i>Status</i>	Status of the requested table

Exceptions

<i>OpNotSucceeded</i>	when TS does not exist or does not match given input flag.
<i>OpNotSucceeded</i>	is returned when a transparent PSI table is requested from the output or if a blocked PSI table is requested.

8.16.4.10 void DCM::DeviceControl::ImportSubTable (in unsigned long *OnId*, in unsigned long *TsId*, in boolean *bPureImport*, in unsigned short *Pid*, in ByteStream *Data*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Imports an SI sub-table via IIOP.

This function imports an SI sub-table via IIOP in the same way as this is done via the PSIG to MUX interface. The provisioned SI table is played out on each transport stream with matching ONID / TSID. The table keys are extracted from the provided binary data. It is possible to provide new binary data for an existing sub-table. This results in provisioning of the new binary data. Supported table ID's: NITactual, NITother.

Parameters

in	<i>OnId</i>	The original network ID of matching output TS.
in	<i>TsId</i>	Transport stream ID of matching output TS.
in	<i>bPureImport</i>	If true binary data will be played out with no modifications.
in	<i>Pid</i>	Output PID used for playout of the SI table.
in	<i>Data</i>	The SI table in binary data format.

Exceptions

<i>OpNotSucceeded</i>	if invalid parameters are provided, binary data contains a not supported table ID or any other error.
-----------------------	---

Version

Release 8.5

8.16.4.11 void DCM::DeviceControl::LocalFeedAvailableIndicatorGet (in IPS_Service_t *SvcOut*, out enLocalFeedAvailableIndicator *Local_avail_indicator*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the status of the Local Feed Available Indicator.

Parameters

in	<i>SvcOut</i>	The output service of which the SCTE-35 commands have been parsed.
out	<i>Local_avail_indicator</i>	

Exceptions

<i>OpNotSucceeded</i>	In case of invalid reference (SvcOut)
-----------------------	---------------------------------------

Version

Release 7.1

8.16.4.12 void DCM::DeviceControl::NetworkFeedActiveIndicatorGet (in IPS_Service_t *SvcOut*, out enNetworkFeedActiveIndicator *Network_active_indicator*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the status of the Network Feed Active Indicator.

Parameters

in	<i>SvcOut</i>	The output service of which the SCTE-35 commands have been parsed.
out	<i>Network_active_indicator</i>	

Exceptions

<i>OpNotSucceeded</i>	In case of invalid reference (SvcOut)
-----------------------	---------------------------------------

Version

Release 7.1

8.16.4.13 `SvcOutPsipUpdateRuleList_t DCM::DeviceControl::OutSvc_GetPsipUpdateRuleL ( in IPS_RefTS_t RefTS, in ServiceIdList_t OutputSidList )` raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Retrieves the PsipUpdate rules as given via Scte35-extended for a list of services.

Parameters

in	<i>RefTS</i>	specifies the TS where we want to retrieve.
in	<i>OutputSidList</i>	: list of output service ids for which the PsipUpdate rules should be returned.

Returns

PsipUpdateRuleList_t : List of [PsipUpdateRule_t](#) entries

Exceptions

<i>OpNotSupported</i>	When called for other boards than IO ones (Main,...).
<i>OpNotSucceeded</i>	In case of Invalid references (RefTS)

Version

Release 7.1

8.16.4.14 `void DCM::DeviceControl::Scte35CommandGetL ( in IPS_Service_t SvcOut, out Scte35CommandAndData_list_t Scte35CommandAndData_list )` raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the list of commands received through SCTE-35.

Each type of command can occur maximum once in the list.

Parameters

in	<i>SvcOut</i>	The output service of which the SCTE-35 commands have been parsed.
out	<i>Scte35-CommandAnd-Data_list</i>	List of commands

Exceptions

<i>OpNotSucceeded</i>	In case of invalid reference (SvcOut)
-----------------------	---------------------------------------

Version

Release 7.1

8.16.4.15 void DCM::DeviceControl::StationID_Get (in unsigned short *BoardNr*, out unsigned short *StationID*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the Station ID.

Parameters

in	<i>BoardNr</i>	
out	<i>StationID</i>	Identifies where the DCM is located.

Exceptions

<i>OpNotSucceeded</i>	In case of invalid BoardNr
-----------------------	----------------------------

Version

Release 7.1

8.16.4.16 void DCM::DeviceControl::StationID_Set (in unsigned short *BoardNr*, in unsigned short *StationID*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the Station ID.

Parameters

in	<i>BoardNr</i>	
in	<i>StationID</i>	Identifies where the DCM is located. Range is [0, 255].

Exceptions

<i>OpNotSucceeded</i>	In case of invalid BoardNr
-----------------------	----------------------------

Version

Release 7.1

8.17 PSIP

This module contains types, enums and methods related to ATSC PSIP (Program and System Information Protocol)

Collaboration diagram for PSIP:

Classes

- struct [DCM::DeviceControl::MultipleStringSegment_t](#)
Multiple String: ATSC string representation.
- struct [DCM::DeviceControl::MultipleStringElement_t](#)
- struct [DCM::DeviceControl::OutTsStandard_t](#)
Transport stream specific Output TS Standard setting parameters.
- struct [DCM::DeviceControl::OutTS_SttTimeZone_t](#)
Transport stream specific STT time zone setting.
- struct [DCM::DeviceControl::VCT_Data_t](#)
Structure that contains settings about the Virtual Channel Table of a service.
- struct [DCM::DeviceControl::VCT_SvcInput_t](#)
Structure that contains status about the Virtual Channel Table of a service on input.
- struct [DCM::DeviceControl::VCT_Forcing_t](#)
- struct [DCM::DeviceControl::VCT_SvcSetting_t](#)
Structure combining service-id with settings.
- struct [DCM::DeviceControl::VCT_SvcData_t](#)
Structure that contains status about the Virtual Channel Table of a service.
- struct [DCM::DeviceControl::OutTsServiceLocationAdded_t](#)
Transport stream specific "Service Location Added" setting parameters.
- struct [DCM::DeviceControl::OutTS_PsipEitStartPid_t](#)
- struct [DCM::DeviceControl::OutTS_PsipEttStartPid_t](#)
- struct [DCM::DeviceControl::Svc_PsipEitRegenerationInfo_t](#)
Structure combining service information with the number of regenerated PSIP-EIT subtables.
- struct [DCM::DeviceControl::Svc_PsipEttRegenerationInfo_t](#)
Structure combining service information with the number of regenerated PSIP-ETT subtables.
- struct [DCM::DeviceControl::OutTS_PsipEttvPid_t](#)
- struct [DCM::DeviceControl::ETTV_ContentSetting_t](#)
Structure combining service-id with settings.
- struct [DCM::DeviceControl::ETTV_ContentData_t](#)
Structure that contains status about the Content of an ETTV.
- struct [DCM::DeviceControl::PspMgtInfo_t](#)
- struct [DCM::DeviceControl::TS_PspMgtInfo_t](#)

Typedefs

- typedef sequence < MultipleStringElement_t > DCM::DeviceControl::MultipleString_t
- typedef sequence< OutTsStandard_t > DCM::DeviceControl::OutTsStandardList_t
A sequence of OutTsStandard_t.
- typedef sequence < OutTS_SttTimeZone_t > DCM::DeviceControl::OutTS_SttTimeZone_List_t
A sequence of OutTS_SttTimeZone_t.
- typedef sequence< VCT_SvcInput_t > DCM::DeviceControl::VCT_SvcInput_List_t
A sequence of VCT_SvcInput_t.
- typedef sequence < VCT_SvcSetting_t > DCM::DeviceControl::VCT_SvcSetting_List_t
A sequence of VCT_Setting_t.
- typedef sequence< VCT_SvcData_t > DCM::DeviceControl::VCT_SvcData_List_t
A sequence of VCT_Data_t.
- typedef sequence < OutTsServiceLocationAdded_t > DCM::DeviceControl::OutTsServiceLocation-AddedList_t
- typedef sequence < OutTS_PsipEitStartPid_t > DCM::DeviceControl::OutTS_PsipEitStartPidList-_t
- typedef sequence < OutTS_PsipEttStartPid_t > DCM::DeviceControl::OutTS_PsipEttStartPidList-_t
- typedef sequence < Svc_PsipEitRegenerationInfo_t > DCM::DeviceControl::Svc_PsipEitRegeneration-InfoList_t
A sequence of Svc_PsipEitRegenerationInfo_t.
- typedef sequence < Svc_PsipEttRegenerationInfo_t > DCM::DeviceControl::Svc_PsipEttRegeneration-InfoList_t
A sequence of Svc_PsipEttRegenerationInfo_t.
- typedef sequence < OutTS_PsipEttvPid_t > DCM::DeviceControl::OutTS_PsipEttvPid_List_t
- typedef sequence < ETTV_ContentSetting_t > DCM::DeviceControl::ETTV_ContentSetting_List-_t
A sequence of ETTV_ContentSetting_t.
- typedef sequence < ETTV_ContentData_t > DCM::DeviceControl::ETTV_ContentData_List_t
A sequence of ETTV_ContentData_t.
- typedef sequence< PsipMgtInfo_t > DCM::DeviceControl::PsipMgtInfoList_t
- typedef sequence < TS_PsipMgtInfo_t > DCM::DeviceControl::TS_PsipMgtInfoList_t

Enumerations

- enum DCM::DeviceControl::eTableStandard_t { DCM::DeviceControl::eTableStandardAll, DCM::DeviceControl::eTableStandardMPEG2, DCM::DeviceControl::eTableStandardDVB, DCM::DeviceControl::eTableStandardATSC }
Transport Stream standard to guide generation (and display) of output tables.
- enum DCM::DeviceControl::eTriBool { DCM::DeviceControl::eTB_Transparent, DCM::DeviceControl::eTB_False, DCM::DeviceControl::eTB_True }
- enum DCM::DeviceControl::eVctModulation { DCM::DeviceControl::eVctModulationMode_Transparent, DCM::DeviceControl::eVctModulationMode_Analog, DCM::DeviceControl::eVctModulationMode_Qam64, DCM::DeviceControl::eVctModulationMode_Qam256, DCM::DeviceControl::eVctModulationMode_Vsb8, DCM::DeviceControl::eVctModulationMode_Vsb16 }
- enum DCM::DeviceControl::eVctEtmLocation { DCM::DeviceControl::eVctEtmLocation_Transparent, DCM::DeviceControl::eVctEtmLocation_NoEtm, DCM::DeviceControl::eVctEtmLocation_InternalEtm, DCM::DeviceControl::eVctEtmLocation_ExternalEtm }

- enum `DCM::DeviceControl::eVctServiceType` { `DCM::DeviceControl::eVctServiceType_Transparent`, `DCM::DeviceControl::eVctServiceType_Analog`, `DCM::DeviceControl::eVctServiceType_Digital-television`, `DCM::DeviceControl::eVctServiceType_Digital_audio`, `DCM::DeviceControl::eVctServiceType_Digital_data` }

Functions

- void `DCM::DeviceControl::SetDefaultOutputTsStandard` (in unsigned short Board, in `eTableStandard_t` eNew) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Set the default output TS standard.
- void `DCM::DeviceControl::GetDefaultOutputTsStandard` (in unsigned short Board, out `eTableStandard_t` eStandard) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get the default output TS standard.
- void `DCM::DeviceControl::OutputTsStandardSetL` (in `IPS_Ref_t` RefPhys, in `OutTsStandardList_t` lst) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Set Output TS Standard for some OutTS.
- void `DCM::DeviceControl::OutputTsStandardGetL` (in `IPS_Ref_t` RefPhys, in `IPS_RefTS_List_t` - `RefTsList`, out `OutTsStandardList_t` lst) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get Output TS Standard for some OutTS.
- void `DCM::DeviceControl::SetGpsUtcOffset` (in unsigned short Board, in unsigned short Offset) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Set the GPS-UTC offset.
- void `DCM::DeviceControl::GetGpsUtcOffset` (in unsigned short Board, out unsigned short Offset) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get the GPS-UTC offset.
- void `DCM::DeviceControl::OutTS_SttTimeZone_SetL` (in `IPS_Ref_t` RefPhys, in `OutTS_SttTimeZone_List_t` lst) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Set STT time zone for some OutTS.
- void `DCM::DeviceControl::OutTS_SttTimeZone_GetL` (in `IPS_Ref_t` RefPhys, in `IPS_RefTS_List_t` - `RefTsList`, out `OutTS_SttTimeZone_List_t` lst) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get STT time zone for some OutTS.
- `VCT_SvcInput_List_t` `DCM::DeviceControl::VCT_InputData_GetL` (in `IPS_RefTS_t` RefTS, in `-ServiceIdList_t` SidList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get VCT data for some input services.
- `VCT_SvcData_List_t` `DCM::DeviceControl::CVCT_OutputData_GetL` (in `IPS_RefTS_t` RefTS, in `-ServiceIdList_t` SidList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get CVCT data (settings and input) for some output services.
- `VCT_SvcData_List_t` `DCM::DeviceControl::TVCT_OutputData_GetL` (in `IPS_RefTS_t` RefTS, in `-ServiceIdList_t` SidList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get TVCT data (settings and input) for some output services.
- void `DCM::DeviceControl::CVCT_OutputData_SetL` (in `IPS_RefTS_t` RefTS, in `VCT_SvcSetting_List_t` lst) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Set CVCT settings for some output services.
- void `DCM::DeviceControl::TVCT_OutputData_SetL` (in `IPS_RefTS_t` RefTS, in `VCT_SvcSetting_List_t` lst) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Set TVCT settings for some output services.

- void `DCM::DeviceControl::CVCT_ServiceLocationAddedSetL` (in `IPS_Ref_t RefPhys`, in `OutTsServiceLocationAddedList_t AddedList`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set per TS whether the service location descriptor must be added per CVCT fragment.

- void `DCM::DeviceControl::CVCT_ServiceLocationAddedGetL` (in `IPS_Ref_t RefPhys`, in `IPS_RefTS_List_t RefTsList`, out `OutTsServiceLocationAddedList_t AddedList`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get per TS whether the service location descriptor must be added per CVCT fragment.

- void `DCM::DeviceControl::TVCT_ServiceLocationAddedSetL` (in `IPS_Ref_t RefPhys`, in `OutTsServiceLocationAddedList_t AddedList`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set per TS whether the service location descriptor must be added per TVCT fragment.

- void `DCM::DeviceControl::TVCT_ServiceLocationAddedGetL` (in `IPS_Ref_t RefPhys`, in `IPS_RefTS_List_t RefTsList`, out `OutTsServiceLocationAddedList_t AddedList`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get per TS whether the service location descriptor must be added per TVCT fragment.

- void `DCM::DeviceControl::SetDefault_PsipEitStartPid` (in unsigned short Board, in unsigned short StartPid) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the default output PSIP-EIT start PID.

- void `DCM::DeviceControl::GetDefault_PsipEitStartPid` (in unsigned short Board, out unsigned short StartPid) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the default output PSIP-EIT start PID.

- void `DCM::DeviceControl::SetDefault_PsipEttStartPid` (in unsigned short Board, in unsigned short StartPid) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the default output PSIP-ETT start PID.

- void `DCM::DeviceControl::GetDefault_PsipEttStartPid` (in unsigned short Board, out unsigned short StartPid) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the default output PSIP-ETT start PID.

- void `DCM::DeviceControl::OutTS_PsipEitStartPid_SetL` (in `IPS_Ref_t RefPhys`, in `OutTS_PsipEitStartPidList_t StartPidList`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set Output TS PSIP-EIT start PID for some OutTS.

- void `DCM::DeviceControl::OutTS_PsipEitStartPid_GetL` (in `IPS_Ref_t RefPhys`, in `IPS_RefTS_List_t RefTsList`, out `OutTS_PsipEitStartPidList_t StartPidList`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get Output TS PSIP-EIT start PID for some OutTS.

- void `DCM::DeviceControl::OutTS_PsipEttStartPid_SetL` (in `IPS_Ref_t RefPhys`, in `OutTS_PsipEttStartPidList_t StartPidList`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set Output TS PSIP-ETT start PID for some OutTS.

- void `DCM::DeviceControl::OutTS_PsipEttStartPid_GetL` (in `IPS_Ref_t RefPhys`, in `IPS_RefTS_List_t RefTsList`, out `OutTS_PsipEttStartPidList_t StartPidList`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get Output TS PSIP-ETT start PID for some OutTS.

- void `DCM::DeviceControl::SetDefault_PsipEitRegeneration` (in unsigned short Board, in unsigned short NbrOfTables) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the default number of regenerated PSIP-EIT subtables.

- void `DCM::DeviceControl::GetDefault_PsipEitRegeneration` (in unsigned short Board, out unsigned short NbrOfTables) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the default number of regenerated PSIP-EIT subtables.

- void `DCM::DeviceControl::SetDefault_PsipEttRegeneration` (in unsigned short Board, in unsigned short NbrOfTables) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the default number of regenerated PSIP-ETT subtables.

- void [DCM::DeviceControl::GetDefault_PsipEttRegeneration](#) (in unsigned short Board, out unsigned short NbrOfTables) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the default number of regenerated PSIP-ETT subtables.

- void [DCM::DeviceControl::SetPsipEitRegeneration](#) (in IPS_RefTS_t RefTs, in Svc_PsipEitRegeneration-InfoList_t PsipEitRegenerationInfoList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set Output Service PSIP-EIT Regeneration info.

- Svc_PsipEitRegenerationInfoList_t [DCM::DeviceControl::GetPsipEitRegeneration](#) (in IPS_RefTS_t RefTs, in ServiceIdList_t SidList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get Output Service PSIP-EIT Regeneration info.

- void [DCM::DeviceControl::SetPsipEttRegeneration](#) (in IPS_RefTS_t RefTs, in Svc_PsipEttRegeneration-InfoList_t PsipEttRegenerationInfoList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set Output Service PSIP-ETT Regeneration info.

- Svc_PsipEttRegenerationInfoList_t [DCM::DeviceControl::GetPsipEttRegeneration](#) (in IPS_RefTS_t RefTs, in ServiceIdList_t SidList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get Output Service PSIP-ETT Regeneration info.

- void [DCM::DeviceControl::SetDefaultPsipEttvPid](#) (in unsigned short Board, in unsigned short Pid) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the default output PSIP-ETTV PID.

- void [DCM::DeviceControl::GetDefaultPsipEttvPid](#) (in unsigned short Board, out unsigned short Pid) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the default output PSIP-ETTV PID.

- void [DCM::DeviceControl::OutTS_PsipEttvPid_SetL](#) (in IPS_Ref_t RefPhys, in OutTS_PsipEttvPid_List_t PidList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set Output TS PSIP-ETTV PID for some OutTS.

- void [DCM::DeviceControl::OutTS_PsipEttvPid_GetL](#) (in IPS_Ref_t RefPhys, in IPS_RefTS_List_t RefTsList, out OutTS_PsipEttvPid_List_t PidList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get Output TS PSIP-ETTV PID for some OutTS.

- void [DCM::DeviceControl::ETTV_OutputData_SetL](#) (in IPS_RefTS_t RefTS, in ETTV_Content-Setting_List_t lst) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set Output Data for PSIP-ETTV.

- ETTV_ContentData_List_t [DCM::DeviceControl::ETTV_OutputData_GetL](#) (in IPS_RefTS_t RefTS, in ServiceIdList_t SidList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get Output Data for PSIP-ETTV.

- TS_PsipMgtInfoList_t [DCM::DeviceControl::OutTS_MgtInventory_GetL](#) (in IPS_Ref_t RefPhys, in IPS_RefTS_List_t RefTsList, in unsigned long TableId) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get PSIP-MGT TS inventory at the output This will give you a list of all PSIP tables which are available.

- TS_PsipMgtInfoList_t [DCM::DeviceControl::InTS_MgtInventory_GetL](#) (in IPS_Ref_t RefPhys, in IPS_RefTS_List_t RefTsList, in unsigned long TableId) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get PSIP-MGT TS inventory at the input For more information, see OutTS_MgtInventory_GetL.

Variables

- const unsigned short [DCM::DeviceControl::PSIP_REGENERATION_FOLLOW_INPUT](#) = 0xffff
Number of tables follows input.

8.17.1 Detailed Description

This module contains types, enums and methods related to ATSC PSIP (Program and System Information Protocol)

8.17.2 Typedef Documentation

8.17.2.1 typedef sequence<ETTV_ContentData_t> DCM::DeviceControl::ETTV_ContentData_List_t

A sequence of [ETTV_ContentData_t](#).

Definition at line 9660 of file DCM.idl.

8.17.2.2 typedef sequence< ETTV_ContentSetting_t > DCM::DeviceControl::ETTV_ContentSetting_List_t

A sequence of [ETTV_ContentSetting_t](#).

Definition at line 9648 of file DCM.idl.

8.17.2.3 typedef sequence<MultipleStringElement_t> DCM::DeviceControl::MultipleString_t

Definition at line 8840 of file DCM.idl.

8.17.2.4 typedef sequence<OutTS_PsipEitStartPid_t> DCM::DeviceControl::OutTS_PsipEitStartPid_List_t

Definition at line 9287 of file DCM.idl.

8.17.2.5 typedef sequence<OutTS_PsipEttStartPid_t> DCM::DeviceControl::OutTS_PsipEttStartPid_List_t

Definition at line 9295 of file DCM.idl.

8.17.2.6 typedef sequence< OutTS_PsipEttvPid_t > DCM::DeviceControl::OutTS_PsipEttvPid_List_t

Definition at line 9577 of file DCM.idl.

8.17.2.7 typedef sequence<OutTS_SttTimeZone_t> DCM::DeviceControl::OutTS_SttTimeZone_List_t

A sequence of [OutTS_SttTimeZone_t](#).

Definition at line 8970 of file DCM.idl.

8.17.2.8 typedef sequence<OutTsServiceLocationAdded_t> DCM::DeviceControl::OutTsService-LocationAddedList_t

Definition at line 9215 of file DCM.idl.

8.17.2.9 typedef sequence<OutTsStandard_t> DCM::DeviceControl::OutTsStandardList_t

A sequence of [OutTsStandard_t](#).

Definition at line 8888 of file DCM.idl.

8.17.2.10 typedef sequence<PsipMgtInfo_t> DCM::DeviceControl::PsipMgtInfoList_t

Definition at line 9702 of file DCM.idl.

8.17.2.11 typedef sequence<Svc_PsipEitRegenerationInfo_t> DCM::DeviceControl::Svc_PsipEitRegenerationInfoList_t

A sequence of [Svc_PsipEitRegenerationInfo_t](#).

Definition at line 9487 of file DCM.idl.

8.17.2.12 typedef sequence<Svc_PsipEttRegenerationInfo_t> DCM::DeviceControl::Svc_PsipEttRegenerationInfoList_t

A sequence of [Svc_PsipEttRegenerationInfo_t](#).

Definition at line 9499 of file DCM.idl.

8.17.2.13 typedef sequence<TS_PsipMgtInfo_t> DCM::DeviceControl::TS_PsipMgtInfoList_t

Definition at line 9710 of file DCM.idl.

8.17.2.14 typedef sequence<VCT_SvcData_t> DCM::DeviceControl::VCT_SvcData_List_t

A sequence of [VCT_Data_t](#).

Definition at line 9127 of file DCM.idl.

8.17.2.15 typedef sequence<VCT_SvcInput_t> DCM::DeviceControl::VCT_SvcInput_List_t

A sequence of [VCT_SvcInput_t](#).

Definition at line 9076 of file DCM.idl.

8.17.2.16 typedef sequence<VCT_SvcSetting_t> DCM::DeviceControl::VCT_SvcSetting_List_t

A sequence of [VCT_Setting_t](#).

Definition at line 9115 of file DCM.idl.

8.17.3 Enumeration Type Documentation**8.17.3.1 enum DCM::DeviceControl::eTableStandard_t**

Transport Stream standard to guide generation (and display) of output tables.

This enum is added for PSIP support.

Enumerator:

eTableStandardAll

eTableStandardMPEG2 (PAT, CAT and PMT only)

eTableStandardDVB

eTableStandardATSC Support for PSIP.

Definition at line 8845 of file DCM.idl.

8.17.3.2 enum DCM::DeviceControl::eTriBool

Enumerator:

eTB_Transparent

eTB_False

eTB_True

Definition at line 9012 of file DCM.idl.

8.17.3.3 enum DCM::DeviceControl::eVctEtmLocation

Enumerator:

eVctEtmLocation_Transparent

eVctEtmLocation_NoEtm

eVctEtmLocation_InternalEtm

eVctEtmLocation_ExternalEtm

Definition at line 9029 of file DCM.idl.

8.17.3.4 enum DCM::DeviceControl::eVctModulation

Enumerator:

eVctModulationMode_Transparent

eVctModulationMode_Analog

eVctModulationMode_Qam64

eVctModulationMode_Qam256

eVctModulationMode_Vsb8

eVctModulationMode_Vsb16

Definition at line 9019 of file DCM.idl.

8.17.3.5 enum DCM::DeviceControl::eVctServiceType

Enumerator:

eVctServiceType_Transparent

eVctServiceType_Analog

eVctServiceType_Digital_television

eVctServiceType_Digital_audio

eVctServiceType_Digital_data

Definition at line 9037 of file DCM.idl.

8.17.4 Function Documentation

8.17.4.1 `VCT_SvcData_List_t DCM::DeviceControl::CVCT_OutputData_GetL ( in IPS_RefTS_t RefTS, in ServiceIdList_t SidList )` raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get CVCT data (settings and input) for some output services.

Parameters

in	<i>RefTS</i>	The OutTS the services belong to.
in	<i>SidList</i>	List of ServiceId's for which to return the VCT_Data. Empty list means all Services of the TS. Invalid TS: all Services of the port. Invalid Port and TS: all services of the board.

Returns

VCT_SvcData_List_t List of Service/VCT-data pairs

Exceptions

<i>OpNotSupported</i>	When called for main board.
<i>OpNotSucceeded</i>	In case of • RefTs not valid or does not exist. • no ServiceId's found for in the TS.

Version

Release 6.0 (PSIP)

8.17.4.2 `void DCM::DeviceControl::CVCT_OutputData_SetL ( in IPS_RefTS_t RefTS, in VCT_SvcSetting_List_t lst )` raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set CVCT settings for some output services.

Parameters

in	<i>RefTS</i>	The OutTS the services belong to.
out	<i>lst</i>	List of Services with its settings. An empty list is not allowed

Exceptions

<i>OpNotSupported</i>	When called for main board.
<i>OpNotSucceeded</i>	In case of • RefTs does not exist. • an empty list is passed. • a ServiceId is not found for in the TS. • a RefSvc doesn't match RefTS • invalid settings are given

Version

Release 6.0 (PSIP)

8.17.4.3 void DCM::DeviceControl::CVCT_ServiceLocationAddedGetL (in IPS_Ref_t *RefPhys*, in IPS_RefTS_List_t *RefTsList*, out OutTsServiceLocationAddedList_t *AddedList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get per TS whether the service location descriptor must be added per CVCT fragment.

Parameters

in	<i>RefPhys</i>	The port the OutTS are attached to.
in	<i>RefTsList</i>	List of References of OutTs for which to return the OutTsStandard_t - Settings. Empty list equals all OutTs attached to RefPhys.
out	<i>AddedList</i>	List of RefTs/boolean pairs

Exceptions

<i>OpNotSupported</i>	When called for main board.
<i>OpNotSucceeded</i>	In case of • RefTs does not exist or is not an output TS. • RefPhys does not exist or is not an output Port.

Version

Release 6.0 (PSIP)

8.17.4.4 void DCM::DeviceControl::CVCT_ServiceLocationAddedSetL (in IPS_Ref_t *RefPhys*, in OutTsServiceLocationAddedList_t *AddedList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set per TS whether the service location descriptor must be added per CVCT fragment.

Parameters

in	<i>RefPhys</i>	The port the OutTS are attached to.
in	<i>AddedList</i>	List of RefTs/boolean pairs

Exceptions

<i>OpNotSupported</i>	When called for main board.
<i>OpNotSucceeded</i>	In case of • RefPhys does not exist or is not an output Port. • RefTs does not match RefPhys or does not exist.

Version

Release 6.0 (PSIP)

8.17.4.5 ETTV_ContentData_List_t DCM::DeviceControl::ETTV_OutputData_GetL (in IPS_RefTS_t *RefTS*, in ServiceIdList_t *SidList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get Output Data for PSIP-ETTV.

Parameters

in	<i>RefTS</i>	The TS the Services are attached to.
in	<i>SidList</i>	list of services.

Returns

ETTV_ContentData_List_t.

Exceptions

<i>OpNotSupported</i>	when BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case the • RefTS does not exist. • RefServ does not match RefTS.

Version

Release 6.5

8.17.4.6 void DCM::DeviceControl::ETTV_OutputData_SetL (in IPS_RefTS_t *RefTS*, in ETTV_ContentSetting_List_t *lst*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set Output Data for PSIP-ETTV.

Parameters

in	<i>RefTS</i>	The TS the Services are attached to.
in	<i>lst</i>	List of RefServ/Content/Forcing.

Exceptions

<i>OpNotSupported</i>	when BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case the • RefTS does not exist. • Invalid values in the content. • RefServ does not match RefTS.

Version

Release 6.5

8.17.4.7 void DCM::DeviceControl::GetDefault_PsipEitRegeneration (in unsigned short *Board*, out unsigned short *NbrOfTables*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the default number of regenerated PSIP-EIT subtables.

Parameters

in	<i>Board</i>	specifies BoardNr.
out	<i>NbrOfTables</i>	The current setting of the board default PSIP-EIT regeneration. Can be PSIP_REGENERATION_FOLLOW_INPUT.

Exceptions

<i>OpNotSupported</i>	when BoardNr = 0 = Main board.
-----------------------	--------------------------------

Version

Release 6.0

8.17.4.8 void DCM::DeviceControl::GetDefault_PsipEitStartPid (in unsigned short *Board*, out unsigned short *StartPid*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the default output PSIP-EIT start PID.

Parameters

in	<i>Board</i>	specifies BoardNr.
out	<i>StartPid</i>	The current setting of the start PID.

Exceptions

<i>OpNotSupported</i>	when BoardNr = 0 = Main board.
-----------------------	--------------------------------

Version

Release 6.0

8.17.4.9 void DCM::DeviceControl::GetDefault_PsipEttRegeneration (in unsigned short *Board*, out unsigned short *NbrOfTables*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the default number of regenerated PSIP-ETT subtables.

Parameters

in	<i>Board</i>	specifies BoardNr.
out	<i>NbrOfTables</i>	The current setting of the board default PSIP-ETT regeneration. Can be PSIP_REGENERATION_FOLLOW_INPUT.

Exceptions

<i>OpNotSupported</i>	when BoardNr = 0 = Main board.
-----------------------	--------------------------------

Version

Release 6.5

8.17.4.10 void DCM::DeviceControl::GetDefault_PsipEttStartPid (in unsigned short *Board*, out unsigned short *StartPid*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the default output PSIP-ETT start PID.

Parameters

in	<i>Board</i>	specifies BoardNr.
out	<i>StartPid</i>	The current setting of the start PID.

Exceptions

<i>OpNotSupported</i>	when BoardNr = 0 = Main board.
-----------------------	--------------------------------

Version

Release 6.5

8.17.4.11 void DCM::DeviceControl::GetDefaultOutputTsStandard (in unsigned short *Board*, out eTableStandard_t *eStandard*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the default output TS standard.

Parameters

in	<i>Board</i>	specifies BoardNr.
out	<i>eStandard</i>	The current setting.

Exceptions

<i>OpNotSupported</i>	when BoardNr = 0 = Main board.
-----------------------	--------------------------------

Version

release 6.0

8.17.4.12 void DCM::DeviceControl::GetDefaultPsipEttvPid (in unsigned short *Board*, out unsigned short *Pid*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the default output PSIP-ETTV PID.

Parameters

in	<i>Board</i>	specifies BoardNr.
out	<i>Pid</i>	The current setting of the PID.

Exceptions

<i>OpNotSupported</i>	when BoardNr = 0 = Main board.
-----------------------	--------------------------------

Version

Release 6.5

8.17.4.13 void DCM::DeviceControl::GetGpsUtcOffset (in unsigned short *Board*, out unsigned short *Offset*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the GPS-UTC offset.

Parameters

in	<i>Board</i>	The Board for which to retrieve the setting.
out	<i>Offset</i>	The current offset in seconds.

Exceptions

<i>OpNotSupported</i>	When called for main board.
-----------------------	-----------------------------

See also

[SetGpsUtcOffset](#)

Version

Release 6.0 (PSIP)

8.17.4.14 Svc_PsipEitRegenerationInfoList_t DCM::DeviceControl::GetPsipEitRegeneration (in IPS_RefTS_t *RefTs*, in ServiceIdList_t *SidList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get Output Service PSIP-EIT Regeneration info.

Parameters

in	<i>RefTs</i>	The Output TS the services are attached to.
in	<i>SidList</i>	List of Services to return the regeneration settings of.

Returns

Svc_PsipEitRegenerationInfoList_t

Exceptions

<i>OpNotSupported</i>	when BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case the • RefTs not valid or does not exist. • no ServiceId's found for in the TS.

Version

Release 6.0

8.17.4.15 **Svc_PsipEttRegenerationInfoList_t** DCM::DeviceControl::GetPsipEttRegeneration (in IPS_RefTS_t *RefTs*, in ServiceIdList_t *SidList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get Output Service PSIP-ETT Regeneration info.

Parameters

in	<i>RefTs</i>	The Output TS the services are attached to.
in	<i>SidList</i>	List of Services to return the regeneration settings of.

Returns

Svc_PsipEttRegenerationInfoList_t

Exceptions

<i>OpNotSupported</i>	when BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case the • RefTs not valid or does not exist. • no ServiceId's found for in the TS.

Version

Release 6.5

8.17.4.16 **TS_PsipMgtInfoList_t** DCM::DeviceControl::InTS_MgtInventory_GetL (in IPS_Ref_t *RefPhys*, in IPS_RefTS_List_t *RefTsList*, in unsigned long *TableId*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get PSIP-MGT TS inventory at the input For more information, see OutTS_MgtInventory_GetL.

Parameters

in	<i>RefPhys</i>	The port the InTS are attached to.
in	<i>RefTsList</i>	List of References of InTs for which to return the MGT inventory. Empty list means all InTs attached to RefPhys.
in	<i>TableId</i>	Table ID filter, use 0xFFFFFFFF for all tables.

Returns

TS_PsipMgtInfoList_t

Exceptions

<i>OpNotSupported</i>	When called for main board.
<i>OpNotSucceeded</i>	In case of • RefPhys does not exist. • RefTs does not match RefPhys.

See also

OutTS_MgtInventory_GetL

Version

Release 6.0

8.17.4.17 void DCM::DeviceControl::OutputTsStandardGetL (in IPS_Ref_t *RefPhys*,
in IPS_RefTS_List_t *RefTsList*, out OutTsStandardList_t *lst*) raises (TimeOut,
OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get Output TS Standard for some OutTS.

Parameters

in	<i>RefPhys</i>	The port the OutTS are attached to.
in	<i>RefTsList</i>	List of References of OutTs for which to return the OutTsStandard_t - Settings. Empty list equals all OutTs attached to RefPhys.
out	<i>lst</i>	List of RefTs/eTableStandard_t pairs

Exceptions

<i>OpNotSupported</i>	When called for main board.
<i>OpNotSucceeded</i>	In case of • RefPhys does not exist. • RefTs does not match RefPhys

Version

Release 6.0 (PSIP)

8.17.4.18 void DCM::DeviceControl::OutputTsStandardSetL (in IPS_Ref_t *RefPhys*, in
OutTsStandardList_t *lst*) raises (TimeOut, OpNotSucceeded, OpNotAllowed,
OpNotSupported)

Set Output TS Standard for some OutTS.

Parameters

in	<i>RefPhys</i>	The port the OutTS are attached to.
in	<i>lst</i>	List of RefTs/eStandard pairs

Exceptions

<i>OpNotSupported</i>	When called for main board.
<i>OpNotSucceeded</i>	In case of • RefPhys does not exist. • eStandard is invalid. • RefTs does not match RefPhys.

Version

Release 6.0 (PSIP)

8.17.4.19 TS_PsipMgtInfoList.t DCM::DeviceControl::OutTS_MgtInventory_GetL (in IPS_Ref_t *RefPhys*, in IPS_RefTS_List_t *RefTsList*, in unsigned long *TableId*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get PSIP-MGT TS inventory at the output This will give you a list of all PSIP tables which are available.

Tables are only included if they are referenced in the MGT. Tables which are referenced in the MGT are: VCT, EIT, ETT, RRT. You can filter the list by including a Table ID. Only tables with this table ID will be returned. This is useful to retrieve a list of EIT tables or a list of RRT tables. To find out which RRT tables are available, use table ID 0xCA. To get a list of EIT tables, use table ID 0xCB. The Table Type which is returned is a table type as used in the MGT. For EIT, table types range from 0x100 (EIT-0) to 0x17F (EIT-127). For ETT, table types range from 0x200 (ETT-0) to 0x27F (ETT-127). For RRT, table types range from 0x301 (region 1) to 0x3FF (region 255).

Parameters

in	<i>RefPhys</i>	The port the OutTS are attached to.
in	<i>RefTsList</i>	List of References of OutTs for which to return the MGT inventory. - Empty list means all OutTs attached to RefPhys.
in	<i>TableId</i>	Table ID filter, use 0xFFFFFFFF for all tables.

Returns

TS_PsipMgtInfoList_t

Exceptions

<i>OpNotSupported</i>	When called for main board.
<i>OpNotSucceeded</i>	In case of • RefPhys does not exist. • RefTs does not match RefPhys.

Version

Release 6.0

8.17.4.20 void DCM::DeviceControl::OutTS_PsipEitStartPid_GetL (in IPS_Ref_t *RefPhys*, in IPS_RefTS_List_t *RefTsList*, out OutTS_PsipEitStartPidList_t *StartPidList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get Output TS PSIP-EIT start PID for some OutTS.

Parameters

in	<i>RefPhys</i>	The port the OutTS are attached to.
in	<i>RefTsList</i>	List of References of OutTs for which to return the start PID Settings.
out	<i>StartPidList</i>	List start PID / refTS pairs.

Exceptions

<i>OpNotSupported</i>	When called for main board.
<i>OpNotSucceeded</i>	In case of • RefPhys does not exist. • RefTs does not match RefPhys

Version

Release 6.0

8.17.4.21 void DCM::DeviceControl::OutTS_PsipEitStartPid_SetL (in IPS_Ref_t *RefPhys*, in OutTS_PsipEitStartPidList_t *StartPidList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set Output TS PSIP-EIT start PID for some OutTS.

Parameters

in	<i>RefPhys</i>	The port the OutTS are attached to.
in	<i>StartPidList</i>	List of RefTs/OutTS_PsipEitStartPid_t pairs

Exceptions

<i>OpNotSupported</i>	When called for main board.
<i>OpNotSucceeded</i>	In case the • RefPhys does not exist. • StartPid is not in the valid range. [0x0020 - 0x1FFF] • RefTs does not match RefPhys.

Version

Release 6.0

8.17.4.22 void DCM::DeviceControl::OutTS_PsipEttStartPid_GetL (in IPS_Ref_t *RefPhys*, in IPS_RefTS_List_t *RefTsList*, out OutTS_PsipEttStartPidList_t *StartPidList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get Output TS PSIP-ETT start PID for some OutTS.

Parameters

in	<i>RefPhys</i>	The port the OutTS are attached to.
in	<i>RefTsList</i>	List of References of OutTs for which to return the start PID Settings.
out	<i>StartPidList</i>	List start PID / refTS pairs.

Exceptions

<i>OpNotSupported</i>	When called for main board.
<i>OpNotSucceeded</i>	In case of • RefPhys does not exist. • RefTs does not match RefPhys

Version

Release 6.5

8.17.4.23 void DCM::DeviceControl::OutTS_PsipEttStartPid_SetL (in IPS_Ref_t *RefPhys*, in OutTS_PsipEttStartPidList_t *StartPidList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set Output TS PSIP-ETT start PID for some OutTS.

Parameters

in	<i>RefPhys</i>	The port the OutTS are attached to.
in	<i>StartPidList</i>	List of RefTs/OutTS_PsipEttStartPid_t pairs

Exceptions

<i>OpNotSupported</i>	When called for main board.
<i>OpNotSucceeded</i>	In case the • RefPhys does not exist. • StartPid is not in the valid range. [0x0020 - 0x1FFF] • RefTs does not match RefPhys.

Version

Release 6.5

8.17.4.24 void DCM::DeviceControl::OutTS_PsipEttvPid_GetL (in IPS_Ref_t *RefPhys*, in IPS_RefTS_List_t *RefTsList*, out OutTS_PsipEttvPid_List_t *PidList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get Output TS PSIP-ETTV PID for some OutTS.

Parameters

in	<i>RefPhys</i>	The port the OutTS are attached to.
in	<i>RefTsList</i>	List of References of OutTs for which to return the PID Settings.
out	<i>PidList</i>	List of RefTs/PID pairs.

Exceptions

<i>OpNotSupported</i>	When called for main board.
<i>OpNotSucceeded</i>	In case of • RefPhys does not exist. • RefTs does not match RefPhys.

Version

Release 6.5

8.17.4.25 void DCM::DeviceControl::OutTS_PsipEttvPid_SetL (in IPS_Ref_t *RefPhys*, in OutTS_PsipEttvPid_List_t *PidList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set Output TS PSIP-ETTV PID for some OutTS.

Parameters

in	<i>RefPhys</i>	The port the OutTS are attached to.
in	<i>PidList</i>	List of RefTs/PID pairs.

Exceptions

<i>OpNotSupported</i>	when BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case the • RefPhys does not exist. • Pid is not in the valid range [0x0020 - 0x1FFF]. • RefTs does not match RefPhys.

Version

Release 6.5

8.17.4.26 void DCM::DeviceControl::OutTS_SttTimeZone_GetL (in IPS_Ref_t *RefPhys*, in IPS_RefTS_List_t *RefTsList*, out OutTS_SttTimeZone_List_t *lst*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get STT time zone for some OutTS.

The time zone is used to calculate the DST fields in the STT. The format of the time zone string is the same as for TOT. An empty string means: Follow the DCM's local time zone. The default is an empty string.

Parameters

in	<i>RefPhys</i>	The port the OutTS are attached to.
in	<i>RefTsList</i>	List of References of OutTs for which to return the STT time zone - Settings. Empty list means all OutTS attached to RefPhys.
out	<i>lst</i>	List of RefTs/time zone pairs

Exceptions

<i>OpNotSupported</i>	When called for main board.
<i>OpNotSucceeded</i>	In case of • RefPhys does not exist. • RefTs does not match RefPhys.

Version

Release 6.0 (PSIP)

8.17.4.27 void DCM::DeviceControl::OutTS_SttTimeZone_SetL (in IPS_Ref_t *RefPhys*, in OutTS_SttTimeZone_List_t *lst*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set STT time zone for some OutTS.

The time zone is used to calculate the DST fields in the STT. The format of the time zone string is the same as for TOT. An empty string means: Follow the DCM's local time zone. The default is an empty string.

Parameters

in	<i>RefPhys</i>	The port the OutTS are attached to.
in	<i>lst</i>	List of RefTs / time zone pairs

Exceptions

<i>OpNotSupported</i>	When called for main board.
<i>OpNotSucceeded</i>	In case of • RefPhys does not exist. • RefTs does not match RefPhys.

Version

Release 6.0 (PSIP)

8.17.4.28 void DCM::DeviceControl::SetDefault_PsipEitRegeneration (in unsigned short *Board*, in unsigned short *NbrOfTables*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the default number of regenerated PSIP-EIT subtables.

Parameters

in	<i>Board</i>	specifies BoardNr.
in	<i>NbrOfTables</i>	specifies the new default. Use of PSIP_REGENERATION_FOLLOW_INPUT is allowed.

Exceptions

<i>OpNotSupported</i>	when BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	in case NbrOfTables is not in the valid range. The valid range is equal to [0,128]

Version

release 6.0

8.17.4.29 void DCM::DeviceControl::SetDefault_PsipEitStartPid (in unsigned short *Board*, in unsigned short *StartPid*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the default output PSIP-EIT start PID.

Parameters

in	<i>Board</i>	specifies BoardNr.
in	<i>StartPid</i>	specifies the new default.

Exceptions

<i>OpNotSupported</i>	when BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	in case the given start PID is not in range for a valid PSIP-EIT start PID [0x0020 - 0x1FFF]

Version

Release 6.0

8.17.4.30 void DCM::DeviceControl::SetDefault_PsipEttRegeneration (in unsigned short *Board*, in unsigned short *NbrOfTables*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the default number of regenerated PSIP-ETT subtables.

Parameters

in	<i>Board</i>	specifies BoardNr.
in	<i>NbrOfTables</i>	specifies the new default. Use of PSIP_REGENERATION_FOLLOW_INPUT is allowed.

Exceptions

<i>OpNotSupported</i>	when BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	in case NbrOfTables is not in the valid range. The valid range is equal to [0,128]

Version

release 6.5

8.17.4.31 void DCM::DeviceControl::SetDefault_PsipEttStartPid (in unsigned short *Board*, in unsigned short *StartPid*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the default output PSIP-ETT start PID.

Parameters

in	<i>Board</i>	specifies BoardNr.
in	<i>StartPid</i>	specifies the new default.

Exceptions

<i>OpNotSupported</i>	when BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	in case the given start PID is not in range for a valid PSIP-ETT start PID [0x0020 - 0x1FFF]

Version

Release 6.5

8.17.4.32 void DCM::DeviceControl::SetDefaultOutputTsStandard (in unsigned short *Board*, in eTableStandard_t *eNew*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the default output TS standard.

Parameters

in	<i>Board</i>	specifies BoardNr.
in	<i>eNew</i>	specifies the new default.

Exceptions

<i>OpNotSupported</i>	when BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	in case eNew is not in range for a valid eTableStandard_t.

Version

release 6.0

8.17.4.33 void DCM::DeviceControl::SetDefaultPsisEttvPid (in unsigned short *Board*, in unsigned short *Pid*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the default output PSIP-ETTV PID.

Parameters

in	<i>Board</i>	specifies BoardNr.
in	<i>Pid</i>	specifies the new default.

Exceptions

<i>OpNotSupported</i>	when BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	in case the given PID is not in range for a valid PSIP-ETTV PID [0x0020 - 0x1FFF]

Version

Release 6.5

8.17.4.34 void DCM::DeviceControl::SetGpsUtcOffset (in unsigned short *Board*, in unsigned short *Offset*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the GPS-UTC offset.

The GPS-UTC offset is the current offset in whole seconds between GPS and UTC time standards. To convert GPS time to UTC, this offset is subtracted from the GPS time. Whenever the National Bureau of Weights and Measures decides that the current offset is too far in error, an additional leap second may be added. When this happens, you should update your DCM to reflect this. The default value at the time of DCM release 6.0 is 15. This is a board level setting. To update the configuration, you have to call this function on every I/O board of the DCM.

This setting is used for generating the PSIP STT.

Parameters

in	<i>Board</i>	The Board for which to change the setting.
in	<i>Offset</i>	The new offset in seconds.

Exceptions

<i>OpNotSupported</i>	When called for main board.
-----------------------	-----------------------------

Version

Release 6.0 (PSIP)

8.17.4.35 void DCM::DeviceControl::SetPsipEitRegeneration (in IPS_RefTS_t *RefTs*, in Svc_PsipEitRegenerationInfoList_t *PsipEitRegenerationInfoList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set Output Service PSIP-EIT Regeneration info.

Parameters

in	<i>RefTs</i>	The Output TS the services are attached to.
in	<i>PsipEit-Regeneration-InfoList</i>	List with settings to apply

Exceptions

<i>OpNotSupported</i>	when BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case of • RefTs does not exist. • an empty list is passed. • a ServiceId is not found in the TS. • a RefSvc doesn't match RefTS • the given setting is not in the range of a valid number of regenerated PSIP-EIT tables. The valid range is equal to [0,128]

Version

Release 6.0

8.17.4.36 void DCM::DeviceControl::SetPsipEttRegeneration (in IPS_RefTS_t *RefTs*, in Svc_PsipEttRegenerationInfoList_t *PsipEttRegenerationInfoList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set Output Service PSIP-ETT Regeneration info.

Parameters

in	<i>RefTs</i>	The Output TS the services are attached to.
in	<i>PsipEtt-Regeneration-InfoList</i>	List with settings to apply

Exceptions

<i>OpNotSupported</i>	when BoardNr = 0 = Main board.
<i>OpNotSucceeded</i>	In case of • RefTs does not exist. • an empty list is passed. • a ServiceId is not found in the TS. • a RefSvc doesn't match RefTS • the given setting is not in the range of a valid number of regenerated PSIP-E-TT tables. The valid range is equal to [0,128]

Version

Release 6.5

8.17.4.37 `VCT_SvcData_List_t DCM::DeviceControl::TVCT_OutputData_GetL ( in IPS_RefTS_t RefTS, in ServiceIdList_t SidList )` raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get TVCT data (settings and input) for some output services.

Parameters

in	<i>RefTS</i>	The OutTS the services belong to.
in	<i>SidList</i>	List of ServiceId's for which to return the VCT_Data. Empty list means all Services of the TS. Invalid TS: all Services of the port. Invalid Port and TS: all services of the board.

Returns

VCT_SvcData_List_t List of Service/VCT-data pairs

Exceptions

<i>OpNotSupported</i>	When called for main board.
<i>OpNotSucceeded</i>	In case of • RefTs not valid or does not exist. • no ServiceId's found for in the TS.

Version

Release 6.0 (PSIP)

8.17.4.38 `void DCM::DeviceControl::TVCT_OutputData_SetL ( in IPS_RefTS_t RefTS, in VCT_SvcSetting_List_t lst )` raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set TVCT settings for some output services.

Parameters

in	<i>RefTS</i>	The OutTS the services belong to.
out	<i>lst</i>	List of Services with its settings. An empty list is not allowed

Exceptions

<i>OpNotSupported</i>	When called for main board.
<i>OpNotSucceeded</i>	In case of • RefTs does not exist. • an empty list is passed. • a ServiceId is not found for in the TS. • a RefSvc doesn't match RefTS • invalid settings are given

Version

Release 6.0 (PSIP)

8.17.4.39 void DCM::DeviceControl::TVCT_ServiceLocationAddedGetL (in IPS_Ref_t *RefPhys*, in IPS_RefTS_List_t *RefTsList*, out OutTsServiceLocationAddedList_t *AddedList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get per TS whether the service location descriptor must be added per TVCT fragment.

Parameters

in	<i>RefPhys</i>	The port the OutTS are attached to.
in	<i>RefTsList</i>	List of References of OutTs for which to return the ServiceLocation-Added Settings. Empty list equals all OutTs attached to RefPhys.
out	<i>AddedList</i>	List of RefTs/boolean pairs

Exceptions

<i>OpNotSupported</i>	When called for main board.
<i>OpNotSucceeded</i>	In case of • RefTs does not exist or is not an output TS. • RefPhys does not exist or is not an output Port.

Version

Release 6.0 (PSIP)

8.17.4.40 void DCM::DeviceControl::TVCT_ServiceLocationAddedSetL (in IPS_Ref_t *RefPhys*, in OutTsServiceLocationAddedList_t *AddedList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set per TS whether the service location descriptor must be added per TVCT fragment.

Parameters

in	<i>RefPhys</i>	The port the OutTS are attached to.
in	<i>AddedList</i>	List of RefTs/boolean pairs

Exceptions

<i>OpNotSupported</i>	When called for main board.
<i>OpNotSucceeded</i>	In case of • RefPhys does not exist or is not an output Port. • RefTs does not match RefPhys or does not exist.

Version

Release 6.0 (PSIP)

8.17.4.41 *VCT_SvcInput_List_t* DCM::DeviceControl::VCT_InputData_GetL (in *IPS_RefTS_t RefTS*, in *ServiceIdList_t SidList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get VCT data for some input services.

Parameters

in	<i>RefTS</i>	The InputTS the services belong to.
in	<i>SidList</i>	List of ServiceId's for which to return the VCT_Data. Empty list: all Services of the TS. Invalid TS: all Services of the port. Invalid Port and TS: all services of the board.

Returns

VCT_SvcInput_List_t List of Service/VCT-data pairs

Exceptions

<i>OpNotSupported</i>	When called for main board.
<i>OpNotSucceeded</i>	In case of • RefTs not valid or does not exist. • no ServiceId's found in the TS.

Version

Release 6.0 (PSIP)

8.17.5 Variable Documentation

8.17.5.1 `const unsigned short DCM::DeviceControl::PSIP_REGENERATION_FOLLOW_INPUT = 0xffff`

Number of tables follows input.

Version

release 8.9

Definition at line 9300 of file DCM.idl.

8.18 Bitrate

This module contains types, enums and methods related to bitrate measurements.

Classes

- struct [DCM::DeviceControl::BitRateMeasurement_t](#)
General structure to hold bitrate measurement data.
- struct [DCM::DeviceControl::TS_BitRateMeasurement_t](#)
- struct [DCM::DeviceControl::ServiceBitRateMeasurement_t](#)
- struct [DCM::DeviceControl::TS_CompBitRateMeasurement_t](#)
- struct [DCM::DeviceControl::ServiceCompBitRateMeasurement_t](#)
- struct [DCM::DeviceControl::ServiceBitRateSample_t](#)
- struct [DCM::DeviceControl::TRBitRateSample_t](#)
- struct [DCM::DeviceControl::TR_BitRateMeasurement_t](#)

Typedefs

- typedef sequence < [TS_BitRateMeasurement_t](#) > [DCM::DeviceControl::TS_BitRateMeasurementList_t](#)
A sequence of [TS_BitRateMeasurement_t](#).
- typedef sequence < [ServiceBitRateMeasurement_t](#) > [DCM::DeviceControl::ServiceBitRateMeasurementList_t](#)
A sequence of [ServiceBitRateMeasurement_t](#).
- typedef sequence < [TS_CompBitRateMeasurement_t](#) > [DCM::DeviceControl::TS_CompBitRateMeasurementList_t](#)
A sequence of [TS_CompBitRateMeasurement_t](#).
- typedef sequence < [ServiceCompBitRateMeasurement_t](#) > [DCM::DeviceControl::ServiceCompBitRateMeasurementList_t](#)
A sequence of [ServiceCompBitRateMeasurement_t](#).
- typedef sequence< unsigned long > [DCM::DeviceControl::BitRateSampleList_t](#)
A sequence of longs.
- typedef sequence < [ServiceBitRateSample_t](#) > [DCM::DeviceControl::ServiceBitRateSampleList_t](#)
A sequence of [ServiceBitRateSample_t](#).
- typedef sequence < [TRBitRateSample_t](#) > [DCM::DeviceControl::TRBitRateSampleList_t](#)
A sequence of [TRBitRateSample_t](#).
- typedef sequence < [TR_BitRateMeasurement_t](#) > [DCM::DeviceControl::TR_BitRateMeasurementList_t](#)
A sequence of [TR_BitRateMeasurement_t](#).

Functions

- [TS_BitRateMeasurementList_t](#) [DCM::DeviceControl::MM_GetInputTS_BitRate](#) (in [IPS_RefTS_t](#) - [RefTS](#)) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get the bitrate information of incoming TS.
- [TS_BitRateMeasurementList_t](#) [DCM::DeviceControl::MM_GetOutputTS_BitRate](#) (in [IPS_RefTS_t](#) - [RefTS](#)) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the bitrate information of outgoing TS.

- ServiceBitRateMeasurementList_t [DCM::DeviceControl::MM_GetInputTS_ServiceBitRate](#) (in IPS_RefTS_t RefTS) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the service bitrate information of incoming services.

- ServiceBitRateMeasurementList_t [DCM::DeviceControl::MM_GetOutputTS_ServiceBitRate](#) (in IPS_RefTS_t RefTS) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the service bitrate information of outgoing services.

- TS_CompBitRateMeasurementList_t [DCM::DeviceControl::MM_GetInputTS_ComponentBitRate](#) (in IPS_RefTS_t RefTS) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the component bitrate information of incoming TS's.

- TS_CompBitRateMeasurementList_t [DCM::DeviceControl::MM_GetOutputTS_ComponentBitRate](#) (in IPS_RefTS_t RefTS) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the component bitrate information of outgoing TS's.

- ServiceCompBitRateMeasurementList_t [DCM::DeviceControl::MM_GetInputSvcComponentBitRate](#) (in IPS_RefTS_t RefTS, in ServiceIdList_t lstServices) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the component bitrate information of incoming services.

- ServiceCompBitRateMeasurementList_t [DCM::DeviceControl::MM_GetOutputSvcComponentBitRate](#) (in IPS_RefTS_t RefTS, in ServiceIdList_t lstServices) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the component bitrate information of outgoing services.

- void [DCM::DeviceControl::MM_GetTR_GroupBitRate](#) (in IPS_Ref_t PhysRef, in unsigned long GroupID, out ServiceBitRateSampleList_t InputServiceBitRate, out ServiceBitRateSampleList_t - OutputServiceBitRate, out TRBitRateSample_t OutputGroupBitRate) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the bitrate information of transrated services.

- void [DCM::DeviceControl::MM_ResetTS_BitRate](#) (in IPS_RefTS_t RefTS, in boolean bInput) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Reset bitrate counters.

8.18.1 Detailed Description

This module contains types, enums and methods related to bitrate measurements.

8.18.2 Typedef Documentation

8.18.2.1 typedef sequence<unsigned long> DCM::DeviceControl::BitRateSampleList_t

A sequence of longs.

Note

We've abandoned the idea to add an extra timer index. By sending 150 samples each time zeroes will indicate missing measurements.

Definition at line 9835 of file DCM.idl.

8.18.2.2 typedef sequence<ServiceBitRateMeasurement_t> DCM::DeviceControl::ServiceBitRateMeasurementList_t

A sequence of [ServiceBitRateMeasurement_t](#).

Definition at line 9804 of file DCM.idl.

8.18.2.3 `typedef sequence<ServiceBitRateSample_t> DCM::DeviceControl::ServiceBitRateSampleList_t`

A sequence of [ServiceBitRateSample_t](#).

Definition at line 9844 of file DCM.idl.

8.18.2.4 `typedef sequence<ServiceCompBitRateMeasurement_t> DCM::DeviceControl::ServiceCompBitRateMeasurementList_t`

A sequence of [ServiceCompBitRateMeasurement_t](#).

Definition at line 9828 of file DCM.idl.

8.18.2.5 `typedef sequence<TR_BitRateMeasurement_t> DCM::DeviceControl::TR_BitRateMeasurementList_t`

A sequence of [TR_BitRateMeasurement_t](#).

Definition at line 9865 of file DCM.idl.

8.18.2.6 `typedef sequence<TRBitRateSample_t> DCM::DeviceControl::TRBitRateSampleList_t`

A sequence of [TRBitRateSample_t](#).

Definition at line 9854 of file DCM.idl.

8.18.2.7 `typedef sequence<TS_BitRateMeasurement_t> DCM::DeviceControl::TS_BitRateMeasurementList_t`

A sequence of [TS_BitRateMeasurement_t](#).

Definition at line 9795 of file DCM.idl.

8.18.2.8 `typedef sequence<TS_CompBitRateMeasurement_t> DCM::DeviceControl::TS_CompBitRateMeasurementList_t`

A sequence of [TS_CompBitRateMeasurement_t](#).

Definition at line 9815 of file DCM.idl.

8.18.3 Function Documentation

8.18.3.1 `ServiceCompBitRateMeasurementList_t DCM::DeviceControl::MM_GetInputSvcComponentBitRate ( in IPS_RefTS_t RefTS, in ServiceIdList_t IstServices )` raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the component bitrate information of incoming services.

Parameters

<code>in</code>	<i>RefTS</i>	Specifies BoardNr, PortNr & Ref to get the bitrates of.
<code>in</code>	<i>IstServices</i>	A list of service ID's. An empty list means all services.

Returns

`ServiceCompBitRateMeasurementList_t` A list of [ServiceCompBitRateMeasurement_t](#) holding the requested bitrate information.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main Board.
<i>OpNotSucceeded</i>	In case invalid PhysRef (board or port) are used.

Note

- The value 0xFFFF for PortNr and the value 0xFFFFFFFF for Ref means search all InputPorts for all TSs to find the service bitrates of the IstServices. If the IstServices is empty all input service bitrates of the board will be returned.
- The value 0xFFFF for PortNr and a valid Ref means search all InputPorts to find the TSref to get the service bitrates of the IstServices. If the IstServices is empty all input service bitrates of the TSref will be returned.
- A valid PortNr and the value 0xFFFFFFFF for Ref means search all TSs on the Port for the service bitrates of the IstServices. If the IstServices is empty all input service bitrates of the InputPort will be returned.
- In case the board and port are valid and the Ref is invalid (and != 0xFFFFFFFF) an empty list will be returned.

8.18.3.2 TS_BitRateMeasurementList_t DCM::DeviceControl::MM_GetInputTS_BitRate (in IPS_RefTS_t RefTS) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the bitrate information of incoming TS.

Parameters

in	RefTS	Specifies BoardNr, PortNr & Ref to get the bitrates of.
----	-------	---

Returns

TS_BitRateMeasurementList_t A list of [TS_BitRateMeasurement_t](#) holding the requested bitrate information.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main Board.
<i>OpNotSucceeded</i>	In case invalid PhysRef (board or port) are used.

Note

- The value 0xFFFF for PortNr and the value 0xFFFFFFFF for Ref means get the bitrate information of all TS on all InputPorts.
- The value 0xFFFF for PortNr and a valid Ref means search all InputPorts to find the TSref to get the bitrate from.
- A valid PortNr and the value 0xFFFFFFFF for Ref means get the bitrate information of all TSs on the specified InputPort.
- In case the board and port are valid and the Ref is invalid (and != 0xFFFFFFFF) an empty list will be returned.

8.18.3.3 TS_CompBitRateMeasurementList_t DCM::DeviceControl::MM_GetInputTS_Component-BitRate (in IPS_RefTS_t RefTS) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the component bitrate information of incoming TS's.

Parameters

in	RefTS	Specifies BoardNr, PortNr & Ref to get the bitrates of.
----	-------	---

Returns

TS_CompBitRateMeasurementList_t A list of [TS_CompBitRateMeasurement_t](#) holding the requested bitrate information.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main Board.
<i>OpNotSucceeded</i>	In case invalid PhysRef (board or port) are used.

Note

- The value 0xFFFF for PortNr and the value 0xFFFFFFFF for Ref means get the bitrate information of all TScomponents of all TSs on all InputPorts.
- The value 0xFFFF for PortNr and a valid Ref means search all OutputPorts to find the TSref to get the TScomponent bitrates from.
- A valid PortNr and the value 0xFFFFFFFF for Ref means get the bitrate information of all the TSComponents of all the TSs on the specified InputPort.
- In case the board and port are valid and the Ref is invalid (and != 0xFFFFFFFF) an empty list will be returned.

8.18.3.4 ServiceBitRateMeasurementList_t DCM::DeviceControl::MM_GetInputTS_ServiceBitRate (in IPS_RefTS_t RefTS) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the service bitrate information of incoming services.

Parameters

in	RefTS	Specifies BoardNr, PortNr & Ref to get the bitrates of.
----	-------	---

Returns

ServiceBitRateMeasurementList_t A list of [ServiceBitRateMeasurement_t](#) holding the requested bitrate information.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main Board.
<i>OpNotSucceeded</i>	In case invalid PhysRef (board or port) are used.

Note

- The value 0xFFFF for PortNr and the value 0xFFFFFFFF for Ref means get the bitrate information of all services of all TSs on all InputPorts.
- The value 0xFFFF for PortNr and a valid Ref means search all InputPorts to find the TSref to get the service bitrates from.
- A valid PortNr and the value 0xFFFFFFFF for Ref means get the bitrate information of all the services of all the TSs on the specified InputPort.
- In case the board and port are valid and the Ref is invalid (and != 0xFFFFFFFF) an empty list will be returned.

8.18.3.5 ServiceCompBitRateMeasurementList_t DCM::DeviceControl::MM_GetOutputSvc-ComponentBitRate (in IPS_RefTS_t *RefTS*, in ServiceIdList_t *lstServices*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the component bitrate information of outgoing services.

Parameters

in	<i>RefTS</i>	Specifies BoardNr, PortNr & Ref to get the bitrates of.
in	<i>lstServices</i>	A list of service ID's. An empty list means all services.

Returns

ServiceCompBitRateMeasurementList_t A list of [ServiceCompBitRateMeasurement_t](#) holding the requested bitrate information.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main Board.
<i>OpNotSucceeded</i>	In case invalid PhysRef (board or port) are used.

Note

- The value 0xFFFF for PortNr and the value 0xFFFFFFFF for Ref means search all OutputPorts for all TSs to find the service bitrates of the lstServices. If the lstServices is empty all output service bitrates of the board will be returned.
- The value 0xFFFF for PortNr and a valid Ref means search all OutputPorts to find the TSref to get the service bitrates of the lstServices. If the lstServices is empty all output service bitrates of the TSref will be returned.
- A valid PortNr and the value 0xFFFFFFFF for Ref means search all TSs on the Port for the service bitrates of the lstServices. If the lstServices is empty all output service bitrates of the OutputPort will be returned.
- In case the board and port are valid and the Ref is invalid (and != 0xFFFFFFFF) an empty list will be returned.

8.18.3.6 TS_BitRateMeasurementList_t DCM::DeviceControl::MM_GetOutputTS_BitRate (in IPS_RefTS_t *RefTS*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the bitrate information of outgoing TS.

Parameters

in	<i>RefTS</i>	Specifies BoardNr, PortNr & Ref to get the bitrates of.
----	--------------	---

Returns

TS_BitRateMeasurementList_t A list of [TS_BitRateMeasurement_t](#) holding the requested bitrate information.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main Board.
<i>OpNotSucceeded</i>	In case invalid PhysRef (board or port) are used.

Note

- The value 0xFFFF for PortNr and the value 0xFFFFFFFF for Ref means get the bitrate information of all TS on all OutputPorts.
- The value 0xFFFF for PortNr and a valid Ref means search all OutputPorts to find the TSref to get the bitrate from.
- A valid PortNr and the value 0xFFFFFFFF for Ref means get the bitrate information of all TSs on the specified OutputPort.
- In case the board and port are valid and the Ref is invalid (and != 0xFFFFFFFF) an empty list will be returned.

8.18.3.7 TS_CompBitRateMeasurementList_t DCM::DeviceControl::MM_GetOutputTS_Component-BitRate (in IPS_RefTS_t *RefTS*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the component bitrate information of outgoing TS's.

Parameters

in	<i>RefTS</i>	Specifies BoardNr, PortNr & Ref to get the bitrates of.
----	--------------	---

Returns

TS_CompBitRateMeasurementList_t A list of [TS_CompBitRateMeasurement_t](#) holding the requested bitrate information.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main Board.
<i>OpNotSucceeded</i>	In case invalid PhysRef (board or port) are used.

Note

- The value 0xFFFF for PortNr and the value 0xFFFFFFFF for Ref means get the bitrate information of all TScomponents of all TSs on all OutputPorts.
- The value 0xFFFF for PortNr and a valid Ref means search all OutputPorts to find the TSref to get the TScomponent bitrates from.

- A valid PortNr and the value 0xFFFFFFFF for Ref means get the bitrate information of all the TSComponents of all the TSs on the specified OutputPort.
- In case the board and port are valid and the Ref is invalid (and != 0xFFFFFFFF) an empty list will be returned.

8.18.3.8 ServiceBitRateMeasurementList_t DCM::DeviceControl::MM_GetOutputTS_ServiceBitRate (in IPS_RefTS_t RefTS) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the service bitrate information of outgoing services.

Parameters

in	RefTS	Specifies BoardNr, PortNr & Ref to get the bitrates of.
----	-------	---

Returns

ServiceBitRateMeasurementList_t A list of [ServiceBitRateMeasurement_t](#) holding the requested bitrate information.

Exceptions

OpNotSupported	When BoardNr = 0 = Main Board.
OpNotSucceeded	In case invalid PhysRef (board or port) are used.

Note

- The value 0xFFFF for PortNr and the value 0xFFFFFFFF for Ref means get the bitrate information of all services of all TSs on all OutputPorts.
- The value 0xFFFF for PortNr and a valid Ref means search all OutputPorts to find the TSref to get the service bitrates from.
- A valid PortNr and the value 0xFFFFFFFF for Ref means get the bitrate information of all the services of all the TSs on the specified OutputPort.
- In case the board and port are valid and the Ref is invalid (and != 0xFFFFFFFF) an empty list will be returned.

8.18.3.9 void DCM::DeviceControl::MM_GetTR_GroupBitRate (in IPS_Ref_t PhysRef, in unsigned long GroupID, out ServiceBitRateSampleList_t InputServiceBitRate, out ServiceBitRateSampleList_t OutputServiceBitRate, out TRBitRateSample_t OutputGroupBitRate) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the bitrate information of transrated services.

Parameters

in	PhysRef	Specifies BoardNr, PortNr to get the bitrates of.
in	GroupID	Specifies which the group the PIDs belong to.
in	InputServiceBitRate	
in	OutputServiceBitRate	
in	OutputGroupBitRate	

Returns

InputServiceBitRate Requested input (before transrating) Service bitrate information.
 OutputServiceBitRate Requested output (after transrating) Service bitrate information.
 OutputGroupBitRate Requested output (after transrating) Transrater group bitrate information.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main Board.
<i>OpNotSucceeded</i>	In case invalid PhysRef (BoardNr PortNr) is used.

Note

- In case the GroupID is Invalid empty lists are returned.

8.18.3.10 void DCM::DeviceControl::MM_ResetTS_BitRate (in IPS_RefTS_t *RefTS*, in boolean *bInput*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Reset bitrate counters.

Parameters

in	<i>RefTS</i>	Specifies BoardNr, PortNr & Ref to reset the bitrates of.
in	<i>bInput</i>	Specifies the input(true) or output(false) TS.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main Board.
<i>OpNotSucceeded</i>	In case invalid PhysRef (board or port) are used.

Note

- There are two types of bitrate reset: 1. Reset the current values per (In or Output)TS (TS, - Services and Pids) and not the history. How to activate: BoardNr = valid, PortNr = valid, Ref = valid, bInput = valid.
- 2. Reset the complete bitratemodule of the board (Input and Output) including history. How to activate: BoardNr = valid, PortNr = 0xFFFF or = valid and the RefTS.Ref = 0xFFFFFFFF. bInput has no influence.

8.19 Clip Library

This contains specific types, enums and methods for the clip library (used by slate and logo insertion)

Classes

- struct [DCM::DeviceControl::SlateData_t](#)

Typedefs

- typedef unsigned long [DCM::DeviceControl::ClipID_t](#)
- typedef sequence< ClipID_t > [DCM::DeviceControl::ClipID_List_t](#)
- typedef sequence< SlateData_t > [DCM::DeviceControl::SlateDataList_t](#)

Functions

- void [DCM::DeviceControl::SlateLibrary_Add](#) (in unsigned short BoardNr, in string Description, in ByteStream Clip) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Add a slate clip to the clip library.
- void [DCM::DeviceControl::SlateLibrary_SetDataL](#) (in unsigned short BoardNr, in SlateDataList_t SlateDataL) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Set the data for a slate clip in the clip library.
- void [DCM::DeviceControl::SlateLibrary_GetDataL](#) (in unsigned short BoardNr, out SlateDataList_t SlateDataList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get details about all slate clips in the library.
- void [DCM::DeviceControl::SlateLibrary_DeleteL](#) (in unsigned short BoardNr, in ClipID_List_t - SlateID_List) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Remove a slate clip from the clip library.

8.19.1 Detailed Description

This contains specific types, enums and methods for the clip library (used by slate and logo insertion)

8.19.2 Typedef Documentation

8.19.2.1 typedef sequence<ClipID_t> DCM::DeviceControl::ClipID_List_t

Definition at line 10076 of file DCM.idl.

8.19.2.2 typedef unsigned long DCM::DeviceControl::ClipID_t

Definition at line 10075 of file DCM.idl.

8.19.2.3 typedef sequence<SlateData_t> DCM::DeviceControl::SlateDataList_t

Definition at line 10087 of file DCM.idl.

8.19.3 Function Documentation

8.19.3.1 void DCM::DeviceControl::SlateLibrary_Add (in unsigned short *BoardNr*, in string *Description*, in ByteStream *Clip*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Add a slate clip to the clip library.

Parameters

in	<i>BoardNr</i>	The board on which to add the clip.
in	<i>Description</i>	A description of the clip.
in	<i>Clip</i>	The clip data.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main
<i>OpNotSucceeded</i>	in case : - the Clip is not a valid clip. - No more entries available (maximum 512 clips in the library)

Version

Release 7.5

8.19.3.2 void DCM::DeviceControl::SlateLibrary_DeleteL (in unsigned short *BoardNr*, in ClipID_List_t *SlateID_List*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Remove a slate clip from the clip library.

Parameters

in	<i>BoardNr</i>	The board on which to remove the clip.
in	<i>SlateID_List</i>	A list of ClipID_t's of the clips to be deleted.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main
<i>OpNotSucceeded</i>	If the ClipID doesn't exist or the clip is still in use.

Version

Release 7.5

8.19.3.3 void DCM::DeviceControl::SlateLibrary_GetDataL (in unsigned short *BoardNr*, out SlateDataList_t *SlateDataList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get details about all slate clips in the library.

Parameters

in	<i>BoardNr</i>	The board on which to get the clip details.
out	<i>SlateDataList</i>	The list with data of all slate clips.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main
<i>OpNotSucceeded</i>	If the ClipID doesn't exist

Version

Release 7.5

8.19.3.4 void DCM::DeviceControl::SlateLibrary_SetDataL (in unsigned short *BoardNr*,
in SlateDataList_t *SlateDataL*) raises (TimeOut, OpNotSucceeded, OpNotAllowed,
OpNotSupported)

Set the data for a slate clip in the clip library.

Parameters

in	<i>BoardNr</i>	The board on which to set the clip data
in	<i>SlateDataL</i>	A list of ClipData.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main
<i>OpNotSucceeded</i>	if ClipID in SlateData_t is not a valid clip id.

Note

Only the Description of the clip can be changed.

Version

Release 7.5

8.20 Transcoder

This contains specific types, enums and methods for controlling the transcoder part of the device.

Classes

- struct `DCM::DeviceControl::TC_CaptionInfo_t`
Configuration settings for a Closed Caption Service.
- struct `DCM::DeviceControl::TC_BoardCfg_t`
- struct `DCM::DeviceControl::TC_PossibleBoardCfg_t`
- struct `DCM::DeviceControl::TC_BoardCfg_V2_t`
Structure to set/get transcoder board configuration.
- struct `DCM::DeviceControl::TC_PossibleBoardCfg_V2_t`
Structure to get possible board configurations for a transcoder board.
- struct `DCM::DeviceControl::EsEntry_t`
- struct `DCM::DeviceControl::SelectionListEntry_t`
- struct `DCM::DeviceControl::TC_Question_t`
- struct `DCM::DeviceControl::TC_DependantQuestion_t`
- struct `DCM::DeviceControl::TC_ServiceTrackingID_t`
- struct `DCM::DeviceControl::TC_VideoEncodeSettings_t`
Video encode settings.
- struct `DCM::DeviceControl::TC_VideoDecode_t`
Video decode settings together with fields identifying the video component they're for.
- struct `DCM::DeviceControl::TC_VideoEncode_t`
Video encode settings together with field identifying the video component they're for.
- struct `DCM::DeviceControl::TC_VideoSettings_t`
Video transcode settings.
- struct `DCM::DeviceControl::TC_VideoResolution_t`
- struct `DCM::DeviceControl::TC_VideoStatus_t`
- struct `DCM::DeviceControl::TC_Video_t`
Video transcode settings together with fields identifying the video component they're for.
- struct `DCM::DeviceControl::TC_VideoInformation_t`
- struct `DCM::DeviceControl::TC_PipSettings_t`
- struct `DCM::DeviceControl::TC_Pip_t`
- struct `DCM::DeviceControl::TC_AudioSettings_t`
- struct `DCM::DeviceControl::TC_AudioStatus_t`
- struct `DCM::DeviceControl::TC_Audio_t`
- struct `DCM::DeviceControl::TC_AudioInformation_t`
- struct `DCM::DeviceControl::TC_ServiceCfg_t`
- struct `DCM::DeviceControl::TC_VideoDecodeCfg_t`
- struct `DCM::DeviceControl::TC_VideoEncodeCfg_t`
- struct `DCM::DeviceControl::TC_VideoCfg_t`
- struct `DCM::DeviceControl::TC_VideoServiceInformation_t`
- struct `DCM::DeviceControl::TC_PipCfg_t`
- struct `DCM::DeviceControl::TC_AudioCfg_t`
- struct `DCM::DeviceControl::TC_AudioServiceInformation_t`
- struct `DCM::DeviceControl::TC_Component_t`
- struct `DCM::DeviceControl::TC_ServiceComponents_t`
- struct `DCM::DeviceControl::TC_ES_CaptionInfo_t`

Configuration settings for the Caption Service Descriptor of an ES.

- struct [DCM::DeviceControl::TC_Svc_CaptionInfo_t](#)

Configuration settings for the Caption Service Descriptor(s) of a service.

Typedefs

- typedef sequence < TC_CaptionInfo_t > [DCM::DeviceControl::TC_CaptionInfoList_t](#)
- typedef sequence < TC_PossibleBoardCfg_t > [DCM::DeviceControl::TC_PossibleBoardCfgList_t](#)
- typedef sequence < TC_PossibleBoardCfg_V2_t > [DCM::DeviceControl::TC_PossibleBoardCfgList_V2_t](#)
- typedef sequence< EsEntry_t > [DCM::DeviceControl::EsList_t](#)
- typedef unsigned long [DCM::DeviceControl::SelectionId_t](#)
- typedef sequence< SelectionId_t > [DCM::DeviceControl::SelectionIdList_t](#)
- typedef sequence < SelectionListEntry_t > [DCM::DeviceControl::SelectionList_t](#)
- typedef sequence< TC_Question_t > [DCM::DeviceControl::TC_QuestionList_t](#)
- typedef sequence < TC_DependantQuestion_t > [DCM::DeviceControl::TC_DependantQuestionList_t](#)
- typedef unsigned long [DCM::DeviceControl::TrackingID_t](#)
- typedef sequence< TrackingID_t > [DCM::DeviceControl::TrackingID_List_t](#)
- typedef sequence < TC_ServiceTrackingID_t > [DCM::DeviceControl::TC_ServiceTrackingID_List_t](#)
- typedef sequence < TC_VideoDecode_t > [DCM::DeviceControl::TC_VideoDecodeList_t](#)
- typedef sequence < TC_VideoEncode_t > [DCM::DeviceControl::TC_VideoEncodeList_t](#)
- typedef sequence< TC_Video_t > [DCM::DeviceControl::TC_VideoList_t](#)
- typedef sequence < TC_VideoInformation_t > [DCM::DeviceControl::TC_VideoInformationList_t](#)
- typedef sequence< TC_Pip_t > [DCM::DeviceControl::TC_PipList_t](#)
- typedef sequence< TC_Audio_t > [DCM::DeviceControl::TC_AudioList_t](#)
- typedef sequence < TC_AudioInformation_t > [DCM::DeviceControl::TC_AudioInformationList_t](#)
- typedef sequence< TC_ServiceCfg_t > [DCM::DeviceControl::TC_ServiceCfgList_t](#)
- typedef sequence < TC_VideoDecodeCfg_t > [DCM::DeviceControl::TC_VideoDecodeCfgList_t](#)
- typedef sequence < TC_VideoEncodeCfg_t > [DCM::DeviceControl::TC_VideoEncodeCfgList_t](#)
- typedef sequence< TC_VideoCfg_t > [DCM::DeviceControl::TC_VideoCfgList_t](#)
- typedef sequence < TC_VideoServiceInformation_t > [DCM::DeviceControl::TC_VideoServiceInformationList_t](#)
- typedef sequence< TC_PipCfg_t > [DCM::DeviceControl::TC_PipCfgList_t](#)
- typedef sequence< TC_AudioCfg_t > [DCM::DeviceControl::TC_AudioCfgList_t](#)
- typedef sequence < TC_AudioServiceInformation_t > [DCM::DeviceControl::TC_AudioServiceInformationList_t](#)
- typedef sequence< TC_Component_t > [DCM::DeviceControl::TC_ComponentList_t](#)
- typedef sequence < TC_ServiceComponents_t > [DCM::DeviceControl::TC_ServiceComponentsList_t](#)
- typedef sequence < TC_ES_CaptionInfo_t > [DCM::DeviceControl::TC_ES_CaptionInfoList_t](#)
- typedef sequence < TC_Svc_CaptionInfo_t > [DCM::DeviceControl::TC_Svc_CaptionInfoList_t](#)

Enumerations

- enum `DCM::DeviceControl::enTC_CaptionDescriptorMode_t` { `DCM::DeviceControl::eTC_CaptionDescriptorMode_AutoMode`, `DCM::DeviceControl::eTC_CaptionDescriptorMode_AddMode`, `DCM::DeviceControl::eTC_CaptionDescriptorMode_NoneMode`, `DCM::DeviceControl::eTC_CaptionDescriptorMode_Reserved1`, `DCM::DeviceControl::eTC_CaptionDescriptorMode_Reserved2`, `DCM::DeviceControl::eTC_CaptionDescriptorMode_Reserved3` }
- Defines different modes for the Caption Service Descriptor.*
- enum `DCM::DeviceControl::enTC_Profile_t` { `DCM::DeviceControl::eTC_Profile_Main`, `DCM::DeviceControl::eTC_Profile_High` }
- enum `DCM::DeviceControl::enTC_VBR_Quality_t` { `DCM::DeviceControl::eTC_VBR_Best`, `DCM::DeviceControl::eTC_VBR_Low_Valleys`, `DCM::DeviceControl::eTC_VBR_Moderate_Valleys`, `DCM::DeviceControl::eTC_VBR_Aggressive_Valleys`, `DCM::DeviceControl::eTC_VBR_Very_Aggressive_Valleys` }

- enum `DCM::DeviceControl::enTC_MaximumBitrateDescriptorMode_t` { `DCM::DeviceControl::eTC_MaximumBitrateDescriptorMode_Passthrough`, `DCM::DeviceControl::eTC_MaximumBitrateDescriptorMode_Generate` }

Functions

- void [DCM::DeviceControl::TC_GetBoardCfg](#) (in unsigned short BoardNr, out TC_BoardCfg_t - BoardCfg) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the current configuration of the transcoder.

- void [DCM::DeviceControl::TC_GetBoardCfg_V2](#) (in unsigned short BoardNr, out TC_BoardCfg_V2_t BoardCfg) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the current configuration of the transcoder.

- void [DCM::DeviceControl::TC_GetPossibleBoardCfgL](#) (in unsigned short BoardNr, out TC_PossibleBoardCfgList_t BoardCfgList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get a list of all board configurations whether they can be applied or not.

- void [DCM::DeviceControl::TC_GetPossibleBoardCfgL_V2](#) (in unsigned short BoardNr, out TC_PossibleBoardCfgList_V2_t BoardCfgList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get a list of all board configurations whether they can be applied or not.

- void [DCM::DeviceControl::TC_SetBoardCfg](#) (in unsigned short SlotNbr, in TC_BoardCfg_t BoardCfg) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Apply a new Board Configuration on a Transcoder board.

- void [DCM::DeviceControl::TC_SetBoardCfg_V2](#) (in unsigned short SlotNbr, in TC_BoardCfg_V2_t BoardCfg) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Apply a new Board Configuration on a Transcoder board.

- void [DCM::DeviceControl::TC_ServiceComponentsGetL](#) (in unsigned short BoardNr, in IPS_ServiceList_t ServiceList, out TC_ServiceComponentsList_t ServiceComponentsList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the list of components which can be transcoded.

- void [DCM::DeviceControl::TC_ServiceCfgGetL](#) (in unsigned short BoardNr, in IPS_ServiceList_t ServiceList, out TC_ServiceCfgList_t ServiceCfgList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the transcoder service settings.

- void [DCM::DeviceControl::TC_ServiceCfgSetL](#) (in unsigned short BoardNr, in TC_ServiceCfgList_t ServiceCfgList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Update the transcoder service settings.

- void [DCM::DeviceControl::TC_VideoCfgGetL](#) (in unsigned short BoardNr, in IPS_ServiceList_t ServiceList, out TC_VideoCfgList_t VideoCfgList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the video transcoding settings.

- void [DCM::DeviceControl::TC_VideoCfgSetL](#) (in unsigned short BoardNr, in TC_VideoCfgList_t VideoCfgList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

Set the video transcoding settings.

- void [DCM::DeviceControl::TC_VideoCfgDeleteL](#) (in unsigned short BoardNr, in TC_ServiceTrackingID_List_t ToDelete) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Remove video transcoding settings.

- void [DCM::DeviceControl::TC_PipCfgGetL](#) (in unsigned short BoardNr, in IPS_ServiceList_t ServiceList, out TC_PipCfgList_t PipCfgList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the PIP transcoding settings.

- void [DCM::DeviceControl::TC_PipCfgSetL](#) (in unsigned short BoardNr, in TC_PipCfgList_t PipCfgList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

Set the PIP transcoding settings.

- void **DCM::DeviceControl::TC_PipCfgDeleteL** (in unsigned short BoardNr, in TC_ServiceTrackingID_List_t ToDelete) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Remove PIP transcoding settings.

- void **DCM::DeviceControl::TC_VideoInformationGetL** (in unsigned short BoardNr, in IPS_Service_List_t ServiceList, out TC_VideoServiceInformationList_t VideoInfoList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get video status information.

- void **DCM::DeviceControl::TC_AudioCfgGetL** (in unsigned short BoardNr, in IPS_Service_List_t ServiceList, out TC_AudioCfgList_t AudioCfgList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the audio transcoding settings.

- void **DCM::DeviceControl::TC_AudioCfgSetL** (in unsigned short BoardNr, in TC_AudioCfgList_t AudioCfgList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

Set the audio transcoding settings.

- void **DCM::DeviceControl::TC_AudioCfgDeleteL** (in unsigned short BoardNr, in TC_ServiceTrackingID_List_t ToDelete) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Remove audio transcoding settings.

- void **DCM::DeviceControl::TC_AudioInformationGetL** (in unsigned short BoardNr, in IPS_Service_List_t ServiceList, out TC_AudioServiceInformationList_t AudioInfoList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get audio status information.

- ServiceBitRateMeasurementList_t **DCM::DeviceControl::MM_GetTC_ServiceBitRate** (in IPS_RefTS_t RefTS) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the service bitrate information of transcoded services.

- ServiceCompBitRateMeasurementList_t **DCM::DeviceControl::MM_GetTC_SvcComponentBitRate** (in IPS_RefTS_t RefTS, in ServiceIdList_t lstServices) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the component bitrate information of transcoded services.

- void **DCM::DeviceControl::TC_CaptionServiceCfgSetL** (in unsigned short BoardNr, in TC_Svc_CaptionInfoList_t Svc_CaptionInfoList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the transcoder caption service settings.

- void **DCM::DeviceControl::TC_CaptionServiceCfgGetL** (in unsigned short BoardNr, in IPS_Service_List_t ServiceList, out TC_Svc_CaptionInfoList_t Svc_CaptionInfoList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the transcoder caption service settings.

- void **DCM::DeviceControl::TC_VideoDecodeCfgSetL** (in unsigned short BoardNr, in TC_VideoDecodeCfgList_t VideoDecodeCfgList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

Set the video decoding settings.

- void **DCM::DeviceControl::TC_VideoDecodeCfgGetL** (in unsigned short BoardNr, in IPS_Service_List_t ServiceList, out TC_VideoDecodeCfgList_t VideoDecodeCfgList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the video decoding settings.

- void **DCM::DeviceControl::TC_VideoDecodeCfgDeleteL** (in unsigned short BoardNr, in TC_ServiceTrackingID_List_t ToDelete) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Remove the video decoding settings.

- void **DCM::DeviceControl::TC_VideoEncodeCfgSetL** (in unsigned short BoardNr, in TC_VideoEncodeCfgList_t VideoEncodeCfgList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)
Set the video encoding settings.
- void **DCM::DeviceControl::TC_VideoEncodeCfgGetL** (in unsigned short BoardNr, in IPS_ServiceList_t ServiceList, out TC_VideoEncodeCfgList_t VideoEncodeCfgList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
Get the video encoding settings.
- void **DCM::DeviceControl::TC_VideoEncodeCfgDeleteL** (in unsigned short BoardNr, in TC_ServiceTrackingID_List_t ToDelete) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Remove the video encoding settings.

8.20.1 Detailed Description

This contains specific types, enums and methods for controlling the transcoder part of the device.

8.20.2 Typedef Documentation

8.20.2.1 typedef sequence<EsEntry_t> DCM::DeviceControl::EsList_t

Definition at line 12873 of file DCM.idl.

8.20.2.2 typedef unsigned long DCM::DeviceControl::SelectionId_t

Definition at line 12875 of file DCM.idl.

8.20.2.3 typedef sequence<SelectionId_t> DCM::DeviceControl::SelectionIdList_t

Definition at line 12876 of file DCM.idl.

8.20.2.4 typedef sequence<SelectionListEntry_t> DCM::DeviceControl::SelectionList_t

Definition at line 12884 of file DCM.idl.

8.20.2.5 typedef sequence<TC_AudioCfg_t> DCM::DeviceControl::TC_AudioCfgList_t

Definition at line 13221 of file DCM.idl.

8.20.2.6 typedef sequence<TC_AudioInformation_t> DCM::DeviceControl::TC_AudioInformationList_t

Definition at line 13162 of file DCM.idl.

8.20.2.7 typedef sequence<TC_Audio_t> DCM::DeviceControl::TC_AudioList_t

Definition at line 13155 of file DCM.idl.

8.20.2.8 typedef sequence<TC_AudioServiceInformation_t> DCM::DeviceControl::TC_AudioServiceInformationList_t

Definition at line 13228 of file DCM.idl.

8.20.2.9 `typedef sequence<TC_CaptionInfo_t> DCM::DeviceControl::TC_CaptionInfoList_t`

Definition at line 10180 of file DCM.idl.

8.20.2.10 `typedef sequence<TC_Component_t> DCM::DeviceControl::TC_ComponentList_t`

Definition at line 13235 of file DCM.idl.

8.20.2.11 `typedef sequence<TC_DependantQuestion_t> DCM::DeviceControl::TC_Dependant-
QuestionList_t`

Definition at line 12898 of file DCM.idl.

8.20.2.12 `typedef sequence<TC_ES_CaptionInfo_t> DCM::DeviceControl::TC_ES_CaptionInfoList_t`

Definition at line 13254 of file DCM.idl.

8.20.2.13 `typedef sequence<TC_PipCfg_t> DCM::DeviceControl::TC_PipCfgList_t`

Definition at line 13214 of file DCM.idl.

8.20.2.14 `typedef sequence<TC_Pip_t> DCM::DeviceControl::TC_PipList_t`

Definition at line 13127 of file DCM.idl.

8.20.2.15 `typedef sequence<TC_PossibleBoardCfg_t> DCM::DeviceControl::TC_PossibleBoardCfg-
List_t`

Definition at line 12843 of file DCM.idl.

8.20.2.16 `typedef sequence<TC_PossibleBoardCfg_V2_t> DCM::DeviceControl::TC_PossibleBoard-
CfgList_V2_t`

Definition at line 12865 of file DCM.idl.

8.20.2.17 `typedef sequence<TC_Question_t> DCM::DeviceControl::TC_QuestionList_t`

Definition at line 12891 of file DCM.idl.

8.20.2.18 `typedef sequence<TC_ServiceCfg_t> DCM::DeviceControl::TC_ServiceCfgList_t`

Definition at line 13179 of file DCM.idl.

8.20.2.19 `typedef sequence<TC_ServiceComponents_t> DCM::DeviceControl::TC_Service-
ComponentsList_t`

Definition at line 13243 of file DCM.idl.

8.20.2.20 `typedef sequence<TC_ServiceTrackingID_t> DCM::DeviceControl::TC_ServiceTrackingID-
_List_t`

Definition at line 13005 of file DCM.idl.

8.20.2.21 `typedef sequence<TC_Svc_CaptionInfo_t> DCM::DeviceControl::TC_Svc_CaptionInfo-
List_t`

Definition at line 13263 of file DCM.idl.

8.20.2.22 `typedef sequence<TC_VideoCfg_t> DCM::DeviceControl::TC_VideoCfgList_t`

Definition at line 13200 of file DCM.idl.

8.20.2.23 `typedef sequence<TC_VideoDecodeCfg_t> DCM::DeviceControl::TC_VideoDecodeCfgList_t`

Definition at line 13186 of file DCM.idl.

8.20.2.24 `typedef sequence<TC_VideoDecode_t> DCM::DeviceControl::TC_VideoDecodeList_t`

Definition at line 13039 of file DCM.idl.

8.20.2.25 `typedef sequence<TC_VideoEncodeCfg_t> DCM::DeviceControl::TC_VideoEncodeCfgList_t`

Definition at line 13193 of file DCM.idl.

8.20.2.26 `typedef sequence<TC_VideoEncode_t> DCM::DeviceControl::TC_VideoEncodeList_t`

Definition at line 13050 of file DCM.idl.

8.20.2.27 `typedef sequence<TC_VideoInformation_t> DCM::DeviceControl::TC_VideoInformationList_t`

Definition at line 13106 of file DCM.idl.

8.20.2.28 `typedef sequence<TC_Video_t> DCM::DeviceControl::TC_VideoList_t`

Definition at line 13099 of file DCM.idl.

8.20.2.29 `typedef sequence<TC_VideoServiceInformation_t> DCM::DeviceControl::TC_VideoServiceInformationList_t`

Definition at line 13207 of file DCM.idl.

8.20.2.30 `typedef sequence<TrackingID_t> DCM::DeviceControl::TrackingID_List_t`

Definition at line 12998 of file DCM.idl.

8.20.2.31 `typedef unsigned long DCM::DeviceControl::TrackingID_t`

Definition at line 12997 of file DCM.idl.

8.20.3 Enumeration Type Documentation

8.20.3.1 `enum DCM::DeviceControl::enTC_AudioMode_t`

Enumerator:

eTC_AudioMode_Mono 1/0

eTC_AudioMode_Stereo 2/0

eTC_AudioMode_DualMono 1+1

eTC_AudioMode_Left_Right_Center 3/0

eTC_AudioMode_Left_Right_Surround 2/1

eTC_AudioMode_Left_Right_Center_Surround 3/1
eTC_AudioMode_Left_Right_SurroundLeft_SurroundRight 2/2
eTC_AudioMode_Left_Right_Center_SurroundLeft_SurroundRight 3/2

Definition at line 12985 of file DCM.idl.

8.20.3.2 enum DCM::DeviceControl::enTC_AudioSampleRate_t

Enumerator:

eTC_AudioSampleRate_Auto Follow input sample rate.
eTC_AudioSampleRate_16KHz
eTC_AudioSampleRate_32KHz
eTC_AudioSampleRate_44_1KHz 44.1 KHz
eTC_AudioSampleRate_48KHz

Definition at line 12976 of file DCM.idl.

8.20.3.3 enum DCM::DeviceControl::enTC_CaptionDescriptorMode_t

Defines different modes for the Caption Service Descriptor.

Enumerator:

eTC_CaptionDescriptorMode_AutoMode The Caption Service Descriptor will be passed to the output if present at the input. (factory default)
eTC_CaptionDescriptorMode_AddMode The Caption Service Descriptor is generated based on the input of the user.
eTC_CaptionDescriptorMode_NoneMode The Caption Service Descriptor will not be present at the output, even if present at the input.
eTC_CaptionDescriptorMode_Reserved1 future use undefined
eTC_CaptionDescriptorMode_Reserved2 future use undefined
eTC_CaptionDescriptorMode_Reserved3 future use undefined

Definition at line 10159 of file DCM.idl.

8.20.3.4 enum DCM::DeviceControl::enTC_ClosedCaptionFormat_t

Enumerator:

eTC_ClosedCaptionFormat_None Input contains no closed captions.
eTC_ClosedCaptionFormat_SA_Type_4
eTC_ClosedCaptionFormat_SCTE20
eTC_ClosedCaptionFormat_EAI708

Definition at line 12930 of file DCM.idl.

8.20.3.5 enum DCM::DeviceControl::enTC_ClosedCaptionMode_t

Enumerator:

eTC_ClosedCaptionMode_Disabled No closed captions in output.
eTC_ClosedCaptionMode_Transcode Transcode to CEA 708.
eTC_ClosedCaptionMode_TestPattern_1 Test pattern for field 1.
eTC_ClosedCaptionMode_TestPattern_2 Test pattern for field 2.
eTC_ClosedCaptionMode_TestPattern_1_2 Not supported.

Definition at line 12921 of file DCM.idl.

8.20.3.6 enum DCM::DeviceControl::enTC_EncodingMode_t

Enumerator:

eTC_EncodingMode_VBR
eTC_EncodingMode_CBR

Definition at line 12915 of file DCM.idl.

8.20.3.7 enum DCM::DeviceControl::enTC_MaximumBitrateDescriptorMode_t

Enumerator:

eTC_MaximumBitrateDescriptorMode_Passthrough Use the input descriptor (default value)
eTC_MaximumBitrateDescriptorMode_Generate An ES level maximum bitrate descriptor will be generated that matches the bitrate after transcoding. Any service level descriptor is passed through.

Definition at line 13164 of file DCM.idl.

8.20.3.8 enum DCM::DeviceControl::enTC_PerceptualNoiseSubstitution_t

Enumerator:

eTC_PNS_Disabled
eTC_PNS_Enabled

Definition at line 12962 of file DCM.idl.

8.20.3.9 enum DCM::DeviceControl::enTC_PipResolution_t

Enumerator:

eTC_PipResolution_96_96 96 * 96
eTC_PipResolution_SQCIF 128 * 96
eTC_PipResolution_QCIF 176 * 144
eTC_PipResolution_192_192 192 * 192
eTC_PipResolution_Reserved_1 future use, undefined
eTC_PipResolution_Reserved_2 future use, undefined
eTC_PipResolution_Reserved_3 future use, undefined
eTC_PipResolution_Reserved_4 future use, undefined

Definition at line 12938 of file DCM.idl.

8.20.3.10 enum DCM::DeviceControl::enTC_Profile_t

Enumerator:

eTC_Profile_Main
eTC_Profile_High

Definition at line 12900 of file DCM.idl.

8.20.3.11 enum DCM::DeviceControl::enTC_SpectralBandReplication_t

Enumerator:

eTC_SBR_Disabled HE-AAC.
eTC_SBR_Enabled AAC-LC.

Definition at line 12956 of file DCM.idl.

8.20.3.12 enum DCM::DeviceControl::enTC_TemporalNoiseShaping_t

Enumerator:

eTC_TNS_Disabled
eTC_TNS_Enabled

Definition at line 12950 of file DCM.idl.

8.20.3.13 enum DCM::DeviceControl::enTC_TransportPacketizationMode_t

Enumerator:

eTC_TPM_ADTS
eTC_TPM_LOAS Supported from V07.05 onwards.
eTC_TPM_ADIF Debug only.
eTC_TPM_RAW Debug only.

Definition at line 12968 of file DCM.idl.

8.20.3.14 enum DCM::DeviceControl::enTC_VBR_Quality_t

Enumerator:

eTC_VBR_Best
eTC_VBR_Low_Valleys
eTC_VBR_Moderate_Valleys
eTC_VBR_Aggressive_Valleys
eTC_VBR_Very_Aggressive_Valleys

Definition at line 12906 of file DCM.idl.

8.20.4 Function Documentation**8.20.4.1 ServiceBitRateMeasurementList_t DCM::DeviceControl::MM_GetTC_ServiceBitRate (in IPS_RefTS_t RefTS) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)**

Get the service bitrate information of transcoded services.

Parameters

in	<i>RefTS</i>	Specifies BoardNr, PortNr & Ref to get the bitrates of.
----	--------------	---

Returns

ServiceBitRateMeasurementList_t A list of [ServiceBitRateMeasurement_t](#) holding the requested bitrate information.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main or the board is not a transcoder board.
<i>OpNotSucceeded</i>	In case invalid PhysRef (board or port) are used.

Note

- The value 0xFFFF for PortNr and the value 0xFFFFFFFF for Ref means get the bitrate information of all services on a transcoder board.
- The value 0xFFFF for PortNr and a valid Ref means get the bitrate information of a single service on a transcoder board.

Version

Release 7.5

8.20.4.2 ServiceCompBitRateMeasurementList_t DCM::DeviceControl::MM_GetTC_SvcComponent-BitRate (in IPS_RefTS_t *RefTS*, in ServiceIdList_t *lstServices*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the component bitrate information of transcoded services.

Parameters

in	<i>RefTS</i>	Specifies BoardNr, PortNr & Ref to get the bitrates of.
in	<i>lstServices</i>	A list of service ID's. An empty list means all services.

Returns

ServiceCompBitRateMeasurementList_t A list of [ServiceCompBitRateMeasurement_t](#) holding the requested bitrate information.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main or the board is not a transcoder board.
<i>OpNotSucceeded</i>	In case invalid PhysRef (board or port) are used.

Note

- The value 0xFFFF for PortNr and the value 0xFFFFFFFF for Ref means get the bitrate information of all services on a transcoder board.
- The value 0xFFFF for PortNr and a valid Ref means get the bitrate information of a single service on a transcoder board.

Version

Release 7.5

8.20.4.3 void DCM::DeviceControl::TC_AudioCfgDeleteL (in unsigned short *BoardNr*, in TC_ServiceTrackingID_List_t *ToDelete*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Remove audio transcoding settings.

Parameters

in	<i>BoardNr</i>	The transcoder board for which to configure transcoding.
in	<i>ToDelete</i>	A list of IDs for audio settings to delete

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main or the board is not a transcoder board.
<i>OpNotSucceeded</i>	In case: • invalid input references are used (RefSvc, TrackingID).

Version

Release 7.5

8.20.4.4 void DCM::DeviceControl::TC_AudioCfgGetL (in unsigned short *BoardNr*, in IPS_Service_List_t *ServiceList*, out TC_AudioCfgList_t *AudioCfgList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the audio transcoding settings.

Parameters

in	<i>BoardNr</i>	The transcoder board to retrieve the settings from.
in	<i>ServiceList</i>	The list of services of interest.
out	<i>AudioCfgList</i>	A list of audio transcoding settings.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main or the board is not a transcoder board.
<i>OpNotSucceeded</i>	In case: • invalid input references are used (Ref, RefPid).

Version

Release 7.5

8.20.4.5 void DCM::DeviceControl::TC_AudioCfgSetL (in unsigned short *BoardNr*, in TC_AudioCfgList_t *AudioCfgList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

Set the audio transcoding settings.

Parameters

in	<i>BoardNr</i>	The transcoder board for which to configure transcoding.
in	<i>AudioCfgList</i>	A list of audio transcoding settings.

Note

Only streamtype tracking is supported.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main or the board is not a transcoder board.
<i>OpNotSucceeded</i>	In case: • invalid input references are used (RefSvc). • invalid settings are passed: – bitrate too high/low – ... • There are no more transcoding resources available

Version

Release 7.5

8.20.4.6 void DCM::DeviceControl::TC_AudioInformationGetL (in unsigned short *BoardNr*, in IPS_Service_List_t *ServiceList*, out TC_AudioServiceInformationList_t *AudioInfoList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get audio status information.

Information is only available on audio streams which are currently being transcoded.

Parameters

in	<i>BoardNr</i>	The transcoder board for which to configure transcoding.
in	<i>ServiceList</i>	The list of services of interest.
out	<i>AudioInfoList</i>	The status of the audio streams.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main or the board is not a transcoder board.
<i>OpNotSucceeded</i>	In case: invalid input references are used (RefSvc, TrackingID).

Version

Release 7.5

8.20.4.7 void DCM::DeviceControl::TC_CaptionServiceCfgGetL (in unsigned short *BoardNr*, in IPS_Service_List_t *ServiceList*, out TC_Svc_CaptionInfoList_t *Svc_CaptionInfoList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the transcoder caption service settings.

Parameters

in	<i>BoardNr</i>	The transcoder board to retrieve the settings from.
in	<i>ServiceList</i>	The list of services of interest.
out	<i>Svc_Caption-InfoList</i>	A list of caption service settings.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main or the board is not a transcoder board.
<i>OpNotSucceeded</i>	In case: invalid input references are used.

Version

Release 7.5

8.20.4.8 void DCM::DeviceControl::TC_CaptionServiceCfgSetL (in unsigned short *BoardNr*, in TC_Svc_CaptionInfoList_t *Svc_CaptionInfoList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the transcoder caption service settings.

Parameters

in	<i>BoardNr</i>	The transcoder board on which to apply the settings.
in	<i>Svc_Caption-InfoList</i>	A list of caption service settings,

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main or the board is not a transcoder board.
<i>OpNotSucceeded</i>	In case: • invalid input references are used. • invalid settings were passed.

Version

Release 7.5

8.20.4.9 void DCM::DeviceControl::TC_GetBoardCfg (in unsigned short *BoardNr*, out TC_BoardCfg_t *BoardCfg*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the current configuration of the transcoder.

This configuration determines how many SD, HD or audio streams the transcoder board can handle.

Parameters

in	<i>BoardNr</i>	The transcoder board to retrieve the settings from.
out	<i>BoardCfg</i>	The transcoder board configuration.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main or the board is not a transcoder board.
<i>OpNotSucceeded</i>	in case: • the number of PIP slots in the current configuration is different from 0: PIP slots are not supported by this function. Use TC_GetBoardCfg_V2() instead.

Version

Release 7.5

8.20.4.10 void DCM::DeviceControl::TC_GetBoardCfg_V2 (in unsigned short *BoardNr*, out TC_BoardCfg_V2_t *BoardCfg*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the current configuration of the transcoder.

This configuration determines how many SD, HD, audio and PIP streams the transcoder board can handle.

Parameters

in	<i>BoardNr</i>	The transcoder board to retrieve the settings from.
out	<i>BoardCfg</i>	The transcoder board configuration.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main or the board is not a transcoder board.
-----------------------	---

Version

Release 8.1

8.20.4.11 void DCM::DeviceControl::TC_GetPossibleBoardCfgL (in unsigned short *BoardNr*,
out TC_PossibleBoardCfgList_t *BoardCfgList*) raises (TimeOut, OpNotSucceeded,
OpNotAllowed, OpNotSupported)

Get a list of all board configurations whether they can be applied or not.

A board configuration can be applied if it has at least as many slots as there are configured transcodes for each type.

Parameters

in	<i>BoardNr</i>	The transcoder board to retrieve the settings from.
out	<i>BoardCfgList</i>	A list of all board configurations.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main or the board is not a transcoder board.
-----------------------	---

Version

Release 7.5

8.20.4.12 void DCM::DeviceControl::TC_GetPossibleBoardCfgL_V2 (in unsigned short *BoardNr*,
out TC_PossibleBoardCfgList_V2_t *BoardCfgList*) raises (TimeOut, OpNotSucceeded,
OpNotAllowed, OpNotSupported)

Get a list of all board configurations whether they can be applied or not.

A board configuration can be applied if it has at least as many slots as there are configured transcodes for each type.

Parameters

in	<i>BoardNr</i>	The transcoder board to retrieve the settings from.
out	<i>BoardCfgList</i>	A list of all board configurations.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main or the board is not a transcoder board.
-----------------------	---

Version

Release 8.1

8.20.4.13 void DCM::DeviceControl::TC_PipCfgDeleteL (in unsigned short *BoardNr*, in
TC_ServiceTrackingID_List_t *ToDelete*) raises (TimeOut, OpNotSucceeded, OpNotAllowed,
OpNotSupported)

Remove PIP transcoding settings.

Parameters

in	<i>BoardNr</i>	The transcoder board for which to configure transcoding.
in	<i>ToDelete</i>	A list of IDs for PIP settings to delete

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main or the board is not a transcoder board.
<i>OpNotSucceeded</i>	In case: invalid input references are used (RefSvc, TrackingID).

Version

Release 8.1

8.20.4.14 void DCM::DeviceControl::TC_PipCfgGetL (in unsigned short *BoardNr*, in IPS_Service_List_t *ServiceList*, out TC_PipCfgList_t *PipCfgList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the PIP transcoding settings.

Parameters

in	<i>BoardNr</i>	The transcoder board to retrieve the settings from.
in	<i>ServiceList</i>	The list of services of interest.
out	<i>PipCfgList</i>	A list of PIP transcoding settings.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main or the board is not a transcoder board.
<i>OpNotSucceeded</i>	In case: invalid input references are used (Ref, RefPid).

Version

Release 8.1

8.20.4.15 void DCM::DeviceControl::TC_PipCfgSetL (in unsigned short *BoardNr*, in TC_PipCfgList_t *PipCfgList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

Set the PIP transcoding settings.

Parameters

in	<i>BoardNr</i>	The transcoder board for which to configure transcoding.
in	<i>PipCfgList</i>	A list of PIP transcoding settings.

Note

The TrackingID of the PIP must always correspond to one of the following tracking ID's:

- a tracking ID of a video decode configured with TC_VideoDecodeCfgSetL(..). Then it is possible to configure PIP without a video encode. This option is supported since release 8.2 and is the preferred way.
- a tracking ID of a video transcode configured with TC_VideoCfgSetL(..). Then it is not possible to configure PIP without a video transcode. This option should be avoided.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main or the board is not a transcoder board.
<i>OpNotSucceeded</i>	In case: • invalid input references are used (RefSvc). • invalid settings are passed: – bitrate too high/low – ... • There are no more transcoding resources available

Version

Release 8.1

8.20.4.16 void DCM::DeviceControl::TC_ServiceCfgGetL (in unsigned short *BoardNr*, in IPS_Service_List_t *ServiceList*, out TC_ServiceCfgList_t *ServiceCfgList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the transcoder service settings.

Parameters

in	<i>BoardNr</i>	The transcoder board to retrieve the settings from.
in	<i>ServiceList</i>	The list of services of interest.
out	<i>ServiceCfgList</i>	A list of transcoder service settings.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main or the board is not a transcoder board.
<i>OpNotSucceeded</i>	In case: • invalid input references are used.

Version

Release 7.5

8.20.4.17 void DCM::DeviceControl::TC_ServiceCfgSetL (in unsigned short *BoardNr*, in TC_ServiceCfgList_t *ServiceCfgList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Update the transcoder service settings.

Parameters

in	<i>BoardNr</i>	The transcoder board to retrieve the settings from.
in	<i>ServiceCfgList</i>	A list of transcoder service settings.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main or the board is not a transcoder board.
<i>OpNotSucceeded</i>	In case: - invalid input references are used. - invalid settings were passed.

Version

Release 7.5

8.20.4.18 void DCM::DeviceControl::TC_ServiceComponentsGetL (in unsigned short *BoardNr*, in IPS_Service_List_t *ServiceList*, out TC_ServiceComponentsList_t *ServiceComponentsList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the list of components which can be transcoded.

Parameters

in	<i>BoardNr</i>	The transcoder board to retrieve the settings from.
in	<i>ServiceList</i>	The list of services of interest.
out	<i>Service-Components-List</i>	The list of components per service

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main or the board is not a transcoder board.
<i>OpNotSucceeded</i>	In case: invalid input references are used (ServiceList).

Version

Release 7.5

8.20.4.19 void DCM::DeviceControl::TC_SetBoardCfg (in unsigned short *SlotNbr*, in TC_BoardCfg_t *BoardCfg*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Apply a new Board Configuration on a Transcoder board.

This can cause interruptions in some or all transcoded streams.

Parameters

in	<i>SlotNbr</i>	The slotnumber for the affected board
in	<i>BoardCfg</i>	The new board configuration that the user likes to apply

Exceptions

<i>OpNotSucceeded</i>	- Impossible board configuration - Impossible to set mode without deleting audio or video components first
-----------------------	---

Version

Release 7.5

8.20.4.20 void DCM::DeviceControl::TC_SetBoardCfg_V2 (in unsigned short *SlotNbr*, in TC_BoardCfg_V2_t *BoardCfg*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Apply a new Board Configuration on a Transcoder board.

This can cause interruptions in some or all transcoded streams.

Parameters

in	<i>SlotNbr</i>	The slotnumber for the affected board
in	<i>BoardCfg</i>	The new board configuration that the user likes to apply

Exceptions

<i>OpNotSucceeded</i>	- Impossible board configuration - Impossible to set mode without deleting audio or video components first
-----------------------	---

Version

Release 8.1

8.20.4.21 void DCM::DeviceControl::TC_VideoCfgDeleteL (in unsigned short *BoardNr*, in TC_ServiceTrackingID_List_t *ToDelete*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Remove video transcoding settings.

Parameters

in	<i>BoardNr</i>	The transcoder board for which to configure transcoding.
in	<i>ToDelete</i>	A list of IDs for video settings to delete

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main or the board is not a transcoder board.
<i>OpNotSucceeded</i>	In case: invalid input references are used (RefSvc, TrackingID).

Deprecated Use TC_VideoDecodeCfgDeleteL(..) and TC_VideoEncodeCfgDeleteL(..) instead.

Version

Release 7.5

8.20.4.22 void DCM::DeviceControl::TC_VideoCfgGetL (in unsigned short *BoardNr*, in IPS_Service_List_t *ServiceList*, out TC_VideoCfgList_t *VideoCfgList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the video transcoding settings.

Parameters

in	<i>BoardNr</i>	The transcoder board to retrieve the settings from.
in	<i>ServiceList</i>	The list of services of interest.
out	<i>VideoCfgList</i>	A list of video transcoding settings.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main or the board is not a transcoder board.
<i>OpNotSucceeded</i>	In case: invalid input references are used (Ref, RefPid).

Deprecated Use TC_VideoDecodeCfgGetL(..) and TC_VideoEncodeCfgGetL(..) instead.

Version

Release 7.5

8.20.4.23 void DCM::DeviceControl::TC_VideoCfgSetL (in unsigned short *BoardNr*, in TC_VideoCfgList_t *VideoCfgList*) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

Set the video transcoding settings.

Parameters

in	<i>BoardNr</i>	The transcoder board for which to configure transcoding.
in	<i>VideoCfgList</i>	A list of video transcoding settings.

Note

Only streamtype tracking is supported.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main or the board is not a transcoder board.
<i>OpNotSucceeded</i>	In case: • invalid input references are used (RefSvc). • invalid settings are passed: – bitrate too high/low – ... • There are no more transcoding resources available

Deprecated Use TC_VideoDecodeCfgSetL(..) and TC_VideoEncodeCfgSetL(..) instead.

Version

Release 7.5

8.20.4.24 void DCM::DeviceControl::TC_VideoDecodeCfgDeleteL (in unsigned short *BoardNr*, in TC_ServiceTrackingID_List_t *ToDelete*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Remove the video decoding settings.

Parameters

in	<i>BoardNr</i>	The transcoder board for which to configure decoding
in	<i>ToDelete</i>	A list of IDs for video decoding settings to delete

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main or the board is not a transcoder board.
<i>OpNotSucceeded</i>	In case: • invalid input references are used (RefSvc, TrackingID).

Version

Release 8.2

8.20.4.25 void DCM::DeviceControl::TC_VideoDecodeCfgGetL (in unsigned short *BoardNr*, in IPS_Service_List_t *ServiceList*, out TC_VideoDecodeCfgList_t *VideoDecodeCfgList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the video decoding settings.

Parameters

in	<i>BoardNr</i>	The transcoder board to retrieve the settings from
in	<i>ServiceList</i>	The list of services of interest.
out	<i>VideoDecode-CfgList</i>	The video decoding settings

Version

Release 8.2

8.20.4.26 void DCM::DeviceControl::TC_VideoDecodeCfgSetL (in unsigned short *BoardNr*, in TC_VideoDecodeCfgList_t *VideoDecodeCfgList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

Set the video decoding settings.

Parameters

in	<i>BoardNr</i>	The transcoder board for which to configure decoding
in	<i>VideoDecode-CfgList</i>	The video decoding settings

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main or the board is not a transcoder board.
<i>OpNotSucceeded</i>	in case: • invalid input references are used (RefSvc) • there are no more transcoding resources available

Version

Release 8.2

8.20.4.27 void DCM::DeviceControl::TC_VideoEncodeCfgDeleteL (in unsigned short *BoardNr*, in TC_ServiceTrackingID_List_t *ToDelete*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Remove the video encoding settings.

Parameters

in	<i>BoardNr</i>	The transcoder board for which to configure encoding
in	<i>ToDelete</i>	A list of IDs for video encoding settings to delete

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main or the board is not a transcoder board.
<i>OpNotSucceeded</i>	In case: • invalid input references are used (RefSvc, TrackingID).

Version

Release 8.2

8.20.4.28 void DCM::DeviceControl::TC_VideoEncodeCfgGetL (in unsigned short *BoardNr*, in IPS_Service_List_t *ServiceList*, out TC_VideoEncodeCfgList_t *VideoEncodeCfgList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the video encoding settings.

Parameters

in	<i>BoardNr</i>	The transcoder board to retrieve the settings from
in	<i>ServiceList</i>	The list of services of interest.
out	<i>VideoEncode- CfgList</i>	The video encoding settings

Version

Release 8.2

8.20.4.29 void DCM::DeviceControl::TC_VideoEncodeCfgSetL (in unsigned short *BoardNr*, in TC_VideoEncodeCfgList_t *VideoEncodeCfgList*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

Set the video encoding settings.

Parameters

in	<i>BoardNr</i>	The transcoder board for which to configure encoding
in	<i>VideoEncode- CfgList</i>	The video encoding settings

Note

The TrackingID must always correspond to a video decode tracking ID configured with VideoDecode-CfgSetL(..). *

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main or the board is not a transcoder board.
<i>OpNotSucceeded</i>	in case: - invalid input references are used (RefSvc) - no video decode was configured

Version

Release 8.2

8.20.4.30 void DCM::DeviceControl::TC_VideoInformationGetL (in unsigned short *BoardNr*, in IPS_Service_List_t *ServiceList*, out TC_VideoServiceInformationList_t *VideoInfoList*)
raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get video status information.

Information is only available for video streams which are currently being transcoded.

Parameters

in	<i>BoardNr</i>	The transcoder board for which to configure transcoding.
in	<i>ServiceList</i>	The list of services of interest.
out	<i>VideoInfoList</i>	The status of the video streams.

Exceptions

<i>OpNotSupported</i>	When BoardNr = 0 = Main or the board is not a transcoder board.
<i>OpNotSucceeded</i>	In case: • invalid input references are used (RefSvc, TrackingID).

Version

Release 7.5

8.21 Multi format processor (MFP)

This contains specific types, enums and methods for controlling the MFP part of the device.

Classes

- struct [DCM::DeviceControl::MFPB_BoardCfg_t](#)
Structure to set/get transcoder board configuration.
- struct [DCM::DeviceControl::ResourcesLoad_t](#)
Resource loads.
- struct [DCM::DeviceControl::RefProcessorEngineUnit_t](#)
Identify a processing engine unit of a processor board.
- struct [DCM::DeviceControl::MFPB_EngineUnitCfg_t](#)
- struct [DCM::DeviceControl::MFPB_ServiceCfg_t](#)
- struct [DCM::DeviceControl::MFPB_MPEG2FramePicturesCfg_t](#)
- struct [DCM::DeviceControl::MFPB_ServiceTrackingID_t](#)
- struct [DCM::DeviceControl::MFPB_Component_t](#)
- struct [DCM::DeviceControl::MFPB_ServiceComponents_t](#)
- struct [DCM::DeviceControl::MFPB_VideoResolution_t](#)
- struct [DCM::DeviceControl::MFPB_VideoStatus_t](#)
- struct [DCM::DeviceControl::MFPB_VideoInformation_t](#)
- struct [DCM::DeviceControl::MFPB_VideoServiceInformation_t](#)
- struct [DCM::DeviceControl::MFPB_VideoDecode_t](#)
Video decode settings together with fields identifying the video component they're for.
- struct [DCM::DeviceControl::MFPB_VideoDecodeCfg_t](#)
- struct [DCM::DeviceControl::MFPB_VideoEncoderTemplate_t](#)
- struct [DCM::DeviceControl::MFPB_VideoEncodeSettings_t](#)
Video encode settings.
- struct [DCM::DeviceControl::MFPB_VideoEncode_t](#)
Video encode settings together with field identifying the video component they're for.
- struct [DCM::DeviceControl::MFPB_VideoEncodeCfg_t](#)
- struct [DCM::DeviceControl::MFPB_MultiResABR_t](#)
Note: it is required that FragmentLength and SegmentLength are a multiple of one another.
- struct [DCM::DeviceControl::MFPB_VideoEncodeSettingsV2_t](#)
Video encode settings.
- struct [DCM::DeviceControl::MFPB_VideoEncodeV2_t](#)
Video encode settings together with field identifying the video component they're for.
- struct [DCM::DeviceControl::MFPB_VideoEncodeCfgV2_t](#)
- struct [DCM::DeviceControl::MFPB_MultiResVideoEncodeSettings_t](#)
MultiResolution Video encode settings.
- struct [DCM::DeviceControl::MFPB_MultiResVideoEncode_t](#)
MultiRes video encode settings together with field identifying the video component they're for.
- struct [DCM::DeviceControl::MFPB_MultiResVideoEncodeCfg_t](#)
- struct [DCM::DeviceControl::MFPB_AudioStatus_t](#)
- struct [DCM::DeviceControl::MFPB_AudioInformation_t](#)
- struct [DCM::DeviceControl::MFPB_AudioServiceInformation_t](#)
- struct [DCM::DeviceControl::MFPB_AudioDecode_t](#)
Audio decode settings together with fields identifying the Audio component they're for.

- struct [DCM::DeviceControl::MFPB_AudioDecodeCfg_t](#)
- struct [DCM::DeviceControl::MFPB_AudioEncodeSettings_t](#)
Audio encode settings.
- struct [DCM::DeviceControl::MFPB_AudioEncode_t](#)
Audio encode settings together with field identifying the Audio component they're for.
- struct [DCM::DeviceControl::MFPB_AudioEncodeCfg_t](#)
- struct [DCM::DeviceControl::MFPB_MPEGL2_AudioSettings_t](#)
MPEG1-L2 audio processing settings.
- struct [DCM::DeviceControl::MFPB_MPEGL2AudioCfg_t](#)
Configuration settings for the MPEG1-L2 audio settings of a service.
- struct [DCM::DeviceControl::MFPB_AAC_AudioSettings_t](#)
AAC audio processing settings.
- struct [DCM::DeviceControl::MFPB_AacAudioCfg_t](#)
Configuration settings for the AAC audio settings of a service.
- struct [DCM::DeviceControl::MFPB_Dolby_AudioSettings_t](#)
Dolby audio processing settings.
- struct [DCM::DeviceControl::MFPB_DolbyAudioCfg_t](#)
Configuration settings for the Dolby audio settings of a service.
- struct [DCM::DeviceControl::MFPB_Dolby_AudioSettings_V2_t](#)
Dolby audio processing settings.
- struct [DCM::DeviceControl::MFPB_DolbyAudioCfg_V2_t](#)
Configuration settings for the Dolby audio settings of a service.
- struct [DCM::DeviceControl::MFPB_AudioDecodeExtraMPEGL2Settings_t](#)
Extra MPEG1-L2 decoder settings per audio ES.
- struct [DCM::DeviceControl::MFPB_AudioDecodeExtraMPEGL2Cfg_t](#)
Configuration for extra MPEG1-L2 decoder settings per service.
- struct [DCM::DeviceControl::MFPB_AudioDecodeExtraAACSettings_t](#)
Extra AAC decoder settings per audio ES.
- struct [DCM::DeviceControl::MFPB_AudioDecodeExtraAACCfg_t](#)
Configuration for extra AAC decoder settings per service.
- struct [DCM::DeviceControl::MFPB_AudioDecodeExtraDolbySettings_t](#)
Extra Dolby decoder settings per audio ES.
- struct [DCM::DeviceControl::MFPB_AudioDecodeExtraDolbyCfg_t](#)
Configuration for extra Dolby decoder settings per service.
- struct [DCM::DeviceControl::MFPB_ES_CaptionInfo_t](#)
Configuration settings for the Caption Service Descriptor of an ES.
- struct [DCM::DeviceControl::MFPB_Svc_CaptionInfo_t](#)
Configuration settings for the Caption Service Descriptor(s) of a service.
- struct [DCM::DeviceControl::MFPB_DD_MetaStatus_t](#)
Dolby meta data status for a specific component.
- struct [DCM::DeviceControl::MFPB_DD_MetaDecStatus_t](#)
Dolby meta data status on the decoder side for a specific component.
- struct [DCM::DeviceControl::MFPB_ServiceDD_MetaDecStatus_t](#)
Dolby meta data status on the decoder side for a specific service.
- struct [DCM::DeviceControl::MFPB_MetaDataCfg_t](#)
audio meta data settings for a specific component.
- struct [DCM::DeviceControl::MFPB_ServiceMetaDataCfg_t](#)
audio meta data settings for a specific service.

Typedefs

- typedef sequence < ResourcesLoad_t > [DCM::DeviceControl::ResourcesLoad_List_t](#)
- typedef sequence < RefProcessorEngineUnit_t > [DCM::DeviceControl::RefProcessorEngineUnitList_t](#)

Description of engine unit types (underlying hardware) for Multi format processor (MFP) boards.

- typedef sequence < MFPB_EngineUnitCfg_t > [DCM::DeviceControl::MFPB_EngineUnitCfgList_t](#)

Description of the slot type a service belongs to.

- typedef sequence < MFPB_ServiceCfg_t > [DCM::DeviceControl::MFPB_ServiceCfgList_t](#)
- typedef sequence < MFPB_MPEG2FramePicturesCfg_t > [DCM::DeviceControl::MFPB_MPEG2FramePicturesCfgList_t](#)
- typedef unsigned long [DCM::DeviceControl::MFPB_TrackingID_t](#)
- typedef sequence < MFPB_TrackingID_t > [DCM::DeviceControl::MFPB_TrackingID_List_t](#)
- typedef sequence < MFPB_ServiceTrackingID_t > [DCM::DeviceControl::MFPB_ServiceTrackingID_List_t](#)
- typedef sequence < MFPB_Component_t > [DCM::DeviceControl::MFPB_ComponentList_t](#)
- typedef sequence < MFPB_ServiceComponents_t > [DCM::DeviceControl::MFPB_ServiceComponentsList_t](#)
- typedef sequence < MFPB_VideoInformation_t > [DCM::DeviceControl::MFPB_VideoInformationList_t](#)
- typedef sequence < MFPB_VideoServiceInformation_t > [DCM::DeviceControl::MFPB_VideoServiceInformationList_t](#)
- typedef sequence < MFPB_VideoDecode_t > [DCM::DeviceControl::MFPB_VideoDecodeList_t](#)
- typedef sequence < MFPB_VideoDecodeCfg_t > [DCM::DeviceControl::MFPB_VideoDecodeCfgList_t](#)
- typedef sequence < MFPB_VideoEncode_t > [DCM::DeviceControl::MFPB_VideoEncodeList_t](#)
- typedef sequence < MFPB_VideoEncodeCfg_t > [DCM::DeviceControl::MFPB_VideoEncodeCfgList_t](#)
- typedef sequence < MFPB_MultiResABR_t > [DCM::DeviceControl::MFPB_MultiResABR_List_t](#)
- typedef sequence < MFPB_VideoEncodeV2_t > [DCM::DeviceControl::MFPB_VideoEncodeV2List_t](#)

## Functions

- void [DCM::DeviceControl::MFP\\_RequestReset](#) (in unsigned short BoardNr) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Request to restart the DCM\_MFP application and restore the current state.*
- void [DCM::DeviceControl::MFPB\\_GetBoardCfg](#) (in unsigned short SlotNbr, out MFPB\_BoardCfg\_t MFPB\_BoardCfg) raises (Timeout, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)  
*Get Board Configuration of a Multi format processor (MFP) board.*
- void [DCM::DeviceControl::MFPB\\_SetBoardCfg](#) (in unsigned short SlotNbr, in MFPB\_BoardCfg\_t MFPB\_BoardCfg) raises (Timeout, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)  
*Apply a new Board Configuration on a Multi format processor (MFP) board.*
- void [DCM::DeviceControl::MFPB\\_GetMfpResourcesLoad](#) (in unsigned short BoardNr, out ResourcesLoad\_List\_t ResourcesLoad\_List) raises (Timeout, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)  
*Get measured load of MFP resources.*
- void [DCM::DeviceControl::MFPB\\_GetEngineUnitCfg](#) (in unsigned short BoardNr, in RefProcessorEngineUnitList\_t RefProcessorEngineUnitList, out MFPB\_EngineUnitCfgList\_t EngineUnitCfgList) raises (Timeout, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)  
*Get the current configuration of the Multi format processor (MFP) engine unit.*
- void [DCM::DeviceControl::MFPB\\_SetEngineUnitCfg](#) (in unsigned short BoardNr, in MFPB\_EngineUnitCfgList\_t EngineUnitCfgList) raises (Timeout, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)  
*Apply a new processor engine unit configuration on a Multi format processor (MFP) board.*
- void [DCM::DeviceControl::MFPB\\_GetMPEG2FramePicturesCfg](#) (in unsigned short BoardNr, out MFPB\_MPEG2FramePicturesCfgList\_t MPEG2FramePicturesCfgList) raises (Timeout, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)  
*Get the current configuration of MPEG-2 Frame Pictures engine unit.*
- void [DCM::DeviceControl::MFPB\\_SetMPEG2FramePicturesCfg](#) (in unsigned short BoardNr, in MFPB\_MPEG2FramePicturesCfgList\_t MPEG2FramePicturesCfgList) raises (Timeout, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)  
*Apply a new configuration of MPEG-2 Frame Pictures on a Multi format processor (MFP) engine unit.*
- void [DCM::DeviceControl::MFPB\\_ResetEngine](#) (in unsigned short SlotNr, in unsigned short EngineNr) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Request to reset a DCM\_MFP engine.*
- void [DCM::DeviceControl::MFPB\\_ServiceCfgGetL](#) (in unsigned short BoardNr, in IPS\_Service\_List\_t ServiceList, out MFPB\_ServiceCfgList\_t ServiceCfgList) raises (Timeout, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)  
*Get the Multi format processor (MFP) service settings.*
- void [DCM::DeviceControl::MFPB\\_ServiceCfgSetL](#) (in unsigned short BoardNr, in MFPB\_ServiceCfgList\_t ServiceCfgList) raises (Timeout, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)  
*Add or update the Multi format processor (MFP) service settings.*

- void [DCM::DeviceControl::MFPB\\_ServiceComponentsGetL](#) (in unsigned short BoardNr, in IPS\_Service\_List\_t ServiceList, out MFPB\_ServiceComponentsList\_t ServiceComponentsList) raises (Timeout, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)

*Get the list of components which can be processed.*

- void [DCM::DeviceControl::MFPB\\_VideoInformationGetL](#) (in unsigned short BoardNr, in IPS\_Service\_List\_t ServiceList, out MFPB\_VideoServiceInformationList\_t VideoInfoList) raises (Timeout, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)

*Get video status information.*

- void [DCM::DeviceControl::MFPB\\_VideoDecodeCfgSetL](#) (in unsigned short BoardNr, in MFPB\_VideoDecodeCfgList\_t VideoDecodeCfgList) raises (Timeout, OperationFailed, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

*Set the video decoding settings.*

- void [DCM::DeviceControl::MFPB\\_VideoDecodeCfgGetL](#) (in unsigned short BoardNr, in IPS\_Service\_List\_t ServiceList, out MFPB\_VideoDecodeCfgList\_t VideoDecodeCfgList) raises (Timeout, OperationFailed, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the video decoding settings.*

- void [DCM::DeviceControl::MFPB\\_VideoDecodeCfgDeleteL](#) (in unsigned short BoardNr, in MFPB\_ServiceTrackingID\_List\_t ToDelete) raises (Timeout, OperationFailed, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Remove the video decoding settings.*

- void [DCM::DeviceControl::MFPB\\_VideoEncodeCfgSetL](#) (in unsigned short BoardNr, in MFPB\_VideoEncodeCfgList\_t VideoEncodeCfgList) raises (Timeout, OperationFailed, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

*Set the video encoding settings.*

- void [DCM::DeviceControl::MFPB\\_VideoEncodeCfgGetL](#) (in unsigned short BoardNr, in IPS\_Service\_List\_t ServiceList, out MFPB\_VideoEncodeCfgList\_t VideoEncodeCfgList) raises (Timeout, OperationFailed, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the video encoding settings.*

- void [DCM::DeviceControl::MFPB\\_VideoEncodeCfgV2SetL](#) (in unsigned short BoardNr, in MFPB\_VideoEncodeCfgV2List\_t VideoEncodeCfgList) raises (Timeout, OperationFailed, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

*Set the video encoding settings.*

- void [DCM::DeviceControl::MFPB\\_VideoEncodeCfgV2GetL](#) (in unsigned short BoardNr, in IPS\_Service\_List\_t ServiceList, out MFPB\_VideoEncodeCfgV2List\_t VideoEncodeCfgList) raises (-Timeout, OperationFailed, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the video encoding settings.*

- void [DCM::DeviceControl::MFPB\\_VideoEncodeCfgDeleteL](#) (in unsigned short BoardNr, in MFPB\_ServiceTrackingID\_List\_t ToDelete) raises (Timeout, OperationFailed, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Remove the video encoding settings and related closed caption settings.*

- void [DCM::DeviceControl::MFPB\\_MultiResVideoEncodeCfgSetL](#) (in IPS\_RefSvc\_t MainService, in MFPB\_MultiResVideoEncodeCfgList\_t MultiResVideoEncodeCfgList) raises (Timeout, OperationFailed, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

*Create and or set the video encoding settings for one or more multi resolution services belonging to one particular main service.*

- void [DCM::DeviceControl::MFPB\\_MultiResVideoEncodeCfgGetL](#) (in IPS\_RefSvc\_t MainService, out MFPB\_MultiResVideoEncodeCfgList\_t MultiResVideoEncodeCfgList) raises (Timeout, OperationFailed, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the video encoding settings for the multi resolution services belonging to one particular main service.*

- void [DCM::DeviceControl::MFPB\\_MultiResVideoEncodeDeleteL](#) (in IPS\_RefSvc\_t MainService, in IPS\_RefSvc\_List\_t RefSvcList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Delete one or more multi resolution services on a MFP board from a particular main service.*

- void [DCM::DeviceControl::MFPB\\_SetMultiResABR](#) (in unsigned short SlotNbr, in MFPB\_MultiResABR\_List\_t MultiResABR\_List) raises (Timeout, OperationFailed, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Set the ABR settings for all multi resolution services belonging to one particular main service.*

- void [DCM::DeviceControl::MFPB\\_GetMultiResABR](#) (in unsigned short SlotNbr, in IPS\_RefSvc\_List\_t RefSvcList, out MFPB\_MultiResABR\_List\_t MultiResABR\_List) raises (Timeout, OperationFailed, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the ABR settings for all multi resolution services belonging to one particular main service.*

- void [DCM::DeviceControl::MFPB\\_AudioInformationGetL](#) (in unsigned short BoardNr, in IPS\_Service\_List\_t ServiceList, out MFPB\_AudioServiceInformationList\_t AudioInfoList) raises (Timeout, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)

*Get audio status information.*

- void [DCM::DeviceControl::MFPB\\_AudioDecodeCfgSetL](#) (in unsigned short BoardNr, in MFPB\_AudioDecodeCfgList\_t AudioDecodeCfgList) raises (Timeout, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported, LicenseError)

*Set the Audio decoding settings.*

- void [DCM::DeviceControl::MFPB\\_AudioDecodeCfgGetL](#) (in unsigned short BoardNr, in IPS\_Service\_List\_t ServiceList, out MFPB\_AudioDecodeCfgList\_t AudioDecodeCfgList) raises (Timeout, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)

*Get the Audio decoding settings.*

- void [DCM::DeviceControl::MFPB\\_AudioDecodeCfgDeleteL](#) (in unsigned short BoardNr, in MFPB\_ServiceTrackingID\_List\_t ToDelete) raises (Timeout, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)

*Remove the Audio decoding settings.*

- void [DCM::DeviceControl::MFPB\\_AudioEncodeCfgSetL](#) (in unsigned short BoardNr, in MFPB\_AudioEncodeCfgList\_t AudioEncodeCfgList) raises (Timeout, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported, LicenseError)

*Set the Audio encoding settings.*

- void [DCM::DeviceControl::MFPB\\_AudioEncodeCfgGetL](#) (in unsigned short BoardNr, in IPS\_Service\_List\_t ServiceList, out MFPB\_AudioEncodeCfgList\_t AudioEncodeCfgList) raises (Timeout, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)

*Get the Audio encoding settings.*

- void [DCM::DeviceControl::MFPB\\_AudioEncodeCfgDeleteL](#) (in unsigned short BoardNr, in MFPB\_ServiceTrackingID\_List\_t ToDelete) raises (Timeout, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)

*Remove the Audio encoding settings and all settings related to it (AAC/Dolby audio settings)*

- void [DCM::DeviceControl::MFPB\\_MPEGL2AudioCfgSetL](#) (in unsigned short BoardNr, in MFPB\_MPEGL2AudioCfgList\_t MPEGL2AudioCfgList) raises (Timeout, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported, LicenseError)

*Set the MPEG1-L2 audio processing settings.*

- void [DCM::DeviceControl::MFPB\\_MPEGL2AudioCfgGetL](#) (in unsigned short BoardNr, in IPS\_Service\_List\_t ServiceList, out MFPB\_MPEGL2AudioCfgList\_t MPEGL2AudioCfgList) raises (-Timeout, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)

*Get the MPEG1-L2 audio processing settings.*

- void [DCM::DeviceControl::MFPB\\_AACAudioCfgSetL](#) (in unsigned short BoardNr, in MFPB\_AACAudioCfgList\_t AACAudioCfgList) raises (Timeout, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported, LicenseError)

*Set the AAC audio processing settings.*

- void [DCM::DeviceControl::MFPB\\_AACAudioCfgGetL](#) (in unsigned short BoardNr, in IPS\_Service\_List\_t ServiceList, out MFPB\_AacAudioCfgList\_t AacAudioCfgList) raises (TimeOut, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)

*Get the AAC audio processing settings.*

- void [DCM::DeviceControl::MFPB\\_DolbyAudioCfgSetL](#) (in unsigned short BoardNr, in MFPB\_DolbyAudioCfgList\_t DolbyAudioCfgList) raises (TimeOut, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported, LicenseError)

*Set the dolby audio processing settings.*

- void [DCM::DeviceControl::MFPB\\_DolbyAudioCfgGetL](#) (in unsigned short BoardNr, in IPS\_Service\_List\_t ServiceList, out MFPB\_DolbyAudioCfgList\_t DolbyAudioCfgList) raises (TimeOut, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)

*Get the dolby audio processing settings.*

- void [DCM::DeviceControl::MFPB\\_DolbyAudioCfgSetL\\_V2](#) (in unsigned short BoardNr, in MFPB\_DolbyAudioCfgList\_V2\_t DolbyAudioCfgList) raises (TimeOut, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported, LicenseError)

*Set the dolby audio processing settings.*

- void [DCM::DeviceControl::MFPB\\_DolbyAudioCfgGetL\\_V2](#) (in unsigned short BoardNr, in IPS\_Service\_List\_t ServiceList, out MFPB\_DolbyAudioCfgList\_V2\_t DolbyAudioCfgList) raises (TimeOut, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)

*Get the dolby audio processing settings.*

- void [DCM::DeviceControl::MFPB\\_AudioDecodeExtraMPEGL2SetL](#) (in unsigned short BoardNr, in MFPB\_AudioDecodeExtraMPEGL2CfgList\_t AudioDecodeExtraMPEGL2CfgList) raises (TimeOut, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)

*Update extra MPEG1-L2 audio decoding options.*

- void [DCM::DeviceControl::MFPB\\_AudioDecodeExtraMPEGL2GetL](#) (in unsigned short BoardNr, in IPS\_Service\_List\_t ServiceList, out MFPB\_AudioDecodeExtraMPEGL2CfgList\_t AudioDecodeExtraMPEGL2CfgList) raises (TimeOut, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)

*Get extra MPEG1-L2 audio decoding options.*

- void [DCM::DeviceControl::MFPB\\_AudioDecodeExtraAACSetL](#) (in unsigned short BoardNr, in AudioDecodeExtraAACCfgList\_t AudioDecodeExtraAACCfgList) raises (TimeOut, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)

*Update extra AAC audio decoding settings.*

- void [DCM::DeviceControl::MFPB\\_AudioDecodeExtraAACGetL](#) (in unsigned short BoardNr, in IPS\_Service\_List\_t ServiceList, out AudioDecodeExtraAACCfgList\_t AudioDecodeExtraAACCfgList) raises (TimeOut, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)

*Get extra AAC audio decoding settings.*

- void [DCM::DeviceControl::MFPB\\_AudioDecodeExtraDolbySetL](#) (in unsigned short BoardNr, in MFPB\_AudioDecodeExtraDolbyCfgList\_t AudioDecodeExtraDolbyCfgList) raises (TimeOut, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)

*Update extra Dolby audio decoding settings.*

- void [DCM::DeviceControl::MFPB\\_AudioDecodeExtraDolbyGetL](#) (in unsigned short BoardNr, in IPS\_Service\_List\_t ServiceList, out MFPB\_AudioDecodeExtraDolbyCfgList\_t AudioDecodeExtraDolbyCfgList) raises (TimeOut, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)

*Get extra Dolby audio decoding settings.*

- void [DCM::DeviceControl::MFPB\\_CaptionServiceCfgSetL](#) (in unsigned short BoardNr, in MFPB\_Svc\_CaptionInfoList\_t Svc\_CaptionInfoList) raises (TimeOut, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)

*Set the MFP closed caption descriptor settings.*

- void [DCM::DeviceControl::MFPB\\_CaptionServiceCfgGetL](#) (in unsigned short BoardNr, in IPS\_Service\_List\_t ServiceList, out MFPB\_Svc\_CaptionInfoList\_t Svc\_CaptionInfoList) raises (Timeout, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)

*Get the MFP closed caption descriptor settings.*

- void [DCM::DeviceControl::MFPB\\_DD\\_MetaDecStatusGetL](#) (in unsigned short BoardNr, in IPS\_Service\_List\_t ServiceList, out MFPB\_ServiceDD\_MetaDecStatusList\_t StatusList) raises (Timeout, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)

*Get Dolby meta data status on the decoder.*

- void [DCM::DeviceControl::MFPB\\_MetaDataCfgSetL](#) (in unsigned short BoardNr, in MFPB\_Service\_MetaDataCfgList\_t MetaDataCfgList) raises (Timeout, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported, LicenseError)

*Set the audio meta data configuration.*

- void [DCM::DeviceControl::MFPB\\_MetaDataCfgGetL](#) (in unsigned short BoardNr, in IPS\_Service\_List\_t ServiceList, out MFPB\_ServiceMetaDataCfgList\_t MetaDataCfgList) raises (Timeout, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)

*Get the audio meta data configuration.*

### 8.21.1 Detailed Description

This contains specific types, enums and methods for controlling the MFP part of the device. A quick overview of how the MFP IDL interface is typically used -----

-----

- Configure the board to enable/disable audio processing: [MFPB\\_GetBoardCfg/MFPB\\_SetBoardCfg](#)
- Check the available engine units (can depend on the audio processing mode, chassis, board version, ... ): [MFPB\\_GetEngineUnitCfg](#)
- Configure the mode of the engine units e.g.: SD, HD, Mixed, Splice, ... : [MFPB\\_SetEngineUnitCfg](#) ...
- Pass a service to the board (MFP will handle this as a delayed service): [TC\\_ServiceAddL/Processor-ServiceAddL](#)
- Change MFP service settings e.g. the delay: [MFPB\\_ServiceCfgGetL/MFPB\\_ServiceCfgSetL](#)
- To prepare processing, move the newly passed service to a slot on a engine unit: [MFPB\\_ServiceCfgSetL/GetL](#)
- Check what components (PIDs) are processable, check if PIDs have matched with what settings: [MFPB\\_ServiceComponentsGetL](#)
- Add decoders (with tracking ID = 0): [MFPB\\_VideoDecodeCfgSetL](#), [MFPB\\_AudioDecodeCfgSetL](#)
- Get tracking IDs of the newly added decoders: [MFPB\\_VideoDecodeCfgGetL](#), [MFPB\\_AudioDecodeCfgGetL](#)
- Add encoders with tracking ID of the respective decoders : [MFPB\\_VideoEncodeCfgSetL](#), [MFPB\\_AudioEncodeCfgSetL](#) ...
- Check what decoder/encoder settings have matched with what PID: [MFPB\\_ServiceComponentsGetL](#)
- Check property bits if service/engine unit is processing: [TC\\_ServiceGetL](#), [MFPB\\_GetEngineUnitCfg](#)

- Check the decoder status: MFPB\_VideoInformationGetL, MFPB\_AudioInformationGetL ...
- Optionally do some advanced settings (respective encoder must exist): MFPB\_CaptionServiceCfgSetL/GetL, MFPB\_AACAudioCfgSetL/GetL, MFPB\_DolbyAudioCfgSetL/GetL
- Optionally update decoder/encoder settings: MFPB\_VideoDecodeCfgSetL, MFPB\_AudioDecodeCfgSetL, MFPB\_VideoEncodeCfgSetL, MFPB\_AudioEncodeCfgSetL
- Optionally move service between engine units or slots: MFPB\_ServiceCfgSetL/GetL ...
- Remove encoder. This will delete all but decoder settings (encoder, closed caption, AAC, Dolby, ... are deleted): MFPB\_VideoEncodeCfgDeleteL, MFPB\_AudioEncodeCfgDeleteL
- Remove decoder. This will also delete all settings related to this tracking ID (encoder, closed caption, AAC, Dolby, ...): MFPB\_VideoDecodeCfgDeleteL, MFPB\_AudioDecodeCfgDeleteL
- Remove service from MFP board (and all its settings eg, service, decoders, encoders, ... ): TC\_ServiceDeleteL

### 8.21.2 Typedef Documentation

**8.21.2.1** `typedef sequence<MFPB_AudioDecodeExtraAACCfg_t> DCM::DeviceControl::AudioDecode-ExtraAACCfgList_t`

Definition at line 12475 of file DCM.idl.

**8.21.2.2** `typedef sequence<MFPB_AAC_AudioSettings_t> DCM::DeviceControl::MFPB_AAC_Audio-SettingsList_t`

Definition at line 11979 of file DCM.idl.

**8.21.2.3** `typedef sequence<MFPB_AacAudioCfg_t> DCM::DeviceControl::MFPB_AacAudioCfgList_t`

Definition at line 11988 of file DCM.idl.

**8.21.2.4** `typedef sequence<MFPB_AudioDecodeCfg_t> DCM::DeviceControl::MFPB_AudioDecode-CfgList_t`

Definition at line 11672 of file DCM.idl.

**8.21.2.5** `typedef sequence<MFPB_AudioDecodeExtraAACSettings_t> DCM::DeviceControl::MFPB_-AudioDecodeExtraAACSettingsList_t`

Definition at line 12464 of file DCM.idl.

**8.21.2.6** `typedef sequence<MFPB_AudioDecodeExtraDolbyCfg_t> DCM::DeviceControl::MFPB_-AudioDecodeExtraDolbyCfgList_t`

Definition at line 12567 of file DCM.idl.

**8.21.2.7** `typedef sequence<MFPB_AudioDecodeExtraDolbySettings_t> DCM::DeviceControl::MFPB_-AudioDecodeExtraDolbySettingsList_t`

Definition at line 12556 of file DCM.idl.

**8.21.2.8** `typedef sequence<MFPB_AudioDecodeExtraMPEGL2Cfg_t> DCM::DeviceControl::MFPB_AudioDecodeExtraMPEGL2CfgList_t`

Definition at line 12407 of file DCM.idl.

**8.21.2.9** `typedef sequence<MFPB_AudioDecodeExtraMPEGL2Settings_t> DCM::DeviceControl::MFPB_AudioDecodeExtraMPEGL2SettingsList_t`

Definition at line 12396 of file DCM.idl.

**8.21.2.10** `typedef sequence<MFPB_AudioDecode_t> DCM::DeviceControl::MFPB_AudioDecodeList_t`

Definition at line 11665 of file DCM.idl.

**8.21.2.11** `typedef sequence<MFPB_AudioEncodeCfg_t> DCM::DeviceControl::MFPB_AudioEncodeCfgList_t`

Definition at line 11797 of file DCM.idl.

**8.21.2.12** `typedef sequence<MFPB_AudioEncode_t> DCM::DeviceControl::MFPB_AudioEncodeList_t`

Definition at line 11790 of file DCM.idl.

**8.21.2.13** `typedef sequence<MFPB_AudioInformation_t> DCM::DeviceControl::MFPB_AudioInformationList_t`

Definition at line 11624 of file DCM.idl.

**8.21.2.14** `typedef sequence<MFPB_AudioServiceInformation_t> DCM::DeviceControl::MFPB_AudioServiceInformationList_t`

Definition at line 11631 of file DCM.idl.

**8.21.2.15** `typedef sequence<MFPB_Component_t> DCM::DeviceControl::MFPB_ComponentList_t`

Definition at line 10562 of file DCM.idl.

**8.21.2.16** `typedef sequence<MFPB_DD_MetaDecStatus_t> DCM::DeviceControl::MFPB_DD_MetaDecStatusList_t`

Definition at line 12714 of file DCM.idl.

**8.21.2.17** `typedef sequence<MFPB_Dolby_AudioSettings_t> DCM::DeviceControl::MFPB_Dolby_AudioSettingsList_t`

Definition at line 12142 of file DCM.idl.

**8.21.2.18** `typedef sequence<MFPB_Dolby_AudioSettings_V2_t> DCM::DeviceControl::MFPB_Dolby_AudioSettingsList_V2_t`

Definition at line 12313 of file DCM.idl.

**8.21.2.19** `typedef sequence<MFPB_DolbyAudioCfg_t> DCM::DeviceControl::MFPB_DolbyAudioCfgList_t`

Definition at line 12151 of file DCM.idl.

**8.21.2.20** `typedef sequence<MFPB_DolbyAudioCfg_V2_t> DCM::DeviceControl::MFPB_DolbyAudioCfgList_V2_t`

Definition at line 12322 of file DCM.idl.

**8.21.2.21** `typedef sequence<MFPB_EngineUnitCfg_t> DCM::DeviceControl::MFPB_EngineUnitCfgList_t`

Description of the slot type a service belongs to.

Definition at line 10392 of file DCM.idl.

**8.21.2.22** `typedef sequence<MFPB_ES_CaptionInfo_t> DCM::DeviceControl::MFPB_ES_CaptionInfoList_t`

Definition at line 12620 of file DCM.idl.

**8.21.2.23** `typedef sequence<MFPB_MetaDataCfg_t> DCM::DeviceControl::MFPB_MetaDataCfgList_t`

Definition at line 12769 of file DCM.idl.

**8.21.2.24** `typedef sequence<MFPB_MPEG2FramePicturesCfg_t> DCM::DeviceControl::MFPB_MPEG2FramePicturesCfgList_t`

Definition at line 10474 of file DCM.idl.

**8.21.2.25** `typedef sequence<MFPB_MPEGL2_AudioSettings_t> DCM::DeviceControl::MFPB_MPEGL2_AudioSettingsList_t`

Definition at line 11867 of file DCM.idl.

**8.21.2.26** `typedef sequence<MFPB_MPEGL2AudioCfg_t> DCM::DeviceControl::MFPB_MPEGL2AudioCfgList_t`

### 8.21.3 Enumeration Type Documentation

**8.21.3.1** `enum DCM::DeviceControl::enMFPB_AAC_AdvancedEncodingTools`

Enumerator:

*eMFPB\_AET\_None* For AAC-LC.  
*eMFPB\_AET\_TNS* TNS.  
*eMFPB\_AET\_PNS\_TNS* PNS + TNS.  
*eMFPB\_AET\_SBR* For HE-AACv1: SBR.  
*eMFPB\_AET\_SBR\_PS* For HE-AACv2: SBR + PS.  
*eMFPB\_AET\_DRC* For Future functionality.  
*eMFPB\_AET\_Reserved7* For Future functionality.  
*eMFPB\_AET\_Reserved8* For Future functionality.  
*eMFPB\_AET\_Reserved9* For Future functionality.  
*eMFPB\_AET\_Reserved10* For Future functionality.

Definition at line 11933 of file DCM.idl.

**8.21.3.2** `enum DCM::DeviceControl::enMFPB_AAC_TransportPacketMode_t`

Enumerator:

*eMFPB\_PacketMode\_MPEG2\_ADTS* MPEG-2 ADTS.

*eMFPB\_PacketMode\_MPEG4\_ADTS* MPEG-4 ADTS (No CRC)  
*eMFPB\_PacketMode\_MPEG4\_LATM* MPEG-4 LATM/LOAS.  
*eMFPB\_PacketMode\_MPEG4\_LATM\_EXPL* MPEG-4 LATM/LOAS explicit, AAC HE only.  
*eMFPB\_PacketMode\_MPEG4\_ADTS\_CRC* For Future functionality, MPEG-4 ADTS + CRC.  
*eMFPB\_PacketMode\_Reserved5* For Future functionality.  
*eMFPB\_PacketMode\_Reserved6* For Future functionality.  
*eMFPB\_PacketMode\_Reserved7* For Future functionality.  
*eMFPB\_PacketMode\_Reserved8* For Future functionality.

Definition at line 11920 of file DCM.idl.

### 8.21.3.3 enum DCM::DeviceControl::enMFPB\_AdaptSI\_t

Enumerator:

*eMFPB\_AdaptSI\_Disabled* No SI adaptation.  
*eMFPB\_AdaptSI\_DVB* Adapt SI, prefer DVB ES type (AC-3 audio uses ES type 0x06 + AC-3 descriptor, MPEG-2 video uses ES type 0x02)  
*eMFPB\_AdaptSI\_ATSC* Adapt SI, prefer ATSC ES type (AC-3 audio uses ES type 0x81, MPEG-2 video uses ES type 0x02)  
*eMFPB\_AdaptSI\_DC2* Adapt SI, prefer DC-II ES type (AC-3 audio uses ES type 0x81, MPEG-2 video uses ES type 0x80)

Definition at line 10405 of file DCM.idl.

### 8.21.3.4 enum DCM::DeviceControl::enMFPB\_Afd

Enumerator:

*enMFPB\_Afd\_16\_9\_b\_top* Box 16:9 (top)  
*enMFPB\_Afd\_14\_9\_b\_top* Box 14:9 (top)  
*enMFPB\_Afd\_16\_9\_b\_centre* Box > 16:9 (centre)  
*enMFPB\_Afd\_4\_3\_centre* 4:3 (centre)  
*enMFPB\_Afd\_16\_9\_centre* 16:9 (centre)  
*enMFPB\_Afd\_14\_9\_centre* 14:9 (centre)  
*enMFPB\_Afd\_4\_3\_sp\_14\_9* 4:3 (with shoot and protect 14:9 centre)  
*enMFPB\_Afd\_16\_9\_sp\_14\_9* 16:9 (with shoot and protect 14:9 centre)  
*enMFPB\_Afd\_16\_9\_sp\_4\_3* 16:9 (with shoot and protect 4:3 centre)  
*eMFPB\_Afd\_Reserved1* Reserved for future use.  
*eMFPB\_Afd\_Reserved2* Reserved for future use.  
*eMFPB\_Afd\_Reserved3* Reserved for future use.  
*eMFPB\_Afd\_Reserved4* Reserved for future use.  
*eMFPB\_Afd\_Reserved5* Reserved for future use.  
*eMFPB\_Afd\_Reserved6* Reserved for future use.

Definition at line 11138 of file DCM.idl.

## 8.21.3.5 enum DCM::DeviceControl::enMFPB\_AfdMode

Active format descriptor.

Enumerator:

*eMFPB\_AfdMode\_Manual* Aspect Ratio Signaling set to a user defined value. (Not supported for HD->HD or SD->SD processing.)

*eMFPB\_AfdMode\_Auto* Follow input and use user configured default as backup. (Not supported for HD->SD processing.)

*eMFPB\_AfdMode\_Reserved1* Reserved for future use.

*eMFPB\_AfdMode\_Reserved2* Reserved for future use.

*eMFPB\_AfdMode\_Reserved3* Reserved for future use.

*eMFPB\_AfdMode\_Reserved4* Reserved for future use.

*eMFPB\_AfdMode\_Reserved5* Reserved for future use.

*eMFPB\_AfdMode\_Reserved6* Reserved for future use.

Definition at line 11126 of file DCM.idl.

## 8.21.3.6 enum DCM::DeviceControl::enMFPB\_AspectRatio\_t

Enumerator:

*enMFPB\_AR\_Unkown*

*enMFPB\_AR\_FollowInput*

*enMFPB\_AR\_4\_3*

*enMFPB\_AR\_16\_9*

*enMFPB\_AR\_14\_9*

*enMFPB\_AR\_Reserved1* Reserved for future use.

*enMFPB\_AR\_Reserved2* Reserved for future use.

*enMFPB\_AR\_Reserved3* Reserved for future use.

*enMFPB\_AR\_Reserved4* Reserved for future use.

*enMFPB\_AR\_Reserved5* Reserved for future use.

*enMFPB\_AR\_Reserved6* Reserved for future use.

*enMFPB\_AR\_Reserved7* Reserved for future use.

*enMFPB\_AR\_Reserved8* Reserved for future use.

Definition at line 10606 of file DCM.idl.

## 8.21.3.7 enum DCM::DeviceControl::enMFPB\_AspectRatioSig

Enumerator:

*eMFPB\_AspectRatioSig\_4\_3* Aspect Ratio Signaling 4:3.

*eMFPB\_AspectRatioSig\_16\_9* Aspect Ratio Signaling 16:9.

*eMFPB\_AspectRatioSig\_14\_9* Aspect Ratio Signaling 14:9.

*eMFPB\_AspectRatioSig\_Reserved1* Reserved for future use.

*eMFPB\_AspectRatioSig\_Reserved2* Reserved for future use.

*eMFPB\_AspectRatioSig\_Reserved3* Reserved for future use.  
*eMFPB\_AspectRatioSig\_Reserved4* Reserved for future use.  
*eMFPB\_AspectRatioSig\_Reserved5* Reserved for future use.  
*eMFPB\_AspectRatioSig\_Reserved6* Reserved for future use.

Definition at line 11112 of file DCM.idl.

#### 8.21.3.8 enum DCM::DeviceControl::enMFPB\_AspectRatioSigMode

Enumerator:

*eMFPB\_AspectRatioModeSig\_Manual* Aspect Ratio Signaling set to a user defined value.  
*eMFPB\_AspectRatioModeSig\_Auto* Follow input and use user configured default as backup.  
*eMFPB\_AspectRatioModeSig\_Reserved1* Reserved for future use.  
*eMFPB\_AspectRatioModeSig\_Reserved2* Reserved for future use.  
*eMFPB\_AspectRatioModeSig\_Reserved3* Reserved for future use.  
*eMFPB\_AspectRatioModeSig\_Reserved4* Reserved for future use.  
*eMFPB\_AspectRatioModeSig\_Reserved5* Reserved for future use.  
*eMFPB\_AspectRatioModeSig\_Reserved6* Reserved for future use.

Definition at line 11100 of file DCM.idl.

#### 8.21.3.9 enum DCM::DeviceControl::enMFPB\_AudioChannelConfiguration\_t

Enumerator:

*eMFPB\_AudioChannelConfig\_Mono* Cannot be used for a audio decoder. Cannot be used in combination with (encoder) format HE\_AACv2.  
*eMFPB\_AudioChannelConfig\_Stereo*  
*eMFPB\_AudioChannelConfig\_ACC\_5\_1* 5.1 Channels. Cannot be used in combination with formats MPEG1\_Layer2 and HE\_AACv2  
*eMFPB\_AudioChannelConfig\_Reserved3* Reserved for future.  
*eMFPB\_AudioChannelConfig\_Reserved4* Reserved for future.  
*eMFPB\_AudioChannelConfig\_Reserved5* Reserved for future.  
*eMFPB\_AudioChannelConfig\_Reserved6* Reserved for future.  
*eMFPB\_AudioChannelConfig\_Reserved7* Reserved for future.  
*eMFPB\_AudioChannelConfig\_Reserved8* Reserved for future.  
*eMFPB\_AudioChannelConfig\_Reserved9* Reserved for future.  
*eMFPB\_AudioChannelConfig\_Reserved10* Reserved for future.

Definition at line 11508 of file DCM.idl.

#### 8.21.3.10 enum DCM::DeviceControl::enMFPB\_AudioFormat\_t

Enumerator:

*eMFPB\_AudioFormat\_MPEG1\_Layer2*  
*eMFPB\_AudioFormat\_AC3*  
*eMFPB\_AudioFormat\_DolbyDigitalPlus*

*eMFPB\_AudioFormat\_DolbyDigitalPulse* Reserved for future.

*eMFPB\_AudioFormat\_LC\_AAC* When used in decoder, this is handled as AAC.

*eMFPB\_AudioFormat\_HE\_AACv1* When used in decoder, this is handled as AAC.

*eMFPB\_AudioFormat\_HE\_AACv2* When used in decoder, this is handled as AAC.

*eMFPB\_AudioFormat\_AAC* Wildcard AAC format: All possible AAC formats, only used for audio decoder settings.

*eMFPB\_AudioFormat\_Reserved9* Reserved for future.

*eMFPB\_AudioFormat\_Reserved10* Reserved for future.

*eMFPB\_AudioFormat\_Reserved11* Reserved for future.

*eMFPB\_AudioFormat\_Reserved12* Reserved for future.

*eMFPB\_AudioFormat\_Reserved13* Reserved for future.

*eMFPB\_AudioFormat\_Reserved14* Reserved for future.

*eMFPB\_AudioFormat\_Reserved15* Reserved for future.

Definition at line 11489 of file DCM.idl.

#### 8.21.3.11 enum DCM::DeviceControl::enMFPB\_AudioProcessingMode\_t

Enumerator:

*eMFPB\_AudioProcessingMode\_Disable* Audio processing is disabled on this board. (Default)

- 4 video engine units of type *eMFPB\_EngineUnitType\_VideoAudio* will be available these engine units can process only video.

*eMFPB\_AudioProcessingMode\_Enable* Audio processing is enabled on this board.

- 3 video engine units of type *eMFPB\_EngineUnitType\_VideoAudio* will be available these engine units can both process video and audio.
- 1 audio only engine unit of type *eMFPB\_EngineUnitType\_AudioOnly* will be available this engine unit can only process audio.

*eMFPB\_AudioProcessingMode\_Reserved3* Reserved for future use.

*eMFPB\_AudioProcessingMode\_Reserved4* Reserved for future use.

*eMFPB\_AudioProcessingMode\_Reserved5* Reserved for future use.

*eMFPB\_AudioProcessingMode\_Reserved6* Reserved for future use.

*eMFPB\_AudioProcessingMode\_Reserved7* Reserved for future use.

*eMFPB\_AudioProcessingMode\_Reserved8* Reserved for future use.

Definition at line 10229 of file DCM.idl.

#### 8.21.3.12 enum DCM::DeviceControl::enMFPB\_AudioSampleRate\_t

Enumerator:

*eMFPB\_AudioSampleRate\_FollowInput*

*eMFPB\_AudioSampleRate\_22\_05KHz* AAC only.

*eMFPB\_AudioSampleRate\_24KHz* AAC only.

*eMFPB\_AudioSampleRate\_32KHz* Not for Dolby formats.

*eMFPB\_AudioSampleRate\_44\_1KHz* Not for Dolby formats.

*eMFPB\_AudioSampleRate\_48KHz*

*eMFPB\_AudioSampleRate\_Reserved1* Reserved for future.  
*eMFPB\_AudioSampleRate\_Reserved2* Reserved for future.  
*eMFPB\_AudioSampleRate\_Reserved3* Reserved for future.  
*eMFPB\_AudioSampleRate\_Reserved4* Reserved for future.  
*eMFPB\_AudioSampleRate\_Reserved5* Reserved for future.

Definition at line 11562 of file DCM.idl.

### 8.21.3.13 enum DCM::DeviceControl::enMFPB\_AudioStatusChannelConfiguration\_t

Enumerator:

*eMFPB\_AudioStatusChannelConfig\_MPEGLII\_1\_0* 1.0  
*eMFPB\_AudioStatusChannelConfig\_MPEGLII\_1\_1* 1+1  
*eMFPB\_AudioStatusChannelConfig\_MPEGLII\_2* 2.0 Stereo  
*eMFPB\_AudioStatusChannelConfig\_MPEGLII\_2\_JS* 2.0 Joint Stereo  
*eMFPB\_AudioStatusChannelConfig\_DD\_1\_0* 1/0  
*eMFPB\_AudioStatusChannelConfig\_DD\_1\_1* 1+1  
*eMFPB\_AudioStatusChannelConfig\_DD\_2\_0* 2/0  
*eMFPB\_AudioStatusChannelConfig\_DD\_3\_0* 3/0  
*eMFPB\_AudioStatusChannelConfig\_DD\_2\_1* 2/1  
*eMFPB\_AudioStatusChannelConfig\_DD\_3\_1* 3/1  
*eMFPB\_AudioStatusChannelConfig\_DD\_2\_2* 2/2  
*eMFPB\_AudioStatusChannelConfig\_DD\_3\_2* 3/2  
*eMFPB\_AudioStatusChannelConfig\_AAC\_1\_0* 1.0  
*eMFPB\_AudioStatusChannelConfig\_AAC\_2\_0* 2.0  
*eMFPB\_AudioStatusChannelConfig\_AAC\_3\_0* 3.0  
*eMFPB\_AudioStatusChannelConfig\_AAC\_4\_0* 4.0  
*eMFPB\_AudioStatusChannelConfig\_AAC\_5\_0* 5.0  
*eMFPB\_AudioStatusChannelConfig\_AAC\_5\_1* 5.1  
*eMFPB\_AudioStatusChannelConfig\_AAC\_7\_1* 7.1, Reserved for future use  
*eMFPB\_AudioStatusChannelConfig\_Reserved1* Reserved for future.  
*eMFPB\_AudioStatusChannelConfig\_Reserved2* Reserved for future.  
*eMFPB\_AudioStatusChannelConfig\_Reserved3* Reserved for future.  
*eMFPB\_AudioStatusChannelConfig\_Reserved4* Reserved for future.  
*eMFPB\_AudioStatusChannelConfig\_Reserved5* Reserved for future.  
*eMFPB\_AudioStatusChannelConfig\_Reserved6* Reserved for future.  
*eMFPB\_AudioStatusChannelConfig\_Reserved7* Reserved for future.  
*eMFPB\_AudioStatusChannelConfig\_Reserved8* Reserved for future.  
*eMFPB\_AudioStatusChannelConfig\_Reserved9* Reserved for future.  
*eMFPB\_AudioStatusChannelConfig\_Reserved10* Reserved for future.  
*eMFPB\_AudioStatusChannelConfig\_Reserved11* Reserved for future.  
*eMFPB\_AudioStatusChannelConfig\_Reserved12* Reserved for future.  
*eMFPB\_AudioStatusChannelConfig\_Reserved13* Reserved for future.

*eMFPB\_AudioStatusChannelConfig\_Reserved14* Reserved for future.

*eMFPB\_AudioStatusChannelConfig\_Reserved15* Reserved for future.

*eMFPB\_AudioStatusChannelConfig\_Reserved16* Reserved for future.

Definition at line 11523 of file DCM.idl.

#### 8.21.3.14 enum DCM::DeviceControl::enMFPB\_AudioStatusSampleRate\_t

Enumerator:

*eMFPB\_AudioStatusSampleRate\_22\_05KHz* 22,05 kHz

*eMFPB\_AudioStatusSampleRate\_24KHz* 24 kHz

*eMFPB\_AudioStatusSampleRate\_32KHz* 32 kHz

*eMFPB\_AudioStatusSampleRate\_44\_1KHz* 44,1 kHz

*eMFPB\_AudioStatusSampleRate\_48KHz* 48 kHz

*eMFPB\_AudioStatusSampleRate\_96KHz* 96 KHz

*eMFPB\_AudioStatusSampleRate\_88\_2KHz* 88,2 KHz

*eMFPB\_AudioStatusSampleRate\_64KHz* 64 KHz

*eMFPB\_AudioStatusSampleRate\_16KHz* 16 KHz

*eMFPB\_AudioStatusSampleRate\_12KHz* 12 KHz

*eMFPB\_AudioStatusSampleRate\_11\_025KHz* 11,025 KHz

*eMFPB\_AudioStatusSampleRate\_8KHz* 8 KHz

*eMFPB\_AudioStatusSampleRate\_7\_35KHz* 7,35 KHz

*eMFPB\_AudioStatusSampleRate\_Reserved1* Reserved for future.

*eMFPB\_AudioStatusSampleRate\_Reserved2* Reserved for future.

*eMFPB\_AudioStatusSampleRate\_Reserved3* Reserved for future.

*eMFPB\_AudioStatusSampleRate\_Reserved4* Reserved for future.

*eMFPB\_AudioStatusSampleRate\_Reserved5* Reserved for future.

*eMFPB\_AudioStatusSampleRate\_Reserved6* Reserved for future.

*eMFPB\_AudioStatusSampleRate\_Reserved7* Reserved for future.

*eMFPB\_AudioStatusSampleRate\_Reserved8* Reserved for future.

*eMFPB\_AudioStatusSampleRate\_Reserved9* Reserved for future.

*eMFPB\_AudioStatusSampleRate\_Reserved10* Reserved for future.

*eMFPB\_AudioStatusSampleRate\_Reserved11* Reserved for future.

*eMFPB\_AudioStatusSampleRate\_Reserved12* Reserved for future.

*eMFPB\_AudioStatusSampleRate\_Reserved14* Reserved for future.

*eMFPB\_AudioStatusSampleRate\_Reserved15* Reserved for future.

*eMFPB\_AudioStatusSampleRate\_Reserved16* Reserved for future.

Definition at line 11577 of file DCM.idl.

## 8.21.3.15 enum DCM::DeviceControl::enMFPB\_BitrateMode

Enumerator:

- eMFPB\_BitrateMode\_CBR* Encoder rate control outputs with constant bit rate. ES stuffing when needed.
- eMFPB\_BitrateMode\_CappedVBR* Encoder rate control outputs with a max bit rate. No ES stuffing when lower.
- eMFPB\_BitrateMode\_Statmux* No local rate control algorithm is used. Bit rate is managed by external statistical multiplex controller.
- eMFPB\_BitrateMode\_Reserved4* Reserved for future use.
- eMFPB\_BitrateMode\_Reserved5* Reserved for future use.
- eMFPB\_BitrateMode\_Reserved6* Reserved for future use.

Definition at line 10961 of file DCM.idl.

## 8.21.3.16 enum DCM::DeviceControl::enMFPB\_ClosedCaptionFormat\_t

Enumerator:

- eMFPB\_ClosedCaptionFormat\_None* Input contains no closed captions.
- eMFPB\_ClosedCaptionFormat\_SA\_Type\_4* Reserved for future use.
- eMFPB\_ClosedCaptionFormat\_SCTE20* SCTE-20, reserved for future use.
- eMFPB\_ClosedCaptionFormat\_EAI708* SCTE-21 / CEA 708.
- eMFPB\_ClosedCaptionFormat\_Unkown* Input contains a unknown closed caption format.
- eMFPB\_ClosedCaptionFormat\_SCTE21\_608B* SCTE-21 / CEA 608.
- eMFPB\_ClosedCaptionFormat\_SCTE21\_4* SCTE 21 - Type 4, reserved for future use.
- eMFPB\_ClosedCaptionFormat\_Reserved5* Reserved for future use.
- eMFPB\_ClosedCaptionFormat\_Reserved6* Reserved for future use.

Definition at line 10587 of file DCM.idl.

## 8.21.3.17 enum DCM::DeviceControl::enMFPB\_ClosedCaptions\_t

Enumerator:

- eMFPB\_ClosedCaptions\_Disable* Disable closed captions at the output.
- eMFPB\_ClosedCaptions\_Auto* Copy closed caption from decoder if available, else empty CEA 708 closed caption fields will be present.
- eMFPB\_ClosedCaptions\_TestField1* Reserved for future use, Test Pattern: Field 1.
- eMFPB\_ClosedCaptions\_TestField2* Reserved for future use, Test Pattern: Field 2.
- eMFPB\_ClosedCaptions\_TestField1\_2* Reserved for future use, Test Pattern: Field 1 and 2.
- eMFPB\_ClosedCaptions\_Manual* Reserved for future use, Manual.
- eMFPB\_ClosedCaptions\_Reserved5* Reserved for future use.
- eMFPB\_ClosedCaptions\_Reserved6* Reserved for future use.
- eMFPB\_ClosedCaptions\_Reserved7* Reserved for future use.
- eMFPB\_ClosedCaptions\_Reserved8* Reserved for future use.
- eMFPB\_ClosedCaptions\_Reserved9* Reserved for future use.
- eMFPB\_ClosedCaptions\_Reserved10* Reserved for future use.

Definition at line 10984 of file DCM.idl.

## 8.21.3.18 enum DCM::DeviceControl::enMFPB\_Dolby\_BitStreamMode

Enumerator:

*eMFPB\_BSM\_CompleteMain* CompleteMain/Main.

*eMFPB\_BSM\_MusicAndEffects*

*eMFPB\_BSM\_VisualImpaired*

*eMFPB\_BSM\_HearingImpaired*

*eMFPB\_BSM\_Dialog*

*eMFPB\_BSM\_Commentary*

*eMFPB\_BSM\_EmergencyFlash*

*eMFPB\_BSM\_MainMinusDialogue* For status only.

*eMFPB\_DR\_Reserved6* For Future functionality.

Definition at line 12086 of file DCM.idl.

#### 8.21.3.22 enum DCM::DeviceControl::enMFPB\_Dolby\_SurroundExMode

Extended Surround Mode.

Version

Release 10.10

Enumerator:

*eMFPB\_DSExt\_NotIndicated*  
*eMFPB\_DSExt\_Disabled* Not Encoded in Dolby Digital Surround EX.  
*eMFPB\_DSExt\_Enabled* Encoded in Dolby Digital Surround EX.  
*eMFPB\_DSExt\_Reserverd1* For Future functionality.  
*eMFPB\_DSExt\_Reserverd2* For Future functionality.  
*eMFPB\_DSExt\_Reserverd3* For Future functionality.  
*eMFPB\_DSExt\_Reserverd4* For Future functionality.

Definition at line 12234 of file DCM.idl.

**8.21.3.23 enum DCM::DeviceControl::enMFPB\_Dolby\_SurroundMode**

Enumerator:

*eMFPB\_DS\_NotIndicated*  
*eMFPB\_DS\_Disabled*  
*eMFPB\_DS\_Enabled*  
*eMFPB\_DS\_Reserver3* For Future functionality.  
*eMFPB\_DS\_Reserver4* For Future functionality.  
*eMFPB\_DS\_Reserver5* For Future functionality.  
*eMFPB\_DS\_Reserver6* For Future functionality.

Definition at line 12075 of file DCM.idl.

**8.21.3.24 enum DCM::DeviceControl::enMFPB\_DolbyDec\_DynComp**

Dolby Dynamic Compression Mode.

Version

Release 10.10

Enumerator:

*eMFPB\_DolbyDec\_DynComp\_Line*  
*eMFPB\_DolbyDec\_DynComp\_RF*  
*eMFPB\_DolbyDec\_DynComp\_Custom*  
*eMFPB\_DolbyDec\_DynComp\_None*  
*eMFPB\_DolbyDec\_DynComp\_Reserved1* For Future functionality.  
*eMFPB\_DolbyDec\_DynComp\_Reserved2* For Future functionality.  
*eMFPB\_DolbyDec\_DynComp\_Reserved3* For Future functionality.  
*eMFPB\_DolbyDec\_DynComp\_Reserved4* For Future functionality.

Definition at line 12520 of file DCM.idl.

**8.21.3.25 enum DCM::DeviceControl::enMFPB\_Downmix\_ToMono**

Select dual mono channels to keep when converting to mono.

Version

Release 10.10

Enumerator:

*eMFPB\_Downmix\_ToMono\_Left* Keep left channel.  
*eMFPB\_Downmix\_ToMono\_Right* Keep right channel.  
*eMFPB\_Downmix\_ToMono\_Split* For Future functionality, keep both channels but as 2 mono channels. Put right channel on new PID.  
*eMFPB\_Downmix\_ToMono\_Reserved1* For Future functionality.  
*eMFPB\_Downmix\_ToMono\_Reserved2* For Future functionality.  
*eMFPB\_Downmix\_ToMono\_Reserved3* For Future functionality.  
*eMFPB\_Downmix\_ToMono\_Reserved4* For Future functionality.

Definition at line 12372 of file DCM.idl.

## 8.21.3.26 enum DCM::DeviceControl::enMFPB\_Downmix\_ToStereo

Select channels to keep when converting to stereo/dual mono.

## Version

Release 10.10

## Enumerator:

*eMFPB\_Downmix\_ToStereo\_LTRT*

*eMFPB\_Downmix\_ToStereo\_LORO*

*eMFPB\_Downmix\_ToStereo\_Auto*

*eMFPB\_Downmix\_ToStereo\_NotIndicated* Do not indicate how to downconvert in dolby Meta data.

Only use this in Dolby encoder settings.

*eMFPB\_Downmix\_ToStereo\_Reserved2* For Future functionality.

*eMFPB\_Downmix\_ToStereo\_Reserved3* For Future functionality.

*eMFPB\_Downmix\_ToStereo\_Reserved4* For Future functionality.

*eMFPB\_Downmix\_ToStereo\_Reserved5* For Future functionality.

*eMFPB\_Downmix\_ToStereo\_Reserved6* For Future functionality.

Definition at line 12201 of file DCM.idl.

## 8.21.3.27 enum DCM::DeviceControl::enMFPB\_EngineUnitMode\_t

## Enumerator:

*eMFPB\_EngineUnitMode\_SD\_Transprocess* 6 SD transrating/coding of video + audio processing.

*eMFPB\_EngineUnitMode\_HD\_Transprocess* 2 HD transrating/coding of video + audio processing.

*eMFPB\_EngineUnitMode\_SD\_HD\_Transprocess* 3 SD and 1 HD transrating/coding of video + audio processing.

*eMFPB\_EngineUnitMode\_SD\_Splice* 6 SD splicing and transrating/coding of video + audio processing.

*eMFPB\_EngineUnitMode\_HD\_Splice* 1 HD splicing and transrating/coding of video + audio processing.

*eMFPB\_EngineUnitMode\_AudioOnly* All slots of a EngineUnitType audio only are always audio only.

*eMFPB\_EngineUnitMode\_MultiRes* V12.0: all slots of a EngineUnitType MultiRes are always - MultiRes only.

*eMFPB\_EngineUnitMode\_Reserved7* Reserved for future use.

*eMFPB\_EngineUnitMode\_Reserved8* Reserved for future use.

*eMFPB\_EngineUnitMode\_Reserved9* Reserved for future use.

*eMFPB\_EngineUnitMode\_Reserved10* Reserved for future use.

*eMFPB\_EngineUnitMode\_Reserved11* Reserved for future use.

*eMFPB\_EngineUnitMode\_Reserved12* Reserved for future use.

*eMFPB\_EngineUnitMode\_Reserved13* Reserved for future use.

*eMFPB\_EngineUnitMode\_Reserved14* Reserved for future use.

*eMFPB\_EngineUnitMode\_Reserved15* Reserved for future use.

Definition at line 10357 of file DCM.idl.

**8.21.3.28 enum DCM::DeviceControl::enMFPB\_EngineUnitType\_t**

Enumerator:

- eMFPB\_EngineUnitType\_VideoAudio* Video and or Audio processing (see MFPB\_BoardCfg), on this engine a audio component will only be processed if the respective video is processed.
- eMFPB\_EngineUnitType\_AudioOnly* On this engine you can only process audio. However services passed to this type can contain video, the video will be delayed with the same value.
- eMFPB\_EngineUnitType\_Reserved1* Reserved for future use.
- eMFPB\_EngineUnitType\_Reserved2* Reserved for future use.
- eMFPB\_EngineUnitType\_Reserved3* Reserved for future use.
- eMFPB\_EngineUnitType\_Reserved4* Reserved for future use.
- eMFPB\_EngineUnitType\_Reserved5* Reserved for future use.
- eMFPB\_EngineUnitType\_Reserved6* Reserved for future use.

Definition at line 10344 of file DCM.idl.

**8.21.3.29 enum DCM::DeviceControl::enMFPB\_EntropyEncoding\_t**

Enumerator:

- eMFPB\_EntropyEncoding\_Auto*
- eMFPB\_EntropyEncoding\_CAVLC*
- eMFPB\_EntropyEncoding\_CABAC* Not allowed in case of baseline profile.
- eMFPB\_EntropyEncoding\_Reserved1*
- eMFPB\_EntropyEncoding\_Reserved2*
- eMFPB\_EntropyEncoding\_Reserved3*

Definition at line 11330 of file DCM.idl.

**8.21.3.30 enum DCM::DeviceControl::enMFPB\_ExtendedBSI\_Mode**

Extended BSI Mode.

Version

Release 10.10

Enumerator:

- eMFPB\_ExtendedBSI\_Mode\_Standard*
- eMFPB\_ExtendedBSI\_Mode\_XBSI*
- eMFPB\_ExtendedBSI\_Mode\_Reserved1* For Future functionality.
- eMFPB\_ExtendedBSI\_Mode\_Reserved2* For Future functionality.
- eMFPB\_ExtendedBSI\_Mode\_Reserved3* For Future functionality.
- eMFPB\_ExtendedBSI\_Mode\_Reserved4* For Future functionality.
- eMFPB\_ExtendedBSI\_Mode\_Reserved5* For Future functionality.
- eMFPB\_ExtendedBSI\_Mode\_Reserved6* For Future functionality.

Definition at line 12218 of file DCM.idl.

## 8.21.3.31 enum DCM::DeviceControl::enMFPB\_FrameRate\_t

Enumerator:

*eMFPB\_FrameRate\_FollowInput* Frame rate follows the frame rate of the input.

*eMFPB\_FrameRate\_Reduction* Framerate will be defined by enMFPB\_FrameRateReduction (.  
See also

[MFPB\\_VideoEncoderTemplate\\_t](#)). Reserved for future use.

*eMFPB\_FrameRate\_24Hz* Reserved for future use.

*eMFPB\_FrameRate\_25Hz* Frame rate in Hz, applies to SD and HD, reserved for future use.

*eMFPB\_FrameRate\_29\_97Hz* Frame rate in Hz, applies to SD and HD, reserved for future use.

*eMFPB\_FrameRate\_30Hz* Frame rate in Hz, applies to SD and HD, reserved for future use.

*eMFPB\_FrameRate\_50Hz* Frame rate in Hz, applies to HD, reserved for future use.

*eMFPB\_FrameRate\_59\_94Hz* Frame rate in Hz, applies to HD, reserved for future use.

*eMFPB\_FrameRate\_60Hz* Frame rate in Hz, applies to HD, reserved for future use.

*eMFPB\_FrameRate\_Reserved9* Reserved for future use.

*eMFPB\_FrameRate\_Reserved10* Reserved for future use.

*eMFPB\_FrameRate\_Reserved11* Reserved for future use.

*eMFPB\_FrameRate\_Reserved12* Reserved for future use.

Definition at line 10889 of file DCM.idl.

## 8.21.3.32 enum DCM::DeviceControl::enMFPB\_FrameRateReduction\_t

Enumerator:

*eMFPB\_FrameRateReduction\_None* Framerate will be defined by enMFPB\_FrameRate (.  
See also

[MFPB\\_VideoEncoderTemplate\\_t](#))

*eMFPB\_FrameRateReduction\_1\_over\_2* Reserved for future use.

*eMFPB\_FrameRateReduction\_1\_over\_3* Reserved for future use.

*eMFPB\_FrameRateReduction\_1\_over\_4* Reserved for future use.

*eMFPB\_FrameRateReduction\_1\_over\_5* Reserved for future use.

*eMFPB\_FrameRateReduction\_1\_over\_6* Reserved for future use.

*eMFPB\_FrameRateReduction\_1\_over\_30* Reserved for future use.

*eMFPB\_FrameRateReduction\_1\_over\_60* Reserved for future use.

*eMFPB\_FrameRateReduction\_Reserved9* Reserved for future use.

*eMFPB\_FrameRateReduction\_Reserved10* Reserved for future use.

*eMFPB\_FrameRateReduction\_Reserved11* Reserved for future use.

*eMFPB\_FrameRateReduction\_Reserved12* Reserved for future use.

Definition at line 10906 of file DCM.idl.

## 8.21.3.33 enum DCM::DeviceControl::enMFPB\_GopStructure\_t

Enumerator:

- eMFPB\_GS\_FollowInput* Reserved for future use: Mpeg2 and Avc: Follow input GOP size and structure. (GOP size, B-pictures, (AVC) IDR are ignored)
- eMFPB\_GS\_Fixed* In the GUI this is called "Custom". Mpeg2 and Avc: Fixed GOP size (can be violated), the number of B frames and (AVC) IDR interval.
- eMFPB\_GS\_Dynamic* Mpeg2 and Avc: The maximum number GOP size.(B-pictures are ignored)
- eMFPB\_GS\_KeepClosed* Mpeg2 and Avc: Keep closed GOP's (GOP size, B-pictures are ignored)
- eMFPB\_GS\_HardFixed* Mpeg2 and Avc: Fixed GOP size (guaranteed), the number of B frames and (AVC) IDR interval.
- eMFPB\_GS\_Reserved2* Reserved for future use (Close GOPs (GOP size, B-pictures, (AVC) IDR are ignored) )
- eMFPB\_GS\_Reserved3* Reserved for future use (Keep I Frames (GOP size, B-pictures, (AVC) IDR are ignored) )
- eMFPB\_GS\_Reserved4* Reserved for future use.
- eMFPB\_GS\_Reserved5* Reserved for future use.

Definition at line 10971 of file DCM.idl.

## 8.21.3.34 enum DCM::DeviceControl::enMFPB\_HorizResolution\_t

Enumerator:

- eMFPB\_HR\_FollowInput* Width follows the width of the input.
- eMFPB\_HR\_FollowInputAspectRatio* Width follows the aspect (width/height) ratio of the input.
- eMFPB\_HR\_CustomResolution* Reserved for future use.
- eMFPB\_HR\_96* Width in pixels, applies to PIP, reserved for future use.
- eMFPB\_HR\_128* Width in pixels, applies to PIP, reserved for future use.
- eMFPB\_HR\_176* Width in pixels, applies to PIP, reserved for future use.
- eMFPB\_HR\_192* Width in pixels, applies to PIP, reserved for future use.
- eMFPB\_HR\_320* Width in pixels, applies to SD, can be used for horizontal scaling.
- eMFPB\_HR\_352* Width in pixels, applies to SD, can be used for horizontal scaling.
- eMFPB\_HR\_384* Width in pixels, reserved for future use.
- eMFPB\_HR\_480* Width in pixels, applies to SD, can be used for horizontal scaling.
- eMFPB\_HR\_528* Width in pixels, applies to SD, can be used for horizontal scaling.
- eMFPB\_HR\_544* Width in pixels, applies to SD, can be used for horizontal scaling.
- eMFPB\_HR\_640* Width in pixels, applies to SD, can be used for horizontal scaling.
- eMFPB\_HR\_704* Width in pixels, applies to SD, can be used for horizontal scaling.
- eMFPB\_HR\_720* Width in pixels, applies to SD, reserved for future use.
- eMFPB\_HR\_854* Width in pixels, reserved for future use.
- eMFPB\_HR\_960* Width in pixels, applies to HD, reserved for future use.
- eMFPB\_HR\_1024* Width in pixels, reserved for future use.
- eMFPB\_HR\_1080* Reserved for future use.
- eMFPB\_HR\_1152* Reserved for future use.

- eMFPB\_HR\_1280* Width in pixels, applies to HD, reserved for future use.
- eMFPB\_HR\_1408* Width in pixels, applies to HD, reserved for future use.
- eMFPB\_HR\_1440* Width in pixels, applies to HD, reserved for future use.
- eMFPB\_HR\_1920* Width in pixels, applies to HD, reserved for future use.
- eMFPB\_HR\_368* Width in pixels, applies to SD, can be used for horizontal scaling.
- eMFPB\_HR\_Ratio\_1\_2* Width in relation to horizontal input resolution, applies to HD horizontal scaling. 1/2 of input HR, only used if input HR is 1920 or 1280 else the behavior is like Follow-Input.
- eMFPB\_HR\_Ratio\_2\_3* Width in relation to horizontal input resolution, applies to HD horizontal scaling. 2/3 of input HR, only used if input HR is 1920 else the behavior is like FollowInput.
- eMFPB\_HR\_Ratio\_3\_4* Width in relation to horizontal input resolution, applies to HD horizontal scaling. 3/4 of input HR, only used if input HR is 1920 or 1280 else the behavior is like Follow-Input.
- eMFPB\_HR\_Reserved1* Reserved for future use.
- eMFPB\_HR\_Reserved2* Reserved for future use.
- eMFPB\_HR\_Reserved3* Reserved for future use.
- eMFPB\_HR\_Reserved4* Reserved for future use.
- eMFPB\_HR\_Reserved5* Reserved for future use.
- eMFPB\_HR\_Reserved6* Reserved for future use.
- eMFPB\_HR\_Reserved7* Reserved for future use.
- eMFPB\_HR\_Reserved8* Reserved for future use.
- eMFPB\_HR\_Reserved9* Reserved for future use.
- eMFPB\_HR\_Reserved10* Reserved for future use.
- eMFPB\_HR\_Reserved11* Reserved for future use.
- eMFPB\_HR\_Reserved12* Reserved for future use.
- eMFPB\_HR\_Reserved13* Reserved for future use.
- eMFPB\_HR\_Reserved14* Reserved for future use.

*eMFPB\_Level\_Reserved5*

Definition at line 11306 of file DCM.idl.

**8.21.3.36 enum DCM::DeviceControl::enMFPB\_MaxBitrateDescrMode\_t**

Enumerator:

*eMFPB\_MaxBitrateDescrMode\_Passthrough* Use the input descriptor (default value)  
*eMFPB\_MaxBitrateDescrMode\_Generate* An ES level maximum bitrate descriptor will be generated that matches the bitrate after transcoding. Any service level descriptor is passed through.

Definition at line 10413 of file DCM.idl.

**8.21.3.37 enum DCM::DeviceControl::enMFPB\_MetaDataPass\_t**

Setting of how meta data should be passed between decoder and encoder.

Version

Release 10.20

Enumerator:

*enMFPB\_MetaDataCfg\_Auto* Pass Meta data from decoder to encoder automatically. The result depend on varous factors but the state can be checked with eg.

See also

[MFPB\\_DD\\_MetaDecStatusGetL](#)

*enMFPB\_MetaDataCfg\_Manual* No Meta data is passed from decoder to encoder. The encoder meta data is generated based on the manual settings. (eg.

## 8.21.4 Function Documentation

**8.21.4.1** void DCM::DeviceControl::MFP\_RequestReset ( in unsigned short *BoardNr* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Request to restart the DCM\_MFP application and restore the current state.

## Version

Release 10.0 Description of how a Multi format processor (MFP) board should handle audio processing. Only used for 9900 chassis

**8.21.4.2** void DCM::DeviceControl::MFPB\_AACAudioCfgGetL ( in unsigned short *BoardNr*, in IPS\_Service\_List\_t *ServiceList*, out MFPB\_AacAudioCfgList\_t *AacAudioCfgList* ) raises (TimeOut, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)

Get the AAC audio processing settings.

## Parameters

|     |                        |                                                                      |
|-----|------------------------|----------------------------------------------------------------------|
| in  | <i>BoardNr</i>         | The Multi format processor (MFP) board to retrieve the settings from |
| in  | <i>ServiceList</i>     | The list of services of interest.                                    |
| out | <i>AacAudioCfgList</i> | The AAC Audio settings                                               |

## Exceptions

|                        |                                                                                                       |
|------------------------|-------------------------------------------------------------------------------------------------------|
| <i>OperationFailed</i> | in case: <ul style="list-style-type: none"> <li>invalid input references are used (RefSvc)</li> </ul> |
|------------------------|-------------------------------------------------------------------------------------------------------|

## Version

Release 10.0

**8.21.4.3** void DCM::DeviceControl::MFPB\_AACAudioCfgSetL ( in unsigned short *BoardNr*, in MFPB\_AacAudioCfgList\_t *AacAudioCfgList* ) raises (TimeOut, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported, LicenseError)

Set the AAC audio processing settings.

## Parameters

|    |                        |                                                                        |
|----|------------------------|------------------------------------------------------------------------|
| in | <i>BoardNr</i>         | The Multi format processor (MFP) board for which to configure encoding |
| in | <i>AacAudioCfgList</i> | The AAC Audio settings                                                 |

## Note

The TrackingID must always correspond to a encoder tracking ID configured with AudioEncodeCfg-SetL(..). \*

**Exceptions**

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Version

Release 10.0

**8.21.4.22** void DCM::DeviceControl::MFPB\_DolbyAudioCfgSetL ( in unsigned short *BoardNr*, in MFPB\_DolbyAudioCfgList\_t *DolbyAudioCfgList* ) raises (TimeOut, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported, LicenseError)

Set the dolby audio processing settings.

## Parameters

|    |                           |                                                                        |
|----|---------------------------|------------------------------------------------------------------------|
| in | <i>BoardNr</i>            | The Multi format processor (MFP) board for which to configure encoding |
| in | <i>DolbyAudio-CfgList</i> | The dolby Audio settings                                               |

## Note

The TrackingID must always correspond to a encoder tracking ID configured with AudioEncodeCfg-SetL(..). \*

## Exceptions

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i>  | When BoardNr = 0 = Main or the board is not a Multi format processor (MFP) board.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <i>OperationFailed</i> | in case: <ul style="list-style-type: none"> <li>• audio processing is disabled on this board</li> <li>• invalid input references are used (RefSvc)</li> <li>• no Audio encoder was configured</li> <li>• Audio encoder with format different from DolbyDigitalPlus or DolbyDigital-Pulse was configured</li> <li>• if the configuration cannot be accepted by the processing engine mode</li> <li>• invalid settings are passed: <ul style="list-style-type: none"> <li>– IMainMixingLevel too high/low</li> <li>– ...</li> </ul> </li> <li>• There are no more processing resources available</li> </ul> |

## Version

Release 10.0

**8.21.4.23** void DCM::DeviceControl::MFPB\_DolbyAudioCfgSetL\_V2 ( in unsigned short *BoardNr*, in MFPB\_DolbyAudioCfgList\_V2\_t *DolbyAudioCfgList* ) raises (TimeOut, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported, LicenseError)

Set the dolby audio processing settings.

## Parameters

|    |                           |                                                                        |
|----|---------------------------|------------------------------------------------------------------------|
| in | <i>BoardNr</i>            | The Multi format processor (MFP) board for which to configure encoding |
| in | <i>DolbyAudio-CfgList</i> | The dolby Audio settings                                               |

**Note**

The TrackingID must always correspond to a encoder tracking ID configured with AudioEncodeCfg-SetL(..). \*

**Exceptions**

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| <i>OperationFailed</i> | in case: <ul style="list-style-type: none"> <li>• audio processing is disabled on this board</li> <li>• invalid input references are used (RefSvc)</li> <li>• no Audio encoder was configured</li> <li>• Audio encoder with format different from DolbyDigitalPlus or DolbyDigital-Pulse was configured</li> <li>• if the configuration cannot be accepted by the processing engine mode</li> <li>• invalid settings are passed:               <ul style="list-style-type: none"> <li>– IMainMixingLevel too high/low</li> <li>– ...</li> </ul> </li> <li>• There are no more processing resources available</li> </ul> |

**Version**

Release 10.0

**8.21.4.24** void DCM::DeviceControl::MFPB\_GetBoardCfg ( in unsigned short *SlotNbr*, out MFPB\_BoardCfg\_t *MFPB\_BoardCfg* ) raises (TimeOut, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)

Get Board Configuration of a Multi format processor (MFP) board.

**Parameters**

|     |                      |                                                              |
|-----|----------------------|--------------------------------------------------------------|
| in  | <i>SlotNbr</i>       | The slot number of a MFP board to retrieve the settings from |
| out | <i>MFPB_BoardCfg</i> | The MFP board configuration.                                 |

**Exceptions**

|                       |                                                          |
|-----------------------|----------------------------------------------------------|
| <i>OpNotSupported</i> | When BoardNr = 0 = Main or the board is not a MFP board. |
|-----------------------|----------------------------------------------------------|

**Version**

Release 10.0

**8.21.4.25** void DCM::DeviceControl::MFPB\_GetEngineUnitCfg ( in unsigned short *BoardNr*, in RefProcessorEngineUnitList\_t *RefProcessorEngineUnitList*, out MFPB\_EngineUnitCfgList\_t *EngineUnitCfgList* ) raises (TimeOut, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)

Get the current configuration of the Multi format processor (MFP) engine unit.

This configuration determines how many SD, HD, audio, PIP and multi resolution streams the MFP engine can handle.

**Parameters**

|     |                                   |                                                                                                                 |
|-----|-----------------------------------|-----------------------------------------------------------------------------------------------------------------|
| in  | <i>BoardNr</i>                    | The Multi format processor (MFP) board to retrieve the settings from                                            |
| in  | <i>RefProcessorEngineUnitList</i> | List of engine references to get information about. If empty, the function returns information for all engines. |
| out | <i>EngineUnitCfgList</i>          | A list of configuration data                                                                                    |

**Exceptions**

|                        |                                                                                     |

| <i>OpNotSupported</i>  | When BoardNr = 0 = Main or the board is not a Multi format processor (MFP) board.   |
| <i>OperationFailed</i> | <ul style="list-style-type: none"> <li>Invalid ProcessorEngine reference</li> </ul> |

**Version**

Release 10.0

**8.21.4.26** void DCM::DeviceControl::MFPB\_GetMfpResourcesLoad ( in unsigned short *BoardNr*, out ResourcesLoad\_List\_t *ResourcesLoad\_List* ) raises (TimeOut, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)

Get measured load of MFP resources.

**Parameters**

|     |                           |                                              |
|-----|---------------------------|----------------------------------------------|
| in  | <i>BoardNr</i>            | The MFP board to retrieve the settings from. |
| out | <i>ResourcesLoad_List</i> | List with the load of MFP resources.         |

**Exceptions**

|                       |                                                          |
|-----------------------|----------------------------------------------------------|
| <i>OpNotSupported</i> | When BoardNr = 0 = Main or the board is not a MFP board. |
|-----------------------|----------------------------------------------------------|

**Version**

Release 10.10

**8.21.4.27** void DCM::DeviceControl::MFPB\_GetMPEG2FramePicturesCfg ( in unsigned short *BoardNr*, out MFPB\_MPEG2FramePicturesCfgList\_t *MPEG2FramePicturesCfgList* ) raises (TimeOut, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)

Get the current configuration of MPEG-2 Frame Pictures engine unit.

#### Parameters

|     |                                  |                                                                      |
|-----|----------------------------------|----------------------------------------------------------------------|
| in  | <i>BoardNr</i>                   | The Multi format processor (MFP) board to retrieve the settings from |
| out | <i>MPEG2FramePicturesCfgList</i> | List of all "MPEG-2 Frame Picture configurations" for this board.    |

#### Exceptions

|                       |                                                                                   |
|-----------------------|-----------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When BoardNr = 0 = Main or the board is not a Multi format processor (MFP) board. |
|-----------------------|-----------------------------------------------------------------------------------|

#### Version

Release 10.0.11

**8.21.4.28** void DCM::DeviceControl::MFPB\_GetMultiResABR ( in unsigned short *SlotNbr*, in IPS\_RefSvc\_List\_t *RefSvcList*, out MFPB\_MultiResABR\_List\_t *MultiResABR\_List* ) raises (TimeOut, OperationFailed, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the ABR settings for all multi resolution services belonging to one particular main service.

#### Parameters

|     |                         |                                                                                             |
|-----|-------------------------|---------------------------------------------------------------------------------------------|
| in  | <i>SlotNbr</i>          | The Multi format processor (MFP) board to apply the settings to                             |
| in  | <i>RefSvcList</i>       | A list of multi resolution services to delete.                                              |
| out | <i>MultiResABR_List</i> | The ABR settings for all multi resolution services belonging to the specified main service. |

#### Exceptions

|                        |                                                                                                 |
|------------------------|-------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i>  | When BoardNr is not a Multi format processor (MFP) board.                                       |
| <i>OperationFailed</i> | in case: <ul style="list-style-type: none"> <li>invalid references are used (RefSvc)</li> </ul> |

#### Version

Release 11.10

**8.21.4.29** void DCM::DeviceControl::MFPB\_MetaDataCfgGetL ( in unsigned short *BoardNr*, in IPS\_Service\_List\_t *ServiceList*, out MFPB\_ServiceMetaDataCfgList\_t *MetaDataCfgList* ) raises (TimeOut, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)

Get the audio meta data configuration.

**Parameters**

|     |                         |                                                                      |
|-----|-------------------------|----------------------------------------------------------------------|
| in  | <i>BoardNr</i>          | The Multi format processor (MFP) board to retrieve the settings from |
| in  | <i>ServiceList</i>      | The list of services of interest.                                    |
| out | <i>MetaDataCfg-List</i> | The with the current settings                                        |

**Exceptions**

|                        |                                                                                                       |

| <i>OperationFailed</i> | in case: <ul style="list-style-type: none"> <li>audio processing is disabled on this board</li> <li>invalid input references are used (RefSvc)</li> <li>no Audio decoder was configured</li> <li>invalid settings are passed</li> </ul> |

**Version**

Release 10.20

**8.21.4.31** void DCM::DeviceControl::MFPB\_MPEGL2AudioCfgGetL ( in unsigned short *BoardNr*, in IPS\_Service\_List\_t *ServiceList*, out MFPB\_MPEGL2AudioCfgList\_t *MPEGL2AudioCfgList* ) raises (TimeOut, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)

Get the MPEG1-L2 audio processing settings.

**Parameters**

|     |                            |                                                                      |
|-----|----------------------------|----------------------------------------------------------------------|
| in  | <i>BoardNr</i>             | The Multi format processor (MFP) board to retrieve the settings from |
| in  | <i>ServiceList</i>         | The list of services of interest.                                    |
| out | <i>MPEGL2-AudioCfgList</i> | The MPEG1-L2 Audio settings                                          |

**Exceptions**

|                        |                                                                                                       |
|------------------------|-------------------------------------------------------------------------------------------------------|
| <i>OperationFailed</i> | in case: <ul style="list-style-type: none"> <li>invalid input references are used (RefSvc)</li> </ul> |
|------------------------|-------------------------------------------------------------------------------------------------------|

**Version**

Release 10.10

**8.21.4.32** void DCM::DeviceControl::MFPB\_MPEGL2AudioCfgSetL ( in unsigned short *BoardNr*, in MFPB\_MPEGL2AudioCfgList\_t *MPEGL2AudioCfgList* ) raises (TimeOut, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported, LicenseError)

Set the MPEG1-L2 audio processing settings.

**Parameters**

|    |                            |                                                                        |
|----|----------------------------|------------------------------------------------------------------------|
| in | <i>BoardNr</i>             | The Multi format processor (MFP) board for which to configure encoding |
| in | <i>MPEGL2-AudioCfgList</i> | The MPEG1-L2 Audio settings                                            |

**Note**

The TrackingID must always correspond to a encoder tracking ID configured with AudioEncodeCfg-SetL(..). \*

## Exceptions

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Version

Release 10.10

**8.21.4.33** void DCM::DeviceControl::MFPB\_MultiResVideoEncodeCfgGetL ( in IPS\_RefSvc\_t *MainService*, out MFPB\_MultiResVideoEncodeCfgList\_t *MultiResVideoEncodeCfgList* ) raises (TimeOut, OperationFailed, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the video encoding settings for the multi resolution services belonging to one particular main service.

## Parameters

|     |                                   |                                                                                                        |
|-----|-----------------------------------|--------------------------------------------------------------------------------------------------------|
| in  | <i>MainService</i>                | The main service from which to retrieve the multi resolution video encodings settings                  |
| out | <i>MultiResVideoEncodeCfgList</i> | The video encoding settings for all multi resolution services belonging to the specified main service. |

## Exceptions

|                        |                                                                                                   |
|------------------------|---------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i>  | When BoardNr is not a Multi format processor (MFP) board.                                         |
| <i>OperationFailed</i> | in case: <ul style="list-style-type: none"> <li>• invalid references are used (RefSvc)</li> </ul> |

## Version

Release 11.10

**8.21.4.34** void DCM::DeviceControl::MFPB\_MultiResVideoEncodeCfgSetL ( in IPS\_RefSvc\_t *MainService*, in MFPB\_MultiResVideoEncodeCfgList\_t *MultiResVideoEncodeCfgList* ) raises (TimeOut, OperationFailed, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

Create and or set the video encoding settings for one or more multi resolution services belonging to one particular main service.

**Parameters**

|    |                                   |                                                                              |
|----|-----------------------------------|------------------------------------------------------------------------------|
| in | <i>MainService</i>                | The main service for which to configure the multi resolution video encodings |
| in | <i>MultiResVideoEncodeCfgList</i> | The video encoding settings for each multi resolution service                |

**Note**

The TrackingID must always correspond to a video decode tracking ID configured with VideoDecodeCfgSetL(..). The [IPS\\_RefSvc\\_t](#) parameter in the VideoEncodeCfgList must match with an earlier created multi resolution service unless it is set to INVALID (all fields set to INVALID\_REF or INVALID\_SID). When set to INVALID, a new multi resolution service will be created with the given video settings. A new [IPS\\_RefSvc\\_t](#) and User Tag will be automatically allocated for this service.

**Exceptions**

|                        |                                                                                                                                                                                                                                                                     |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i>  | When BoardNr = 0 = Main or the board is not a Multi format processor (MFP) board.                                                                                                                                                                                   |
| <i>OperationFailed</i> | in case: <ul style="list-style-type: none"> <li>• invalid references are used (RefSvc)</li> <li>• no video decode was configured</li> <li>• if the configuration cannot be accepted by the processing engine mode</li> <li>• invalid settings are passed</li> </ul> |

**Version**

Release 11.10

**8.21.4.35** void DCM::DeviceControl::MFPB\_MultiResVideoEncodeDeleteL ( in IPS\_RefSvc\_t *MainService*, in IPS\_RefSvc\_List\_t *RefSvcList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Delete one or more multi resolution services on a MFP board from a particular main service.

The service is only deleted if the service is not passed anymore to an IO board.

**Parameters**

|    |                    |                                                                                     |
|----|--------------------|-------------------------------------------------------------------------------------|
| in | <i>MainService</i> | The main service from which to delete the multi resolution video encodings settings |
| in | <i>RefSvcList</i>  | A list of multi resolution services to delete.                                      |

**Exceptions**

|                       |                                                                                                                                                                                                                                                            |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Release 10.0

**8.21.4.41** void DCM::DeviceControl::MFPB\_SetEngineUnitCfg ( in unsigned short *BoardNr*, in MFPB\_EngineUnitCfgList\_t *EngineUnitCfgList* ) raises (TimeOut, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)

Apply a new processor engine unit configuration on a Multi format processor (MFP) board.

This can cause interruptions in some or all processed streams.

**Parameters**

|    |                           |                                                                |
|----|---------------------------|----------------------------------------------------------------|
| in | <i>BoardNr</i>            | The Multi format processor (MFP) board to set the settings to. |
| in | <i>EngineUnit-CfgList</i> | A list of configuration data                                   |

**Exceptions**

|                        |                                                                                                                                                                                              |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Get video status information.

Information is only available for video streams which are currently being processed.

**Parameters**

|     |                      |                                                                           |
|-----|----------------------|---------------------------------------------------------------------------|
| in  | <i>BoardNr</i>       | The Multi format processor (MFP) board for which to configure processing. |
| in  | <i>ServiceList</i>   | The list of services of interest.                                         |
| out | <i>VideoInfoList</i> | The status of the video streams.                                          |

**Exceptions**

|                        |                                                                                                                 |
|------------------------|-----------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i>  | When BoardNr = 0 = Main or the board is not a Multi format processor (MFP) board.                               |
| <i>OperationFailed</i> | In case: <ul style="list-style-type: none"><li>• invalid input references are used (BoardNr, RefSvc).</li></ul> |

**Version**

Release 10.0

## 8.22 Logo Insertion

This contains specific types, enums and methods for controlling the logo insertion part of the device.

### Classes

- struct [DCM::DeviceControl::FontCfg\\_t](#)
- struct [DCM::DeviceControl::LogoCfg\\_t](#)
- struct [DCM::DeviceControl::MaximumLogoSize\\_t](#)
- struct [DCM::DeviceControl::LogoCfgFileNumber\\_t](#)
- struct [DCM::DeviceControl::Color\\_t](#)
- struct [DCM::DeviceControl::BannerCfg\\_t](#)
- struct [DCM::DeviceControl::BannerCfg\\_V2\\_t](#)
- struct [DCM::DeviceControl::TC\\_Banner\\_t](#)
- struct [DCM::DeviceControl::TC\\_Banner\\_V2\\_t](#)
- struct [DCM::DeviceControl::TC\\_BannerSettings\\_t](#)
- struct [DCM::DeviceControl::TC\\_BannerStatus\\_t](#)
- struct [DCM::DeviceControl::TC\\_ServiceBannerStatus\\_t](#)
- struct [DCM::DeviceControl::TC\\_LogoSetting\\_t](#)
- struct [DCM::DeviceControl::TC\\_Logo\\_t](#)
- struct [DCM::DeviceControl::TC\\_LogoDisplay\\_t](#)
- struct [DCM::DeviceControl::TC\\_ServiceLogoDisplay\\_t](#)
- struct [DCM::DeviceControl::TC\\_LogoCfg\\_t](#)
- struct [DCM::DeviceControl::TC\\_LogoKeyerID\\_t](#)
- struct [DCM::DeviceControl::TC\\_ServiceLogoCfgID\\_t](#)

### Typedefs

- typedef unsigned long [DCM::DeviceControl::FontCfgID\\_t](#)
- typedef sequence< FontCfgID\_t > [DCM::DeviceControl::FontCfgID\\_List\\_t](#)
- typedef sequence< FontCfg\_t > [DCM::DeviceControl::FontCfgList\\_t](#)
- typedef unsigned long [DCM::DeviceControl::LogoCfgID\\_t](#)
- typedef sequence< LogoCfgID\_t > [DCM::DeviceControl::LogoCfgID\\_List\\_t](#)
- typedef sequence< LogoCfg\_t > [DCM::DeviceControl::LogoCfgList\\_t](#)
- typedef unsigned long [DCM::DeviceControl::LogoFileNumber\\_t](#)
- typedef sequence< LogoCfgFileNumber\_t > [DCM::DeviceControl::LogoCfgFileNumberList\\_t](#)
- typedef unsigned long [DCM::DeviceControl::BannerCfgID\\_t](#)
- typedef sequence< BannerCfgID\_t > [DCM::DeviceControl::BannerCfgID\\_List\\_t](#)
- typedef sequence< BannerCfg\_t > [DCM::DeviceControl::BannerCfgList\\_t](#)
- typedef sequence< BannerCfg\_V2\_t > [DCM::DeviceControl::BannerCfg\\_V2\\_List\\_t](#)
- typedef sequence< TC\_BannerSettings\_t > [DCM::DeviceControl::TC\\_BannerSettingsList\\_t](#)
- typedef sequence< TC\_BannerStatus\_t > [DCM::DeviceControl::TC\\_BannerStatusList\\_t](#)
- typedef sequence< TC\_ServiceBannerStatus\_t > [DCM::DeviceControl::TC\\_ServiceBannerStatusList\\_t](#)
- typedef unsigned long [DCM::DeviceControl::TC\\_ServiceLogoID\\_t](#)
- typedef sequence< TC\_LogoSetting\_t > [DCM::DeviceControl::TC\\_LogoSettingList\\_t](#)
- typedef sequence< TC\_Logo\_t > [DCM::DeviceControl::TC\\_LogoList\\_t](#)
- typedef sequence< TC\_LogoDisplay\_t > [DCM::DeviceControl::TC\\_LogoDisplayList\\_t](#)
- typedef sequence< TC\_ServiceLogoDisplay\_t > [DCM::DeviceControl::TC\\_ServiceLogoDisplayList\\_t](#)

- typedef sequence < TC\_LogoCfg\_t > DCM::DeviceControl::TC\_LogoCfgList\_t
- typedef unsigned long DCM::DeviceControl::TC\_KeyerID\_t
- typedef sequence < TC\_LogoKeyerID\_t > DCM::DeviceControl::TC\_LogoKeyerID\_List\_t
- typedef sequence < TC\_ServiceLogoCfgID\_t > DCM::DeviceControl::TC\_ServiceLogoCfgID\_List\_t

### Enumerations

- enum DCM::DeviceControl::enTC\_BoardMode\_t { DCM::DeviceControl::eTC\_BoardMode\_Transcode, DCM::DeviceControl::eTC\_BoardMode\_LogoInsertion, DCM::DeviceControl::eTC\_BoardMode\_Reserved\_1, DCM::DeviceControl::eTC\_BoardMode\_Reserved\_2, DCM::DeviceControl::eTC\_BoardMode\_Reserved\_3, DCM::DeviceControl::eTC\_BoardMode\_Reserved\_4, DCM::DeviceControl::eTC\_BoardMode\_Reserved\_5 }
- Processor board mode.*
- enum DCM::DeviceControl::enLogoPayoutMode\_t { DCM::DeviceControl::eLogoPayout\_Normal, DCM::DeviceControl::eLogoPayout\_Palindrome, DCM::DeviceControl::eLogoPayout\_Reserved\_1, DCM::DeviceControl::eLogoPayout\_Reserved\_2, DCM::DeviceControl::eLogoPayout\_Reserved\_3 }
- Playout modes for animated logos.*
- enum DCM::DeviceControl::enTC\_LogoCfgSource\_t { DCM::DeviceControl::eTC\_LogoCfgSource\_Local, DCM::DeviceControl::eTC\_LogoCfgSource\_SCTE35, DCM::DeviceControl::eTC\_LogoCfgSource\_Reserved1, DCM::DeviceControl::eTC\_LogoCfgSource\_Reserved2, DCM::DeviceControl::eTC\_LogoCfgSource\_Reserved3 }
- enum DCM::DeviceControl::enBannerTextEncoding\_t { DCM::DeviceControl::eBannerTextEncoding\_ASCII, DCM::DeviceControl::eBannerTextEncoding\_UTF8, DCM::DeviceControl::eBannerTextEncoding\_Reserved3, DCM::DeviceControl::eBannerTextEncoding\_Reserved4, DCM::DeviceControl::eBannerTextEncoding\_Reserved5, DCM::DeviceControl::eBannerTextEncoding\_Reserved6, DCM::DeviceControl::eBannerTextEncoding\_Reserved7, DCM::DeviceControl::eBannerTextEncoding\_Reserved8 }
- enum DCM::DeviceControl::enBannerStopType\_t { DCM::DeviceControl::eBannerStopType\_Direct, DCM::DeviceControl::eBannerStopType\_OnLoop, DCM::DeviceControl::eBannerStopType\_Reserved3, DCM::DeviceControl::eBannerStopType\_Reserved4, DCM::DeviceControl::eBannerStopType\_Reserved5, DCM::DeviceControl::eBannerStopType\_Reserved6, DCM::DeviceControl::eBannerStopType\_Reserved7, DCM::DeviceControl::eBannerStopType\_Reserved8 }
- enum DCM::DeviceControl::enTC\_AllowedBanner\_t { DCM::DeviceControl::eTC\_AllowedBanner\_None, DCM::DeviceControl::eTC\_AllowedBanner\_Text\_Only, DCM::DeviceControl::eTC\_AllowedBanner\_Text\_Static, DCM::DeviceControl::eTC\_AllowedBanner\_Text\_Animated, DCM::DeviceControl::eTC\_AllowedBanner\_Reserved1, DCM::DeviceControl::eTC\_AllowedBanner\_Reserved2, DCM::DeviceControl::eTC\_AllowedBanner\_Reserved3, DCM::DeviceControl::eTC\_AllowedBanner\_Reserved4 }
- enum DCM::DeviceControl::enTC\_BannerPriority\_t { DCM::DeviceControl::eTC\_BannerPriority\_Keep\_Logos, DCM::DeviceControl::eTC\_BannerPriority\_Remove\_Logos, DCM::DeviceControl::eTC\_BannerPriority\_Reserved1, DCM::DeviceControl::eTC\_BannerPriority\_Reserved2, DCM::DeviceControl::eTC\_BannerPriority\_Reserved3 }
- enum DCM::DeviceControl::enTC\_EAS\_Control\_t { DCM::DeviceControl::eTC\_EAS\_Control\_Disabled, DCM::DeviceControl::eTC\_EAS\_Control\_Enabled, DCM::DeviceControl::eTC\_EAS\_Control\_Reserved1, DCM::DeviceControl::eTC\_EAS\_Control\_Reserved2, DCM::DeviceControl::eTC\_EAS\_Control\_Reserved3 }

## Functions

- void [DCM::DeviceControl::LogoLibrary\\_Add](#) (in LogoCfg\_t LogoCfg, in string FileFormat, in - ByteStream Logo) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Add a logo to the logo library.*

- void [DCM::DeviceControl::LogoLibrary\\_ExportLogo](#) (in LogoCfgID\_t LogoCfgID, in string FileFormat, out ByteStream Logo) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Export (=download) a logo from the logo library.*

- void [DCM::DeviceControl::LogoLibrary\\_LogoCfgGetL](#) (in LogoCfgID\_List\_t LogoCfgID\_List, out LogoCfgList\_t LogoCfgList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get information about logos in the logo library.*

- void [DCM::DeviceControl::LogoLibrary\\_LogoCfgSetL](#) (in LogoCfgList\_t LogoCfgList) raises (- Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Update about certain logos in the logo library.*

- void [DCM::DeviceControl::LogoLibrary\\_LogoCfgDeleteL](#) (in LogoCfgID\_List\_t LogoCfgID\_List) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Remove one or more logos from the logo library.*

- void [DCM::DeviceControl::LogoLibrary\\_LogoCfgFileNrGetL](#) (in LogoCfgID\_List\_t LogoCfgID\_List, out LogoCfgFileNumberList\_t LogoCfgFileNumbers) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the mapping between LogoCfgID and LogoFileNumber.*

- void [DCM::DeviceControl::LogoLibrary\\_LogoCfgFileNrSetL](#) (in LogoCfgFileNumberList\_t LogoCfgFileNumbers) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Set the mapping between LogoCfgID and LogoFileNumber.*

- void [DCM::DeviceControl::LogoLibrary\\_SetMaxLogoSize](#) (in MaximumLogoSize\_t MaxLogoSize) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Set device-wide maximum logo size.*

- void [DCM::DeviceControl::LogoLibrary\\_GetMaxLogoSize](#) (out MaximumLogoSize\_t MaxLogoSize) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the device-wide maximum logo size.*

- void [DCM::DeviceControl::FontLibrary\\_Add](#) (in FontCfg\_t FontCfg, in string FileFormat, in ByteStream Font) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Add a Font to the Font library.*

- void [DCM::DeviceControl::FontLibrary\\_FontCfgGetL](#) (in FontCfgID\_List\_t FontCfgID\_List, out - FontCfgList\_t FontCfgList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get information about fonts in the font library.*

- void [DCM::DeviceControl::FontLibrary\\_FontCfgSetL](#) (in FontCfgList\_t FontCfgList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Update certain Fonts in the Font library.*

- void [DCM::DeviceControl::FontLibrary\\_FontCfgDeleteL](#) (in FontCfgID\_List\_t FontCfgID\_List) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Remove one or more Fonts from the Font library.*

- void [DCM::DeviceControl::BannerLibrary\\_Add](#) (in BannerCfg\_t BannerCfg) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Add a Banner to the Banner library.*

- void [DCM::DeviceControl::BannerLibrary\\_V2\\_Add](#) (in BannerCfg\_V2\_t BannerCfg) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Add a Banner to the Banner library.*

- void [DCM::DeviceControl::BannerLibrary\\_BannerCfgGetL](#) (in BannerCfgID\_List\_t BannerCfgID\_List, out BannerCfgList\_t BannerCfgList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get information about Banners in the Banner library.*

- void [DCM::DeviceControl::BannerLibrary\\_BannerCfg\\_V2\\_GetL](#) (in BannerCfgID\_List\_t BannerCfgID\_List, out BannerCfg\_V2\_List\_t BannerCfgList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get information about Banners in the Banner library.*

- void [DCM::DeviceControl::BannerLibrary\\_BannerCfgSetL](#) (in BannerCfgList\_t BannerCfgList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Update certain Banners in the Banner library.*

- void [DCM::DeviceControl::BannerLibrary\\_BannerCfg\\_V2\\_SetL](#) (in BannerCfg\_V2\_List\_t BannerCfgList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Update certain Banners in the Banner library.*

- void [DCM::DeviceControl::BannerLibrary\\_BannerCfgDeleteL](#) (in BannerCfgID\_List\_t BannerCfgID\_List) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Remove one or more Banners from the Banner library.*

- void [DCM::DeviceControl::TC\\_GetBoardMode](#) (in unsigned short BoardNr, out enTC\_BoardMode\_t enBoardMode) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the processor board mode.*

- void [DCM::DeviceControl::TC\\_SetBoardMode](#) (in unsigned short BoardNr, in enTC\_BoardMode\_t enBoardMode) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Set the processor board mode.*

- void [DCM::DeviceControl::TC\\_LogoCfgSetL](#) (in unsigned short BoardNr, in TC\_LogoCfgList\_t LogoCfgList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Update the logo settings on the logo processing board.*

- void [DCM::DeviceControl::TC\\_LogoKeyerGetL](#) (in unsigned short BoardNr, in IPS\_Service\_List\_t SvcList, out TC\_LogoKeyerID\_List\_t LogoKeyerIDs) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the current logo ID to keyer ID mapping.*

- void [DCM::DeviceControl::TC\\_LogoKeyerUpdateL](#) (in unsigned short BoardNr, in TC\_LogoKeyerID\_List\_t LogoKeyerIDs) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Update the LogoID <-> Keyer ID mapping .*

- void [DCM::DeviceControl::TC\\_LogoAddL](#) (in unsigned short BoardNr, in TC\_ServiceLogoCfgID\_List\_t LogoToAdd) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

*Add one or more logo configurations to one or more services.*

- void [DCM::DeviceControl::TC\\_LogoDeleteL](#) (in unsigned short BoardNr, in TC\_ServiceLogoCfgID\_List\_t LogosToDelete) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Remove one or more logo configurations from one or more services.*

- void [DCM::DeviceControl::TC\\_LogoGetL](#) (in unsigned short BoardNr, in IPS\_Service\_List\_t ServiceList, out TC\_LogoList\_t LogoList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get logo transcoding settings.*

- void [DCM::DeviceControl::TC\\_LogoDisplayL](#) (in unsigned short BoardNr, in TC\_ServiceLogoDisplayList\_t LogoDisplayList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Update the display status of logos.*

- void [DCM::DeviceControl::TC\\_BannerSettingsGetL](#) (in unsigned short BoardNr, in IPS\_Service\_List\_t ServiceList, out TC\_BannerSettingsList\_t BannerSettingsList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get the banner configuration.*
- void [DCM::DeviceControl::TC\\_BannerSettingsSetL](#) (in unsigned short BoardNr, in TC\_BannerSettingsList\_t BannerSettingsList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)  
*Update the banner configuration.*
- void [DCM::DeviceControl::TC\\_StartBanner](#) (in unsigned short BoardNr, in IPS\_Service\_List\_t - ServiceList, in TC\_Banner\_t Banner) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)  
*Start a banner.*
- void [DCM::DeviceControl::TC\\_StartBanner\\_V2](#) (in unsigned short BoardNr, in IPS\_Service\_List\_t ServiceList, in TC\_Banner\_V2\_t Banner) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)  
*Start a banner.*
- void [DCM::DeviceControl::TC\\_BannerStatusGetL](#) (in unsigned short BoardNr, in IPS\_Service\_List\_t ServiceList, out TC\_ServiceBannerStatusList\_t Banners) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)  
*Retrieve the list of banner statuses.*
- void [DCM::DeviceControl::StartEAS](#) (in string SAME, in string AlertText, in unsigned long BannerTimeout) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Start an EAS message.*
- void [DCM::DeviceControl::StartEAS\\_V2](#) (in string SAME, in string AlertText, in unsigned long - BannerTimeout, in enBannerTextEncoding\_t AlertTextEncoding) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Start an EAS message.*
- void [DCM::DeviceControl::StartEAS\\_V3](#) (in string SAME, in string AlertText, in unsigned long - BannerTimeout, in enBannerTextEncoding\_t AlertTextEncoding, in unsigned short TextLoopCount) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Start an EAS message.*
- void [DCM::DeviceControl::TC\\_StopBanner](#) (in unsigned short BoardNr, in IPS\_Service\_List\_t - ServiceList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Stop any banner in the service This will stop any active banner (and EAS) in all of the listed services.*
- void [DCM::DeviceControl::StopBanners](#) () raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Stop all banners on all services This will stop any active banner (and EAS) on any logo insertion board.*
- unsigned short [DCM::DeviceControl::TC\\_GetDSP\\_Number](#) (in unsigned short SlotNbr, in IPS\_RefPid\_t RefPid) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get the DSP currently processing a certain PID.*

### 8.22.1 Detailed Description

This contains specific types, enums and methods for controlling the logo insertion part of the device.

### 8.22.2 Typedef Documentation

#### 8.22.2.1 typedef sequence<BannerCfg\_V2\_t> DCM::DeviceControl::BannerCfg\_V2\_List\_t

Definition at line 13983 of file DCM.idl.

**8.22.2.2** `typedef sequence<BannerCfgID_t> DCM::DeviceControl::BannerCfgID_List_t`

Definition at line 13879 of file DCM.idl.

**8.22.2.3** `typedef unsigned long DCM::DeviceControl::BannerCfgID_t`

Definition at line 13878 of file DCM.idl.

**8.22.2.4** `typedef sequence<BannerCfg_t> DCM::DeviceControl::BannerCfgList_t`

Definition at line 13916 of file DCM.idl.

**8.22.2.5** `typedef sequence<FontCfgID_t> DCM::DeviceControl::FontCfgID_List_t`

Definition at line 13780 of file DCM.idl.

**8.22.2.6** `typedef unsigned long DCM::DeviceControl::FontCfgID_t`

Definition at line 13779 of file DCM.idl.

**8.22.2.7** `typedef sequence<FontCfg_t> DCM::DeviceControl::FontCfgList_t`

Definition at line 13793 of file DCM.idl.

**8.22.2.8** `typedef sequence<LogoCfgFileNumber_t> DCM::DeviceControl::LogoCfgFileNumberList_t`

Definition at line 13860 of file DCM.idl.

**8.22.2.9** `typedef sequence<LogoCfgID_t> DCM::DeviceControl::LogoCfgID_List_t`

Definition at line 13796 of file DCM.idl.

**8.22.2.10** `typedef unsigned long DCM::DeviceControl::LogoCfgID_t`

Definition at line 13795 of file DCM.idl.

**8.22.2.11** `typedef sequence<LogoCfg_t> DCM::DeviceControl::LogoCfgList_t`

Definition at line 13845 of file DCM.idl.

**8.22.2.12** `typedef unsigned long DCM::DeviceControl::LogoFileNumber_t`

Definition at line 13853 of file DCM.idl.

**8.22.2.13** `typedef sequence<TC_BannerSettings_t> DCM::DeviceControl::TC_BannerSettingsList_t`

Definition at line 14045 of file DCM.idl.

**8.22.2.14** `typedef sequence<TC_BannerStatus_t> DCM::DeviceControl::TC_BannerStatusList_t`

Definition at line 14052 of file DCM.idl.

**8.22.2.15** `typedef unsigned long DCM::DeviceControl::TC_KeyerID_t`

Definition at line 14102 of file DCM.idl.

**8.22.2.16** `typedef sequence<TC_LogoCfg_t> DCM::DeviceControl::TC_LogoCfgList_t`

Definition at line 14100 of file DCM.idl.

**8.22.2.17** `typedef sequence<TC_LogoDisplay_t> DCM::DeviceControl::TC_LogoDisplayList_t`

Definition at line 14084 of file DCM.idl.

**8.22.2.18** `typedef sequence<TC_LogoKeyerID_t> DCM::DeviceControl::TC_LogoKeyerID_List_t`

Definition at line 14110 of file DCM.idl.

**8.22.2.19** `typedef sequence<TC_Logo_t> DCM::DeviceControl::TC_LogoList_t`

Definition at line 14076 of file DCM.idl.

**8.22.2.20** `typedef sequence<TC_LogoSetting_t> DCM::DeviceControl::TC_LogoSettingList_t`

Definition at line 14069 of file DCM.idl.

**8.22.2.21** `typedef sequence<TC_ServiceBannerStatus_t> DCM::DeviceControl::TC_ServiceBanner-  
StatusList_t`

Definition at line 14059 of file DCM.idl.

**8.22.2.22** `typedef sequence<TC_ServiceLogoCfgID_t> DCM::DeviceControl::TC_ServiceLogoCfgID-  
_List_t`

Definition at line 14118 of file DCM.idl.

**8.22.2.23** `typedef sequence<TC_ServiceLogoDisplay_t> DCM::DeviceControl::TC_ServiceLogo-  
DisplayList_t`

Definition at line 14091 of file DCM.idl.

**8.22.2.24** `typedef unsigned long DCM::DeviceControl::TC_ServiceLogoID_t`

Definition at line 14061 of file DCM.idl.

### 8.22.3 Enumeration Type Documentation

**8.22.3.1** `enum DCM::DeviceControl::enBannerStopType_t`

Enumerator:

- eBannerStopType\_Direct* Banner stops immediately.
- eBannerStopType\_OnLoop* Banner stops if current loop is finished.
- eBannerStopType\_Reserved3* Reserved for future use.
- eBannerStopType\_Reserved4* Reserved for future use.
- eBannerStopType\_Reserved5* Reserved for future use.
- eBannerStopType\_Reserved6* Reserved for future use.
- eBannerStopType\_Reserved7* Reserved for future use.
- eBannerStopType\_Reserved8* Reserved for future use.

Definition at line 13931 of file DCM.idl.

**8.22.3.2 enum DCM::DeviceControl::enBannerTextEncoding\_t**

Enumerator:

*eBannerTextEncoding\_ASCII* ASCII-Latin1 ISO-8859-1.  
*eBannerTextEncoding\_UTF8* UTF-8.  
*eBannerTextEncoding\_Reserved3* Reserved for future use.  
*eBannerTextEncoding\_Reserved4* Reserved for future use.  
*eBannerTextEncoding\_Reserved5* Reserved for future use.  
*eBannerTextEncoding\_Reserved6* Reserved for future use.  
*eBannerTextEncoding\_Reserved7* Reserved for future use.  
*eBannerTextEncoding\_Reserved8* Reserved for future use.

Definition at line 13918 of file DCM.idl.

**8.22.3.3 enum DCM::DeviceControl::enLogoPlayoutMode\_t**

Playout modes for animated logos.

Enumerator:

*eLogoPlayout\_Normal* once forward  
*eLogoPlayout\_Palindrome* once forward, once reverse  
*eLogoPlayout\_Reserved\_1* not supported yet  
*eLogoPlayout\_Reserved\_2* not supported yet  
*eLogoPlayout\_Reserved\_3* not supported yet

Definition at line 13799 of file DCM.idl.

**8.22.3.4 enum DCM::DeviceControl::enTC\_AllowedBanner\_t**

Enumerator:

*eTC\_AllowedBanner\_None*  
*eTC\_AllowedBanner\_Text\_Only* A text crawl without logos.  
*eTC\_AllowedBanner\_Text\_Static* A text crawl and one or more static logos.  
*eTC\_AllowedBanner\_Text\_Animated* A text crawl and one or more static or animated logos.  
*eTC\_AllowedBanner\_Reserved1* Reserved for future use.  
*eTC\_AllowedBanner\_Reserved2* Reserved for future use.  
*eTC\_AllowedBanner\_Reserved3* Reserved for future use.  
*eTC\_AllowedBanner\_Reserved4* Reserved for future use.

Definition at line 14008 of file DCM.idl.

**8.22.3.5 enum DCM::DeviceControl::enTC\_BannerPriority\_t**

Enumerator:

*eTC\_BannerPriority\_Keep\_Logos* Do not remove active logos (unless there are not enough resources)

*eTC\_BannerPriority\_Remove\_Logos* Remove logos before activating the banner.

*eTC\_BannerPriority\_Reserved1* Reserved for future use.

*eTC\_BannerPriority\_Reserved2* Reserved for future use.

*eTC\_BannerPriority\_Reserved3* Reserved for future use.

Definition at line 14020 of file DCM.idl.

#### 8.22.3.6 enum DCM::DeviceControl::enTC\_BoardMode\_t

Processor board mode.

Enumerator:

*eTC\_BoardMode\_Transcode* Processor board only supports video, audio & PIP transcodes.

*eTC\_BoardMode\_LogoInsertion* Processor board only supports logo insertion.

*eTC\_BoardMode\_Reserved\_1* not supported yet

*eTC\_BoardMode\_Reserved\_2* not supported yet

*eTC\_BoardMode\_Reserved\_3* not supported yet

*eTC\_BoardMode\_Reserved\_4* not supported yet

*eTC\_BoardMode\_Reserved\_5* not supported yet

Definition at line 13768 of file DCM.idl.

#### 8.22.3.7 enum DCM::DeviceControl::enTC\_EAS\_Control\_t

Enumerator:

*eTC\_EAS\_Control\_Disabled* Do not insert EAS alerts.

*eTC\_EAS\_Control\_Enabled* Insert EAS alerts.

*eTC\_EAS\_Control\_Reserved1* Reserved for future use.

*eTC\_EAS\_Control\_Reserved2* Reserved for future use.

*eTC\_EAS\_Control\_Reserved3* Reserved for future use.

Definition at line 14029 of file DCM.idl.

#### 8.22.3.8 enum DCM::DeviceControl::enTC\_LogoCfgSource\_t

Enumerator:

*eTC\_LogoCfgSource\_Local*

*eTC\_LogoCfgSource\_SCTE35*

*eTC\_LogoCfgSource\_Reserved1*

*eTC\_LogoCfgSource\_Reserved2*

*eTC\_LogoCfgSource\_Reserved3*

Definition at line 13862 of file DCM.idl.

## 8.22.4 Function Documentation

**8.22.4.1** void DCM::DeviceControl::BannerLibrary\_Add ( in BannerCfg\_t *BannerCfg* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Add a Banner to the Banner library.

## Parameters

|    |                  |                                   |
|----|------------------|-----------------------------------|
| in | <i>BannerCfg</i> | Configuration data of the Banner. |
|----|------------------|-----------------------------------|

## Exceptions

|                       |                                                                                                                                                                                                                                     |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | in case: <ul style="list-style-type: none"> <li>the Banner is not a valid Banner.</li> <li>no more entries are available (maximum 256 Banners).</li> <li>a Banner of the same name already exists in the Banner library.</li> </ul> |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Version

Release 8.2

**8.22.4.2** void DCM::DeviceControl::BannerLibrary\_BannerCfg\_V2\_GetL ( in BannerCfgID\_List\_t *BannerCfgID\_List*, out BannerCfg\_V2\_List\_t *BannerCfgList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get information about Banners in the Banner library.

## Parameters

|     |                         |                                                                                                           |
|-----|-------------------------|-----------------------------------------------------------------------------------------------------------|
| in  | <i>BannerCfgID_List</i> | List of Banner ID's to get information about. If empty, the function returns information for all Banners. |
| out | <i>BannerCfgList</i>    | A list of Banner configuration data                                                                       |

## Version

Release 8.9

**8.22.4.3** void DCM::DeviceControl::BannerLibrary\_BannerCfg\_V2\_SetL ( in BannerCfg\_V2\_List\_t *BannerCfgList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Update certain Banners in the Banner library.

## Parameters

|    |                      |                                     |
|----|----------------------|-------------------------------------|
| in | <i>BannerCfgList</i> | A list of Banner configuration data |
|----|----------------------|-------------------------------------|

**Exceptions**

|                       |                                                                                                                                                                                                                                                     |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | in case: <ul style="list-style-type: none"> <li>• one of the Banner ID's is not valid.</li> <li>• one of elements in the list is not valid, e.g. if one of the elements. defines a Banner name which another Banner already has as name.</li> </ul> |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Version**

Release 8.9

**8.22.4.4** void DCM::DeviceControl::BannerLibrary\_BannerCfgDeleteL ( in BannerCfgID\_List\_t *BannerCfgID\_List* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Remove one or more Banners from the Banner library.

**Parameters**

|    |                         |                               |
|----|-------------------------|-------------------------------|
| in | <i>BannerCfgID_List</i> | ID's of the Banners to remove |
|----|-------------------------|-------------------------------|

**Exceptions**

|                       |                                                                                                                                                           |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | in case of: <ul style="list-style-type: none"> <li>• one of the Banner ID's is invalid.</li> <li>• one of the Banner configurations is in use.</li> </ul> |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|

**Version**

Release 8.2

**8.22.4.5** void DCM::DeviceControl::BannerLibrary\_BannerCfgGetL ( in BannerCfgID\_List\_t *BannerCfgID\_List*, out BannerCfgList\_t *BannerCfgList* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get information about Banners in the Banner library.

**Parameters**

|     |                         |                                                                                                           |
|-----|-------------------------|-----------------------------------------------------------------------------------------------------------|
| in  | <i>BannerCfgID_List</i> | List of Banner ID's to get information about. If empty, the function returns information for all Banners. |
| out | <i>BannerCfgList</i>    | A list of Banner configuration data                                                                       |

**Version**

Release 8.2

**8.22.4.6** void DCM::DeviceControl::BannerLibrary\_BannerCfgSetL ( in BannerCfgList\_t *BannerCfgList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Update certain Banners in the Banner library.

**Parameters**

|    |                      |                                     |
|----|----------------------|-------------------------------------|
| in | <i>BannerCfgList</i> | A list of Banner configuration data |
|----|----------------------|-------------------------------------|

**Exceptions**

|                       |                                                                                                                                                                                                                                                     |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | in case: <ul style="list-style-type: none"> <li>• one of the Banner ID's is not valid.</li> <li>• one of elements in the list is not valid, e.g. if one of the elements. defines a Banner name which another Banner already has as name.</li> </ul> |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Version**

Release 8.2

**8.22.4.7** void DCM::DeviceControl::BannerLibrary\_V2\_Add ( in BannerCfg\_V2\_t *BannerCfg* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Add a Banner to the Banner library.

**Parameters**

|    |                  |                                   |
|----|------------------|-----------------------------------|
| in | <i>BannerCfg</i> | Configuration data of the Banner. |
|----|------------------|-----------------------------------|

**Exceptions**

|                       |                                                                                                                                                                                                                                           |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | in case: <ul style="list-style-type: none"> <li>• the Banner is not a valid Banner.</li> <li>• no more entries are available (maximum 256 Banners).</li> <li>• a Banner of the same name already exists in the Banner library.</li> </ul> |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Version**

Release 8.9

**8.22.4.8** void DCM::DeviceControl::FontLibrary\_Add ( in FontCfg\_t *FontCfg*, in string *FileFormat*, in ByteStream *Font* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Add a Font to the Font library.

**Parameters**

|    |                   |                                                             |
|----|-------------------|-------------------------------------------------------------|
| in | <i>FontCfg</i>    | Configuration data of the Font.                             |
| in | <i>FileFormat</i> | Indicates how the Font data is encoded. This must be "ttf". |
| in | <i>Font</i>       | The Font data. This must be a TrueTypeFont (ttf) file.      |

**Exceptions**

|                       |                                                                                                                                                                                                                           |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | in case: <ul style="list-style-type: none"> <li>the Font is not a valid Font.</li> <li>no more entries are available (maximum 128 Fonts).</li> <li>a Font of the same name already exists in the Font library.</li> </ul> |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Version**

Release 8.2

**8.22.4.9** void DCM::DeviceControl::FontLibrary\_FontCfgDeleteL ( in FontCfgID\_List\_t *FontCfgID\_List* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Remove one or more Fonts from the Font library.

**Parameters**

|    |                       |                             |
|----|-----------------------|-----------------------------|
| in | <i>FontCfgID_List</i> | ID's of the Fonts to remove |
|----|-----------------------|-----------------------------|

**Exceptions**

|                       |                                                                                                                                                   |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | in case of: <ul style="list-style-type: none"> <li>one of the Font ID's is invalid.</li> <li>one of the Font configurations is in use.</li> </ul> |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|

**Version**

Release 8.2

**8.22.4.10** void DCM::DeviceControl::FontLibrary\_FontCfgGetL ( in FontCfgID\_List\_t *FontCfgID\_List*, out FontCfgList\_t *FontCfgList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get information about fonts in the font library.

**Parameters**

|     |                       |                                                                                                       |
|-----|-----------------------|-------------------------------------------------------------------------------------------------------|
| in  | <i>FontCfgID_List</i> | List of font ID's to get information about. If empty, the function returns information for all fonts. |
| out | <i>FontCfgList</i>    | A list of font configuration data                                                                     |

**Version**

Release 8.2

**8.22.4.11** void DCM::DeviceControl::FontLibrary\_FontCfgSetL ( in FontCfgList\_t *FontCfgList* )  
 raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Update certain Fonts in the Font library.

**Parameters**

|    |                    |                                   |
|----|--------------------|-----------------------------------|
| in | <i>FontCfgList</i> | A list of Font configuration data |
|----|--------------------|-----------------------------------|

**Exceptions**

|                       |                                                                                                                                                                                                                                               |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | in case: <ul style="list-style-type: none"> <li>• one of the Font ID's is not valid.</li> <li>• one of elements in the list is not valid, e.g. if one of the elements. defines a Font name which another Font already has as name.</li> </ul> |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Version**

Release 8.2

**8.22.4.12** void DCM::DeviceControl::LogoLibrary\_Add ( in LogoCfg\_t *LogoCfg*, in string *FileFormat*, in ByteStream *Logo* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Add a logo to the logo library.

**Parameters**

|    |                   |                                                                                                          |
|----|-------------------|----------------------------------------------------------------------------------------------------------|
| in | <i>LogoCfg</i>    | Configuration data of the logo.                                                                          |
| in | <i>FileFormat</i> | Indicates how the logo data is encoded. This must be "png" for still logos and "mng" for animated logos. |
| in | <i>Logo</i>       | The logo data. This must be a png of mng file. For remote logos this should be empty.                    |

**Exceptions**

|                       |                                                                                                                                                                                                                                 |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | in case: <ul style="list-style-type: none"> <li>• the logo is not a valid logo.</li> <li>• no more entries are available (maximum 128 logos).</li> <li>• a logo of the same name already exists in the logo library.</li> </ul> |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Version**

Release 8.1

**8.22.4.13** void DCM::DeviceControl::LogoLibrary\_ExportLogo ( in LogoCfgID\_t *LogoCfgID*, in string *FileFormat*, out ByteStream *Logo* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Export (=download) a logo from the logo library.

#### Parameters

|     |                   |                                                                                                                                           |
|-----|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| in  | <i>LogoCfgID</i>  | ID of the requested logo.                                                                                                                 |
| in  | <i>FileFormat</i> | Indicates how the logo data must be encoded. This must be "png" if a still image is expected. And a "mng" if a animated logo is expected. |
| out | <i>Logo</i>       | The logo data. This is a png or mng file.                                                                                                 |

#### Exceptions

|                       |                                                                                      |
|-----------------------|--------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | in case: <ul style="list-style-type: none"> <li>the logo ID is not valid.</li> </ul> |
|-----------------------|--------------------------------------------------------------------------------------|

#### Version

Release 8.1

**8.22.4.14** void DCM::DeviceControl::LogoLibrary\_GetMaxLogoSize ( out MaximumLogoSize\_t *MaxLogoSize* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the device-wide maximum logo size.

Get the maximum accepted size for logos added in the future. Already uploaded logo's can be larger! All remote logos will always follow these maxima.

#### Parameters

|     |                    |                        |
|-----|--------------------|------------------------|
| out | <i>MaxLogoSize</i> | The maximum logo size. |
|-----|--------------------|------------------------|

#### Version

Release 8.2

**8.22.4.15** void DCM::DeviceControl::LogoLibrary\_LogoCfgDeleteL ( in LogoCfgID\_List\_t *LogoCfgID\_List* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Remove one or more logos from the logo library.

#### Parameters

|    |                       |                             |
|----|-----------------------|-----------------------------|
| in | <i>LogoCfgID_List</i> | ID's of the logos to remove |
|----|-----------------------|-----------------------------|

**Exceptions**

|                       |                                                                                                                                                       |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | in case of: <ul style="list-style-type: none"> <li>• one of the logo ID's is invalid.</li> <li>• one of the logo configurations is in use.</li> </ul> |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|

**Version**

Release 8.1

**8.22.4.16** void DCM::DeviceControl::LogoLibrary\_LogoCfgFileNrGetL ( in LogoCfgID\_List\_t *LogoCfgID\_List*, out LogoCfgFileNumberList\_t *LogoCfgFileNumbers* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the mapping between LogoCfgID and LogoFileNumber.

**Parameters**

|     |                           |                                                                                                       |
|-----|---------------------------|-------------------------------------------------------------------------------------------------------|
| in  | <i>LogoCfgID_List</i>     | List of logo ID's to get information about. If empty, the function returns information for all logos. |
| out | <i>LogoCfgFileNumbers</i> | The mapping between the logo config numbers and the logo file numbers.                                |

**Exceptions**

**Version**

Release 8.1

**8.22.4.17** void DCM::DeviceControl::LogoLibrary\_LogoCfgFileNrSetL ( in LogoCfgFileNumberList\_t *LogoCfgFileNumbers* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the mapping between LogoCfgID and LogoFileNumber.

The LogoFileNumber must be part of [1, 16]. A mapping can be removed by setting the LogoFileNumber to 0.

**Parameters**

|    |                           |                                                                        |
|----|---------------------------|------------------------------------------------------------------------|

**Version**

Release 8.1

**8.22.4.18** void DCM::DeviceControl::LogoLibrary\_LogoCfgGetL ( in LogoCfgID\_List\_t *LogoCfgID\_List*, out LogoCfgList\_t *LogoCfgList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get information about logos in the logo library.

**Parameters**

|     |                       |                                                                                                       |
|-----|-----------------------|-------------------------------------------------------------------------------------------------------|
| in  | <i>LogoCfgID_List</i> | List of logo ID's to get information about. If empty, the function returns information for all logos. |
| out | <i>LogoCfgList</i>    | A list of logo configuration data                                                                     |

**Version**

Release 8.1

**8.22.4.19** void DCM::DeviceControl::LogoLibrary\_LogoCfgSetL ( in LogoCfgList\_t *LogoCfgList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Update about certain logos in the logo library.

The 'AnimatedLogo' flag can't be updated.

**Parameters**

|    |                    |                                   |

| <i>OpNotSucceeded</i> | in case: <ul style="list-style-type: none"> <li>one of the logo ID's is not valid.</li> <li>one of elements in the list is not valid, e.g. if one of the elements. defines a logo name which another logo already has as name.</li> </ul> |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Version**

Release 8.1

**8.22.4.20** void DCM::DeviceControl::LogoLibrary\_SetMaxLogoSize ( in MaximumLogoSize\_t *MaxLogoSize* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set device-wide maximum logo size.

The maximum accepted size for logos added in the future will be set. Already uploaded logo's can be larger! All remote logos will always follow these maxima.

**Parameters**

|    |                    |                        |
|----|--------------------|------------------------|
| in | <i>MaxLogoSize</i> | The maximum logo size. |
|----|--------------------|------------------------|

**Version**

Release 8.2

**8.22.4.21** void DCM::DeviceControl::StartEAS ( in string *SAME*, in string *AlertText*, in unsigned long *BannerTimeout* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Start an EAS message.

This will insert a banner into all services (on logo insertion boards) which have their enEAS\_Control field set to Enabled.

**Parameters**

|    |                      |                                                                                                                                                         |
|----|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>SAME</i>          | The SAME code of the alert                                                                                                                              |
| in | <i>AlertText</i>     | The text to show encoded in ASCII For an empty text (no characters), the banner text will be used as defined in the corresponding banner configuration. |
| in | <i>BannerTimeout</i> | The maximum duration of the banner (in seconds) (0 for no timeout)                                                                                      |

**Version**

Release 8.2

**8.22.4.22** void DCM::DeviceControl::StartEAS\_V2 ( in string *SAME*, in string *AlertText*, in unsigned long *BannerTimeout*, in enBannerTextEncoding\_t *AlertTextEncoding* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Start an EAS message.

This will insert a banner into all services (on logo insertion boards) which have their enEAS\_Control field set to Enabled.

**Parameters**

|    |                           |                                                                                                                                         |
|----|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>SAME</i>               | The SAME code of the alert                                                                                                              |
| in | <i>AlertText</i>          | The text to show. For an empty text (no characters), the banner text will be used as defined in the corresponding banner configuration. |
| in | <i>BannerTimeout</i>      | The maximum duration of the banner (in seconds) (0 for no timeout)                                                                      |
| in | <i>AlertText-Encoding</i> | The encoding of the AlertText                                                                                                           |

**Version**

Release 8.7

**8.22.4.23** void DCM::DeviceControl::StartEAS\_V3 ( in string *SAME*, in string *AlertText*, in unsigned long *BannerTimeout*, in enBannerTextEncoding\_t *AlertTextEncoding*, in unsigned short *TextLoopCount* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Start an EAS message.

This will insert a banner into all services (on logo insertion boards) which have their enEAS\_Control field set to Enabled.

**Parameters**

|    |                           |                                                                                                                                                                                                                                                     |
|----|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>SAME</i>               | The SAME code of the alert                                                                                                                                                                                                                          |
| in | <i>AlertText</i>          | The text to show. For an empty text (no characters), the banner text will be used as defined in the corresponding banner configuration.                                                                                                             |
| in | <i>BannerTimeout</i>      | The maximum duration of the banner (in seconds) (0 for no timeout)                                                                                                                                                                                  |
| in | <i>AlertText-Encoding</i> | The encoding of the AlertText                                                                                                                                                                                                                       |
| in | <i>TextLoopCount</i>      | Number of times an banner should be displayed loop count of 0 means banner is played continously, loop count of 3 means banner is played three times loop count of 0xFFFE means the TextLoopCount of the corresponding banner configuration is used |

**Version**

Release 8.9

**8.22.4.24** void DCM::DeviceControl::StopBanners ( ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Stop all banners on all services This will stop any active banner (and EAS) on any logo insertion board.

**Version**

Release 8.2

**8.22.4.25** void DCM::DeviceControl::TC\_BannerSettingsGetL ( in unsigned short *BoardNr*, in IPS\_Service\_List\_t *ServiceList*, out TC\_BannerSettingsList\_t *BannerSettingsList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the banner configuration.

**Parameters**

|     |                            |                                                  |
|-----|----------------------------|--------------------------------------------------|
| in  | <i>BoardNr</i>             | The board number                                 |
| in  | <i>ServiceList</i>         | The list of service to retrieve the settigns for |
| out | <i>Banner-SettingsList</i> | The banner configurations                        |

**Exceptions**

|                       |                                                                                                                                                |

**Version**

Release 8.2

**8.22.4.28** void DCM::DeviceControl::TC\_GetBoardMode ( in unsigned short *BoardNr*, out enTC\_BoardMode\_t *enBoardMode* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the processor board mode.

**Parameters**

|     |                    |                            |
|-----|--------------------|----------------------------|
| in  | <i>BoardNr</i>     | The processor board number |
| out | <i>enBoardMode</i> | Requested board mode       |

**Exceptions**

|                       |                                                                |
|-----------------------|----------------------------------------------------------------|
| <i>OpNotSupported</i> | When BoardNr = 0 = Main or the board is not a processor board. |
|-----------------------|----------------------------------------------------------------|

**Version**

Release 8.1

**8.22.4.29** unsigned short DCM::DeviceControl::TC\_GetDSP\_Number ( in unsigned short *SlotNbr*, in IPS\_RefPid\_t *RefPid* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the DSP currently processing a certain PID.

Not supported if the board is in eTC\_BoardMode\_LogoInsertion mode.

**Parameters**

|    |                |                                           |
|----|----------------|-------------------------------------------|
| in | <i>SlotNbr</i> | transcoder board to set in loop back mode |
| in | <i>RefPid</i>  | The PID for which to find the DSP         |

**Exceptions**

|                       |                                        |
|-----------------------|----------------------------------------|
| <i>OpNotSupported</i> | when called for non-transcoder boards. |
| <i>OpNotSucceeded</i> | if the PID is not being transcoded     |

**Version**

Release 7.1

**8.22.4.30** void DCM::DeviceControl::TC\_LogoAddL ( in unsigned short *BoardNr*, in TC\_ServiceLogoCfgID\_List\_t *LogoToAdd* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

Add one or more logo configurations to one or more services.

The ServiceLogoID must be set to 0.

**Parameters**

|    |                  |                            |
|----|------------------|----------------------------|
| in | <i>BoardNr</i>   | The processor board number |
| in | <i>LogoToAdd</i> | Logo configurations to add |

**Exceptions**

|                       |                                                                                                                                                         |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When BoardNr = 0 = Main or the board is not a transcoder board.                                                                                         |
| <i>OpNotSucceeded</i> | in case: <ul style="list-style-type: none"> <li>invalid input references are used (RefSvc, LogoCfgID)</li> <li>no more entries are available</li> </ul> |

**Version**

Release 8.1

**8.22.4.31** void DCM::DeviceControl::TC\_LogoCfgSetL ( in unsigned short *BoardNr*, in TC\_LogoCfgList\_t *LogoCfgList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Update the logo settings on the logo processing board.

**Note**

: The settings done through this call are not persistent.

**Parameters**

|    |                    |                                 |
|----|--------------------|---------------------------------|
| in | <i>BoardNr</i>     | The processor board number      |
| in | <i>LogoCfgList</i> | The updated logo configurations |

**Exceptions**

|                       |                                                                              |
|-----------------------|------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When BoardNr = 0 = Main or the board is not a processing board.              |
| <i>OpNotSucceeded</i> | If the service doesn't exist or doesn't have a logo with that ID configured. |

**Version**

Release 8.1

**8.22.4.32** void DCM::DeviceControl::TC\_LogoDeleteL ( in unsigned short *BoardNr*, in TC\_ServiceLogoCfgID\_List\_t *LogosToDelete* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Remove one or more logo configurations from one or more services.

If the logo is currently displayed it will be removed immediately.

**Parameters**

|    |                      |                                       |
|----|----------------------|---------------------------------------|
| in | <i>BoardNr</i>       | The processor board number            |
| in | <i>LogosToDelete</i> | List of logo configurations to delete |

**Exceptions**

|                       |                                                                                                                  |
|-----------------------|------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When BoardNr = 0 = Main or the board is not a transcoder board.                                                  |
| <i>OpNotSucceeded</i> | in case: <ul style="list-style-type: none"> <li>invalid input references are used (RefSvc, LogoCfgID)</li> </ul> |

**Version**

Release 8.1

**8.22.4.33** void DCM::DeviceControl::TC\_LogoDisplayL ( in unsigned short *BoardNr*, in TC\_ServiceLogoDisplayList\_t *LogoDisplayList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Update the display status of logos.

These settings are not persistent.

**Parameters**

|    |                         |                                |
|----|-------------------------|--------------------------------|
| in | <i>BoardNr</i>          | The processor board number     |
| in | <i>LogoDisplay-List</i> | The new logo display settings. |

**Exceptions**

|                       |                                                                                                                                                             |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When BoardNr = 0 = Main or the board is not a transcoder board.                                                                                             |
| <i>OpNotSucceeded</i> | in case: <ul style="list-style-type: none"> <li>invalid input references are used (RefSvc, LogoCfgID)</li> <li>Too many logos would be displayed</li> </ul> |

**Version**

Release 8.1

**8.22.4.34** void DCM::DeviceControl::TC\_LogoGetL ( in unsigned short *BoardNr*, in IPS\_Service\_List\_t *ServiceList*, out TC\_LogoList\_t *LogoList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get logo transcoding settings.

**Parameters**

|     |                    |                                     |
|-----|--------------------|-------------------------------------|
| in  | <i>BoardNr</i>     | The processor board number          |
| in  | <i>ServiceList</i> | The list of services of interest    |
| out | <i>LogoList</i>    | Requested logo transcoding settings |

**Exceptions**

|                       |                                                                 |
|-----------------------|-----------------------------------------------------------------|
| <i>OpNotSupported</i> | When BoardNr = 0 = Main or the board is not a transcoder board. |
|-----------------------|-----------------------------------------------------------------|

|                       |                                                                                                       |
|-----------------------|-------------------------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | in case: <ul style="list-style-type: none"> <li>invalid input references are used (RefSvc)</li> </ul> |
|-----------------------|-------------------------------------------------------------------------------------------------------|

**Version**

Release 8.1

**8.22.4.35** void DCM::DeviceControl::TC\_LogoKeyerGetL ( in unsigned short *BoardNr*, in IPS\_Service\_List\_t *SvcList*, out TC\_LogoKeyerID\_List\_t *LogoKeyerIDs* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the current logo ID to keyer ID mapping.

**Parameters**

|    |                     |                                   |
|----|---------------------|-----------------------------------|
| in | <i>BoardNr</i>      | The processor board number        |
| in | <i>SvcList</i>      | The list of services of interest  |
| in | <i>LogoKeyerIDs</i> | The logo ID to keyer ID mappings. |

**Exceptions**

|                       |                                                                                                       |
|-----------------------|-------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When BoardNr = 0 = Main or the board is not a transcoder board.                                       |
| <i>OpNotSucceeded</i> | in case: <ul style="list-style-type: none"> <li>invalid input references are used (RefSvc)</li> </ul> |

**Version**

Release 8.1

**8.22.4.36** void DCM::DeviceControl::TC\_LogoKeyerUpdateL ( in unsigned short *BoardNr*, in TC\_LogoKeyerID\_List\_t *LogoKeyerIDs* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Update the LogoID <-> Keyer ID mapping .

A keyer ID of 0 means no keyer is assigned. Any other keyer ID ([1-8]) can only be assigned to one logo (per services). An assigned keyer ID can be removed by setting it to 0.

**Parameters**

|    |                     |                                   |
|----|---------------------|-----------------------------------|
| in | <i>BoardNr</i>      | The processor board number        |
| in | <i>LogoKeyerIDs</i> | The logo ID to keyer ID mappings. |

**Exceptions**

|                       |                                                                                                                                                                                                    |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When BoardNr = 0 = Main or the board is not a transcoder board.                                                                                                                                    |
| <i>OpNotSucceeded</i> | in case: <ul style="list-style-type: none"> <li>• Invalid references are used (RefSvc, LogoID)</li> <li>• One keyer ID is assigned to multiple logos</li> <li>• The keyer ID is invalid</li> </ul> |

**Version**

Release 8.1

**8.22.4.37** void DCM::DeviceControl::TC\_SetBoardMode ( in unsigned short *BoardNr*, in enTC\_BoardMode\_t *enBoardMode* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the processor board mode.

**Parameters**

|    |                    |                            |
|----|--------------------|----------------------------|
| in | <i>BoardNr</i>     | The processor board number |
| in | <i>enBoardMode</i> | Board mode to set          |

**Exceptions**

|                       |                                                                                                                                  |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When BoardNr = 0 = Main or the board is not a processor board.                                                                   |
| <i>OpNotSucceeded</i> | if the new board mode is different from the current board mode and there are currently transcodes or logo insertions configured. |

**Version**

Release 8.1

**8.22.4.38** void DCM::DeviceControl::TC\_StartBanner ( in unsigned short *BoardNr*, in IPS\_Service\_List\_t *ServiceList*, in TC\_Banner\_t *Banner* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

Start a banner.

**Parameters**

|    |                    |                                                                                  |
|----|--------------------|----------------------------------------------------------------------------------|
| in | <i>BoardNr</i>     | The board number                                                                 |
| in | <i>ServiceList</i> | The list of services to insert the banner into, an empty list means all services |
| in | <i>Banner</i>      | The banner to insert                                                             |

**Exceptions**

|                       |                                                                                                                                                |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | in case: <ul style="list-style-type: none"> <li>• The board is not a transcoder board</li> <li>• One of the services does not exist</li> </ul> |
| <i>LicenseError</i>   | in case: <ul style="list-style-type: none"> <li>• The service is not configured to accept banners</li> </ul>                                   |

**Version**

Release 8.2

**8.22.4.39** void DCM::DeviceControl::TC\_StartBanner\_V2 ( in unsigned short *BoardNr*, in IPS\_Service\_List\_t *ServiceList*, in TC\_Banner\_V2\_t *Banner* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

Start a banner.

**Parameters**

|    |                    |                                                                                  |
|----|--------------------|----------------------------------------------------------------------------------|
| in | <i>BoardNr</i>     | The board number                                                                 |
| in | <i>ServiceList</i> | The list of services to insert the banner into, an empty list means all services |
| in | <i>Banner</i>      | The banner to insert                                                             |

**Exceptions**

|                       |                                                                                                                                                |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | in case: <ul style="list-style-type: none"> <li>• The board is not a transcoder board</li> <li>• One of the services does not exist</li> </ul> |
| <i>LicenseError</i>   | in case: <ul style="list-style-type: none"> <li>• The service is not configured to accept banners</li> </ul>                                   |

**Version**

Release 8.7

**8.22.4.40** void DCM::DeviceControl::TC\_StopBanner ( in unsigned short *BoardNr*, in IPS\_Service\_List\_t *ServiceList* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Stop any banner in the service This will stop any active banner (and EAS) in all of the listed services.

**Parameters**

|    |                    |                                                                                   |
|----|--------------------|-----------------------------------------------------------------------------------|
| in | <i>BoardNr</i>     | The board number                                                                  |
| in | <i>ServiceList</i> | The services where the banners must be stopped. An empty list means all services. |

**Exceptions**

|                       |                                                                                                                                             |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | in case: <ul style="list-style-type: none"><li>• The board is not a transcoder board</li><li>• One of the services does not exist</li></ul> |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------|

**Version**

Release 8.2

## 8.23 Transrater Resource Counting

This contains specific types, enums and methods for controlling the Transrater Resource Counting part of the device.

### Classes

- struct [DCM::DeviceControl::TR\\_ResourceCountingSettings\\_t](#)  
*Settings needed to calculate different loads on TR board which can be modified by user.*
- struct [DCM::DeviceControl::TR\\_ResourceCountingLoads\\_t](#)  
*Calculated loads on TR board available for user.*

### Enumerations

- enum [DCM::DeviceControl::enTR\\_VideoFormat](#) { [DCM::DeviceControl::eTR\\_NTSC](#), [DCM::DeviceControl::eTR\\_PAL](#), [DCM::DeviceControl::eTR\\_VideoFormat\\_Reserved1](#), [DCM::DeviceControl::eTR\\_VideoFormat\\_Reserved2](#), [DCM::DeviceControl::eTR\\_VideoFormat\\_Reserved3](#), [DCM::DeviceControl::eTR\\_VideoFormat\\_Reserved4](#), [DCM::DeviceControl::eTR\\_VideoFormat\\_Reserved5](#), [DCM::DeviceControl::eTR\\_VideoFormat\\_Reserved6](#) }
- Video format needed to calculate different loads on TR board.*

### Functions

- void [DCM::DeviceControl::TR\\_SetGuaranteedSplicesEnabled](#) (in unsigned short BoardNr, in boolean bEnabled) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Enable/disable denying of splice\_request based on available resources.*
- void [DCM::DeviceControl::TR\\_GetGuaranteedSplicesEnabled](#) (in unsigned short BoardNr, out boolean bEnabled) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Query whether denying of splice\_request based on available resources is enabled/disabled.*
- void [DCM::DeviceControl::TR\\_ResetMaximumReachedLoad](#) (in unsigned short BoardNr) raises (-TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Resets the maximum reached load on a TR board.*
- void [DCM::DeviceControl::TR\\_SetResourceCountingSettings](#) (in unsigned short BoardNr, in [TR\\_ResourceCountingSettings\\_t](#) TR\_ResourceCountingSettings) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Set settings needed to calculate different loads on TR board.*
- void [DCM::DeviceControl::TR\\_GetResourceCountingSettings](#) (in unsigned short BoardNr, out [TR\\_ResourceCountingSettings\\_t](#) TR\_ResourceCountingSettings) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get settings needed to calculate different loads on TR board.*
- void [DCM::DeviceControl::TR\\_GetResourceCountingLoads](#) (in unsigned short BoardNr, out [TR\\_ResourceCountingLoads\\_t](#) TR\_ResourceCountingLoads) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get calculated loads on TR board.*
- void [DCM::DeviceControl::TR\\_SetStopStreamingReducesLoad](#) (in unsigned short BoardNr, in boolean bStopStreamingReducesLoad) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Set flag to take/don't take load into account depending on streaming state of service.*

- void **DCM::DeviceControl::TR\_GetStopStreamingReducesLoad** (in unsigned short *BoardNr*, out boolean *bStopStreamingReducesLoad*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get flag to take/don't take load into account depending on streaming state of service.*

### 8.23.1 Detailed Description

This contains specific types, enums and methods for controlling the Transrater Resource Counting part of the device.

### 8.23.2 Enumeration Type Documentation

#### 8.23.2.1 enum DCM::DeviceControl::enTR\_VideoFormat

Video format needed to calculate different loads on TR board.

Enumerator:

*eTR\_NTSC*

*eTR\_PAL*

*eTR\_VideoFormat\_Reserved1*

*eTR\_VideoFormat\_Reserved2*

*eTR\_VideoFormat\_Reserved3*

*eTR\_VideoFormat\_Reserved4*

*eTR\_VideoFormat\_Reserved5*

*eTR\_VideoFormat\_Reserved6*

Definition at line 14713 of file DCM.idl.

### 8.23.3 Function Documentation

- 8.23.3.1 void **DCM::DeviceControl::TR\_GetGuaranteedSplicesEnabled** ( in unsigned short *BoardNr*, out boolean *bEnabled* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Query whether denying of splice\_request based on available resources is enabled/disabled.

Parameters

|     |                 |  |
|-----|-----------------|--|
| in  | <i>BoardNr</i>  |  |
| out | <i>bEnabled</i> |  |

Exceptions

|                       |                                                                     |
|-----------------------|---------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | In case of invalid BoardNr or when no transrater board is available |
|-----------------------|---------------------------------------------------------------------|

Version

Release 8.2

**8.23.3.2** void DCM::DeviceControl::TR\_GetResourceCountingLoads ( in unsigned short *BoardNr*, out TR\_ResourceCountingLoads\_t *TR\_ResourceCountingLoads* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get calculated loads on TR board.

#### Parameters

|     |                                  |  |
|-----|----------------------------------|--|
| in  | <i>BoardNr</i>                   |  |
| out | <i>TR_Resource-CountingLoads</i> |  |

#### Exceptions

|                       |                                                                     |
|-----------------------|---------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | In case of invalid BoardNr or when no transrater board is available |
|-----------------------|---------------------------------------------------------------------|

#### Version

Release 8.2

**8.23.3.3** void DCM::DeviceControl::TR\_GetResourceCountingSettings ( in unsigned short *BoardNr*, out TR\_ResourceCountingSettings\_t *TR\_ResourceCountingSettings* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get settings needed to calculate different loads on TR board.

#### Parameters

|     |                                      |  |
|-----|--------------------------------------|--|
| in  | <i>BoardNr</i>                       |  |
| out | <i>TR_Resource-Counting-Settings</i> |  |

#### Exceptions

|                       |                                                                     |
|-----------------------|---------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | In case of invalid BoardNr or when no transrater board is available |
|-----------------------|---------------------------------------------------------------------|

#### Version

Release 8.2

**8.23.3.4** void DCM::DeviceControl::TR\_GetStopStreamingReducesLoad ( in unsigned short *BoardNr*, out boolean *bStopStreamingReducesLoad* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get flag to take/don't take load into account depending on streaming state of service.

#### Parameters

|     |                                    |  |
|-----|------------------------------------|--|
| in  | <i>BoardNr</i>                     |  |
| out | <i>bStop-Streaming-ReducesLoad</i> |  |

**Exceptions**

|                       |                                                                     |
|-----------------------|---------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | In case of invalid BoardNr or when no transrater board is available |
|-----------------------|---------------------------------------------------------------------|

**Version**

Release 8.5

**8.23.3.5** void DCM::DeviceControl::TR\_ResetMaximumReachedLoad ( in unsigned short *BoardNr* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Resets the maximum reached load on a TR board.

**Parameters**

|    |                |  |
|----|----------------|--|
| in | <i>BoardNr</i> |  |
|----|----------------|--|

**Exceptions**

|                       |                                                                     |
|-----------------------|---------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | In case of invalid BoardNr or when no transrater board is available |
|-----------------------|---------------------------------------------------------------------|

**Version**

Release 8.2

**8.23.3.6** void DCM::DeviceControl::TR\_SetGuaranteedSplicesEnabled ( in unsigned short *BoardNr*, in boolean *bEnabled* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Enable/disable denying of splice\_request based on available resources.

For splicing sufficient subgroup resources must be available in order to guarantee a successful splice. - When enabled, resource checking is done and if needed, the splice\_request is denied with a splice\_response containing RC 114 = Splice Queue Full.

**Parameters**

|    |                 |  |
|----|-----------------|--|
| in | <i>BoardNr</i>  |  |
| in | <i>bEnabled</i> |  |

**Exceptions**

|                       |                                                                     |
|-----------------------|---------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | In case of invalid BoardNr or when no transrater board is available |
|-----------------------|---------------------------------------------------------------------|

**Version**

Release 8.2

**8.23.3.7** void DCM::DeviceControl::TR\_SetResourceCountingSettings ( in unsigned short *BoardNr*, in TR\_ResourceCountingSettings\_t *TR\_ResourceCountingSettings* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set settings needed to calculate different loads on TR board.

**Parameters**

|    |                                      |  |
|----|--------------------------------------|--|
| in | <i>BoardNr</i>                       |  |
| in | <i>TR_Resource-Counting-Settings</i> |  |

**Exceptions**

|                       |                                                                     |
|-----------------------|---------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | In case of invalid BoardNr or when no transrater board is available |
|-----------------------|---------------------------------------------------------------------|

**Version**

Release 8.2

**8.23.3.8** void DCM::DeviceControl::TR\_SetStopStreamingReducesLoad ( in unsigned short *BoardNr*, in boolean *bStopStreamingReducesLoad* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set flag to take/don't take load into account depending on streaming state of service.

When set to true, the load of a transrated/spliceable service which is not streaming, is not taken into account.

**Parameters**

|    |                                    |  |
|----|------------------------------------|--|
| in | <i>BoardNr</i>                     |  |
| in | <i>bStop-Streaming-ReducesLoad</i> |  |

**Exceptions**

|                       |                                                                     |
|-----------------------|---------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | In case of invalid BoardNr or when no transrater board is available |
|-----------------------|---------------------------------------------------------------------|

**Version**

Release 8.5

## 8.24 Transrater

This contains specific types, enums and methods for controlling the transrater part of the device.

### Classes

- struct [DCM::DeviceControl::TR\\_GroupID\\_t](#)  
*Used for referencing transrater staging groups.*
- struct [DCM::DeviceControl::TR\\_DelayMode\\_t](#)
- struct [DCM::DeviceControl::TR\\_DelayMode\\_V2\\_t](#)
- struct [DCM::DeviceControl::TR\\_BitrateLimits\\_t](#)  
*Min - max bitrate boundaries used for service.*
- struct [DCM::DeviceControl::TR\\_GroupSettings\\_t](#)  
*Used to create and change transrater staging groups.*
- struct [DCM::DeviceControl::TR\\_TSSettings\\_t](#)  
*Represents an output transport stream in a transrater staging context.*
- struct [DCM::DeviceControl::TR\\_TSAdd\\_t](#)  
*Used to couple output transport stream(s) to a transrater group.*
- struct [DCM::DeviceControl::TR\\_Service\\_t](#)  
*Identifies an output service in a transrater staging context.*
- struct [DCM::DeviceControl::TR\\_ServiceSettings\\_t](#)  
*Transrater specific service settings.*
- struct [DCM::DeviceControl::TR\\_GroupServiceSettings\\_t](#)
- struct [DCM::DeviceControl::TR\\_ServiceSettings\\_V2\\_t](#)  
*Transrater specific service settings V2.*
- struct [DCM::DeviceControl::TR\\_GroupServiceSettings\\_V2\\_t](#)

### Typedefs

- typedef sequence< [TR\\_GroupID\\_t](#) > [DCM::DeviceControl::TR\\_GroupID\\_List\\_t](#)  
*A sequence of [TR\\_GroupID\\_t](#).*
- typedef sequence < [TR\\_GroupSettings\\_t](#) > [DCM::DeviceControl::TR\\_GroupSettings\\_List\\_t](#)  
*A sequence of [TR\\_GroupSettings\\_t](#).*
- typedef sequence< [TR\\_TSSettings\\_t](#) > [DCM::DeviceControl::TR\\_TSSettings\\_List\\_t](#)  
*A sequence of [TR\\_TSSettings\\_t](#).*
- typedef sequence< [TR\\_TSAdd\\_t](#) > [DCM::DeviceControl::TR\\_TSAdd\\_List\\_t](#)  
*A sequence of [TR\\_TSAdd\\_t](#).*
- typedef sequence < [TR\\_ServiceSettings\\_t](#) > [DCM::DeviceControl::TR\\_ServiceSettings\\_List\\_t](#)  
*A sequence of [TR\\_ServiceSettings\\_t](#).*
- typedef sequence < [TR\\_GroupServiceSettings\\_t](#) > [DCM::DeviceControl::TR\\_GroupServiceSettings\\_List\\_t](#)  
*A sequence of [TR\\_GroupServiceSettings\\_t](#).*
- typedef sequence < [TR\\_ServiceSettings\\_V2\\_t](#) > [DCM::DeviceControl::TR\\_ServiceSettings\\_V2\\_List\\_t](#)  
*A sequence of [TR\\_ServiceSettings\\_V2\\_t](#).*
- typedef sequence < [TR\\_GroupServiceSettings\\_V2\\_t](#) > [DCM::DeviceControl::TR\\_GroupServiceSettings\\_V2\\_List\\_t](#)  
*A sequence of [TR\\_GroupServiceSettings\\_V2\\_t](#).*

## Enumerations

- enum `DCM::DeviceControl::eTR_ServiceMode` { `DCM::DeviceControl::SrvM_PassThrough`, `DCM::DeviceControl::SrvM_StatMux`, `DCM::DeviceControl::SrvM_RateLimit` }
- enum `DCM::DeviceControl::eTR_BoardDelayMode` { `DCM::DeviceControl::DM_NormalDelay`, `DCM::DeviceControl::DM_LowDelay` }
- enum `DCM::DeviceControl::eTR_GroupType` { `DCM::DeviceControl::MultiTS`, `DCM::DeviceControl::SingleTS_TS`, `DCM::DeviceControl::SingleTS_Service` }
- enum `DCM::DeviceControl::enTR_Function_t` { `DCM::DeviceControl::eTR_Function_Normal`, `DCM::DeviceControl::eTR_Function_AVC_DPI`, `DCM::DeviceControl::eTR_Function_Reserved1`, `DCM::DeviceControl::eTR_Function_Reserved2`, `DCM::DeviceControl::eTR_Function_Reserved3` }
- enum `DCM::DeviceControl::eTR_Algorithm` { `DCM::DeviceControl::eTR_Performance`, `DCM::DeviceControl::eTR_Quality`, `DCM::DeviceControl::eTR_ExtendedGop` }
- enum `DCM::DeviceControl::eTR_Delay` { `DCM::DeviceControl::eTR_NormalDelay`, `DCM::DeviceControl::eTR_HighDelay` }
- enum `DCM::DeviceControl::eTR_CoarseDelay` { `DCM::DeviceControl::eTR_NormalCoarseDelay`, `DCM::DeviceControl::eTR_HighCoarseDelay`, `DCM::DeviceControl::eTR_PredefinedDelay`, `DCM::DeviceControl::eTR_CustomDelay`, `DCM::DeviceControl::eTR_LowDelay` }
- enum `DCM::DeviceControl::eTR_CoarseDelay_V2` { `DCM::DeviceControl::eTR_NormalCoarseDelay_V2`, `DCM::DeviceControl::eTR_HighCoarseDelay_V2`, `DCM::DeviceControl::eTR_PredefinedDelay_V2`, `DCM::DeviceControl::eTR_CustomDelay_V2`, `DCM::DeviceControl::eTR_LowDelay_V2`, `DCM::DeviceControl::eTR_TS_Delay_V2` }
- enum `DCM::DeviceControl::eTR_FrameRateDelay` { `DCM::DeviceControl::eTR_25Hz`, `DCM::DeviceControl::eTR_30Hz` }
- enum `DCM::DeviceControl::eTR_BoardTypeDelay` { `DCM::DeviceControl::eTR_ASI`, `DCM::DeviceControl::eTR_GbE` }
- enum `DCM::DeviceControl::eTR_FineDelay` { `DCM::DeviceControl::eTR_LowFineDelay`, `DCM::DeviceControl::eTR_NormalFineDelay`, `DCM::DeviceControl::eTR_HighFineDelay` }
- enum `DCM::DeviceControl::enTR_SpliceWindowAccuracy` { `DCM::DeviceControl::eTR_SpliceWindowAccuracy_BestEffort`, `DCM::DeviceControl::eTR_SpliceWindowAccuracy_Scte30`, `DCM::DeviceControl::eTR_SpliceWindowAccuracy_Reserved1`, `DCM::DeviceControl::eTR_SpliceWindowAccuracy_Reserved2`, `DCM::DeviceControl::eTR_SpliceWindowAccuracy_Reserved3`, `DCM::DeviceControl::eTR_SpliceWindowAccuracy_Reserved4`, `DCM::DeviceControl::eTR_SpliceWindowAccuracy_Reserved5` }
- enum `DCM::DeviceControl::eTRB_CC_UpdateMode` { `DCM::DeviceControl::eTRB_CC_UpdateMode_Off`, `DCM::DeviceControl::eTRB_CC_UpdateMode_Scte20_21`, `DCM::DeviceControl::eTRB_CC_UpdateMode_Reserved1`, `DCM::DeviceControl::eTRB_CC_UpdateMode_Reserved2`, `DCM::DeviceControl::eTRB_CC_UpdateMode_Reserved3`, `DCM::DeviceControl::eTRB_CC_UpdateMode_Reserved4`, `DCM::DeviceControl::eTRB_CC_UpdateMode_Reserved5`, `DCM::DeviceControl::eTRB_CC_UpdateMode_Reserved6`, `DCM::DeviceControl::eTRB_CC_UpdateMode_Reserved7`, `DCM::DeviceControl::eTRB_CC_UpdateMode_Reserved8` }

*Defines the closed caption update mode for SCTE20-SCTE21 conversion.*

## Functions

- void `DCM::DeviceControl::TR_SetBoardFunction` (in `IPS_Ref_t RefPhys`, in `enTR_Function_t enTR_Function`) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Set the transrater board function.*
- void `DCM::DeviceControl::TR_GetBoardFunction` (in `IPS_Ref_t RefPhys`, out `enTR_Function_t enTR_Function`) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get the transrater board function.*

- void [DCM::DeviceControl::TR\\_SetBoardAlgorithm](#) (in IPS\_Ref\_t RefPhys, in eTR\_Algorithm TR\_Algorithm) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Set the transrating algorithm.*
- void [DCM::DeviceControl::TR\\_GetBoardAlgorithm](#) (in IPS\_Ref\_t RefPhys, out eTR\_Algorithm TR\_Algorithm) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get the transrating algorithm.*
- void [DCM::DeviceControl::TR\\_SetBoardDelay](#) (in IPS\_Ref\_t RefPhys, in eTR\_Delay TR\_Delay) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Set the transrating board delay.*
- void [DCM::DeviceControl::TR\\_GetBoardDelay](#) (in IPS\_Ref\_t RefPhys, out eTR\_Delay TR\_Delay) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get the transrating board delay.*
- void [DCM::DeviceControl::TR\\_SetBoardDelayExtend](#) (in IPS\_Ref\_t RefPhys, in TR\_DelayMode\_t TR\_Delay) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Set the transrating board delay.*
- void [DCM::DeviceControl::TR\\_SetBoardDelayExtend\\_V2](#) (in IPS\_Ref\_t RefPhys, in TR\_DelayMode\_V2\_t TR\_Delay) raises (TimeOut, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)  
*Set the transrating board delay.*
- void [DCM::DeviceControl::TR\\_GetBoardDelayExtend](#) (in IPS\_Ref\_t RefPhys, out TR\_DelayMode\_t TR\_Delay) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get the transrating board delay.*
- void [DCM::DeviceControl::TR\\_GetBoardDelayExtend\\_V2](#) (in IPS\_Ref\_t RefPhys, out TR\_DelayMode\_V2\_t TR\_Delay) raises (TimeOut, OpNotAllowed, OpNotSupported)  
*Get the transrating board delay.*
- TR\_GroupID\_List\_t [DCM::DeviceControl::TR\\_GroupAddL](#) (in IPS\_Ref\_t RefPhys, in TR\_GroupSettings\_List\_t GroupList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Request to add a list of new transrater groups.*
- TR\_GroupSettings\_List\_t [DCM::DeviceControl::TR\\_GroupGetL](#) (in IPS\_Ref\_t RefPhys, in TR\_GroupID\_List\_t GroupIDList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Gets the list of transrater group IDs.*
- TR\_GroupID\_List\_t [DCM::DeviceControl::TR\\_GroupChangeL](#) (in IPS\_Ref\_t RefPhys, in TR\_GroupSettings\_List\_t GroupList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Change the settings of (multiple) transrater group(s).*
- TR\_GroupID\_List\_t [DCM::DeviceControl::TR\\_GroupDeleteL](#) (in IPS\_Ref\_t RefPhys, in TR\_GroupID\_List\_t GroupList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Delete transrater group(s).*
- TR\_TSAdd\_List\_t [DCM::DeviceControl::TR\\_TS\\_AddL](#) (in IPS\_Ref\_t RefPhys, in TR\_TSAdd\_List\_t GroupTSList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Add complete mux output transport stream(s) to transrater group(s).*
- TR\_TSAdd\_List\_t [DCM::DeviceControl::TR\\_TS\\_GetL](#) (in IPS\_Ref\_t RefPhys, in TR\_GroupID\_List\_t GroupIDList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Gets a list of TSs that are completely part of the transrater group(s).*
- TR\_TSAdd\_List\_t [DCM::DeviceControl::TR\\_TS\\_DeleteL](#) (in IPS\_Ref\_t RefPhys, in TR\_TSAdd\_List\_t GroupTSList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Delete TS(s) from transrater group(s).*
- TR\_GroupServiceSettings\_List\_t [DCM::DeviceControl::TR\\_ServiceAddL](#) (in IPS\_Ref\_t RefPhys, in TR\_GroupServiceSettings\_List\_t GroupServiceSettingsList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

*Add a sequence of service(s) to transrater group(s).*

- TR\_GroupServiceSettings\_List\_t [DCM::DeviceControl::TR\\_ServiceGetL](#) (in IPS\_Ref\_t RefPhys, in TR\_GroupID\_List\_t GroupIDList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Gets a sequence of service(s) that are added to transrater group(s).*

- TR\_GroupServiceSettings\_List\_t [DCM::DeviceControl::TR\\_ServiceChangeL](#) (in IPS\_Ref\_t RefPhys, in TR\_GroupServiceSettings\_List\_t GroupServiceSettingsList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

*Change a sequence of service setting(s) that were previously added to transrater group(s).*

- TR\_GroupServiceSettings\_List\_t [DCM::DeviceControl::TR\\_ServiceDeleteL](#) (in IPS\_Ref\_t RefPhys, in TR\_GroupServiceSettings\_List\_t GroupServiceSettingsList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Delete a sequence of service setting(s) that were previously added to transrater group(s).*

- TR\_BitRateMeasurementList\_t [DCM::DeviceControl::MM\\_GetTR\\_BitRate](#) (in IPS\_Ref\_t PhysRef, in TR\_GroupID\_List\_t GroupIDList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the bitrate information of transrater groups.*

- void [DCM::DeviceControl::TR\\_GetBoardPcrContinuity](#) (in IPS\_Ref\_t RefPhys, out boolean PcrContinuity) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the PCR continuity setting.*

- void [DCM::DeviceControl::TR\\_SetBoardPcrContinuity](#) (in IPS\_Ref\_t RefPhys, in boolean PcrContinuity) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Set the PCR continuity setting.*

- void [DCM::DeviceControl::TR\\_GetSpliceWindowAccuracy](#) (in IPS\_Ref\_t RefPhys, out enTR\_SpliceWindowAccuracy Accuracy) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the splice window accuracy setting.*

- void [DCM::DeviceControl::TR\\_SetSpliceWindowAccuracy](#) (in IPS\_Ref\_t RefPhys, in enTR\_SpliceWindowAccuracy Accuracy) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Set the splice window accuracy setting.*

- TR\_GroupServiceSettings\_V2\_List\_t [DCM::DeviceControl::TR\\_ServiceAddL\\_V2](#) (in IPS\_Ref\_t - RefPhys, in TR\_GroupServiceSettings\_V2\_List\_t GroupServiceSettingsList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

*Add a sequence of service(s) to transrater group(s).*

- TR\_GroupServiceSettings\_V2\_List\_t [DCM::DeviceControl::TR\\_ServiceGetL\\_V2](#) (in IPS\_Ref\_t - RefPhys, in TR\_GroupID\_List\_t GroupIDList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Gets a sequence of service(s) that are added to transrater group(s).*

- TR\_GroupServiceSettings\_V2\_List\_t [DCM::DeviceControl::TR\\_ServiceChangeL\\_V2](#) (in IPS\_Ref\_t RefPhys, in TR\_GroupServiceSettings\_V2\_List\_t GroupServiceSettingsList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

*Change a sequence of service setting(s) that were previously added to transrater group(s).*

- TR\_GroupServiceSettings\_V2\_List\_t [DCM::DeviceControl::TR\\_ServiceDeleteL\\_V2](#) (in IPS\_Ref\_t RefPhys, in TR\_GroupServiceSettings\_V2\_List\_t GroupServiceSettingsList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Delete a sequence of service setting(s) that were previously added to transrater group(s).*

- void [DCM::DeviceControl::TR\\_RestartBoard](#) (in unsigned short BoardNr) raises (TimeOut, OpNotSucceeded)

*The transrater board will be restarted.*

### 8.24.1 Detailed Description

This contains specific types, enums and methods for controlling the transrater part of the device.

### 8.24.2 Typedef Documentation

#### 8.24.2.1 typedef sequence<TR\_GroupID\_t> DCM::DeviceControl::TR\_GroupID\_List\_t

A sequence of [TR\\_GroupID\\_t](#).

Definition at line 14863 of file DCM.idl.

#### 8.24.2.2 typedef sequence<TR\_GroupServiceSettings\_t> DCM::DeviceControl::TR\_GroupServiceSettings\_List\_t

A sequence of [TR\\_GroupServiceSettings\\_t](#).

Definition at line 15029 of file DCM.idl.

#### 8.24.2.3 typedef sequence<TR\_GroupServiceSettings\_V2\_t> DCM::DeviceControl::TR\_GroupServiceSettings\_V2\_List\_t

A sequence of [TR\\_GroupServiceSettings\\_V2\\_t](#).

Definition at line 15477 of file DCM.idl.

#### 8.24.2.4 typedef sequence<TR\_GroupSettings\_t> DCM::DeviceControl::TR\_GroupSettings\_List\_t

A sequence of [TR\\_GroupSettings\\_t](#).

Definition at line 14985 of file DCM.idl.

#### 8.24.2.5 typedef sequence<TR\_ServiceSettings\_t> DCM::DeviceControl::TR\_ServiceSettings\_List\_t

A sequence of [TR\\_ServiceSettings\\_t](#).

Definition at line 15020 of file DCM.idl.

#### 8.24.2.6 typedef sequence<TR\_ServiceSettings\_V2\_t> DCM::DeviceControl::TR\_ServiceSettings\_V2\_List\_t

A sequence of [TR\\_ServiceSettings\\_V2\\_t](#).

Definition at line 15468 of file DCM.idl.

#### 8.24.2.7 typedef sequence<TR\_TSAdd\_t> DCM::DeviceControl::TR\_TSAdd\_List\_t

A sequence of [TR\\_TSAdd\\_t](#).

Definition at line 15001 of file DCM.idl.

#### 8.24.2.8 typedef sequence<TR\_TSSettings\_t> DCM::DeviceControl::TR\_TSSettings\_List\_t

A sequence of [TR\\_TSSettings\\_t](#).

Definition at line 14993 of file DCM.idl.

### 8.24.3 Enumeration Type Documentation

**8.24.3.1 enum DCM::DeviceControl::enTR\_Function\_t**

Enumerator:

- eTR\_Function\_Normal* Support MPEG-2 TR and DPI, Pid Sync, Slate insertion, ...
- eTR\_Function\_AVC\_DPI* Support AVC DPI.
- eTR\_Function\_Reserved1* not supported yet
- eTR\_Function\_Reserved2* not supported yet
- eTR\_Function\_Reserved3* not supported yet

Definition at line 14885 of file DCM.idl.

**8.24.3.2 enum DCM::DeviceControl::enTR\_SpliceWindowAccuracy**

Enumerator:

- eTR\_SpliceWindowAccuracy\_BestEffort*
- eTR\_SpliceWindowAccuracy\_Scte30*
- eTR\_SpliceWindowAccuracy\_Reserved1*
- eTR\_SpliceWindowAccuracy\_Reserved2*
- eTR\_SpliceWindowAccuracy\_Reserved3*
- eTR\_SpliceWindowAccuracy\_Reserved4*
- eTR\_SpliceWindowAccuracy\_Reserved5*

Definition at line 15397 of file DCM.idl.

**8.24.3.3 enum DCM::DeviceControl::eTR\_Algorithm**

Enumerator:

- eTR\_Performance* Use a faster algorithm but with lesser quality.
- eTR\_Quality* Use a slower algorithm but with better quality (less streams)
- eTR\_ExtendedGop* Specific quality algorithm for removing breathing effects in streams with long GOPs.

Definition at line 14894 of file DCM.idl.

**8.24.3.4 enum DCM::DeviceControl::eTR\_BoardDelayMode**

Enumerator:

- DM\_NormalDelay* Normal delay.
- DM\_LowDelay* Low delay (for future use).

Definition at line 14872 of file DCM.idl.

**8.24.3.5 enum DCM::DeviceControl::eTR\_BoardTypeDelay**

Enumerator:

- eTR\_ASI* Delay for an input stream on an ASI board.
- eTR\_GbE* Delay for an input stream on an GbE board.

Definition at line 14938 of file DCM.idl.

## 8.24.3.6 enum DCM::DeviceControl::eTR\_CoarseDelay

Enumerator:

- eTR\_NormalCoarseDelay* Normal delay of 1.4 seconds.
- eTR\_HighCoarseDelay* Higher delay of 1.8 seconds, results in more accurate splices.
- eTR\_PredefinedDelay* Predefined delay based on the frame rate, input board and finer delay setting of the streams, needed for statmux application (sync delay of MPEG2 & AVC encoders)
- eTR\_CustomDelay* Customized delay, the user can define the total delay of the transrater board together with a specific delay of the output buffer (without preanalysis)
- eTR\_LowDelay* Low delay configuration of the transrater board application (total delay of 440ms of which 140ms are used for preanalysis)

Definition at line 14910 of file DCM.idl.

## 8.24.3.7 enum DCM::DeviceControl::eTR\_CoarseDelay\_V2

Enumerator:

- eTR\_NormalCoarseDelay\_V2* Normal delay of 1.4 seconds.
- eTR\_HighCoarseDelay\_V2* Higher delay of 1.8 seconds, results in more accurate splices.
- eTR\_PredefinedDelay\_V2* Predefined delay based on the frame rate, input board and finer delay setting of the streams, needed for statmux application (sync delay of MPEG2 & AVC encoders)
- eTR\_CustomDelay\_V2* Customized delay, the user can define the total delay of the transrater board together with a specific delay of the output buffer (without preanalysis)
- eTR\_LowDelay\_V2* Low delay configuration of the transrater board application (total delay of 440ms of which 140ms are used for preanalysis).
- eTR\_TS\_Delay\_V2* TS delay mode in which the user can specify a custom delay but the co-processor cannot be used for anything else than pure delay.

Definition at line 14918 of file DCM.idl.

## 8.24.3.8 enum DCM::DeviceControl::eTR\_Delay

**Deprecated** This enum should not be used anymore since R5.01.

The enum is replaced by the structure [TR\\_DelayMode\\_t](#).

Enumerator:

- eTR\_NormalDelay* Normal delay of 1.4 seconds.
- eTR\_HighDelay* Higher delay of 1.8 seconds, results in more accurate splices.

Definition at line 14905 of file DCM.idl.

## 8.24.3.9 enum DCM::DeviceControl::eTR\_FineDelay

Enumerator:

- eTR\_LowFineDelay* Finer predefined delay setting: low delay.
- eTR\_NormalFineDelay* Finer predefined delay setting: normal delay.
- eTR\_HighFineDelay* Finer predefined delay setting: high delay.

Definition at line 14943 of file DCM.idl.

**8.24.3.10 enum DCM::DeviceControl::eTR\_FrameRateDelay****Enumerator:***eTR\_25Hz* Delay for a frame rate of 25 Hz.*eTR\_30Hz* Delay for a frame rate of 30 Hz.

Definition at line 14933 of file DCM.idl.

**8.24.3.11 enum DCM::DeviceControl::eTR\_GroupType****Enumerator:***MultiTS* A group that can contain multiple single program transport streams.*SingleTS\_TS* A group that can contain only one transport stream (no limit on the number of programs).*SingleTS\_Service* A group that can contain parts (programs) from multiple transport streams.

Definition at line 14878 of file DCM.idl.

**8.24.3.12 enum DCM::DeviceControl::eTR\_ServiceMode****Enumerator:***SrvM\_PassThrough* The service is only delayed, not transrated.*SrvM\_StatMux* The service is part of a statmux group and transrated according to the maximum rate of that group also, not only it's own min max bitrate.*SrvM\_RateLimit* The service is transrated only to it's own max bitrate (in fact minimum equals maximum bitrate in case of rate limit).

Definition at line 14865 of file DCM.idl.

**8.24.3.13 enum DCM::DeviceControl::eTRB\_CC\_UpdateMode**

Defines the closed caption update mode for SCTE20-SCTE21 conversion.

**Version**

Release 8.2

**Enumerator:***eTRB\_CC\_UpdateMode\_Off* (default) No update == behaviour pre-Release 8.2*eTRB\_CC\_UpdateMode\_Scte20\_21* Output always contains SCTE20 \*and\* SCTE21 user data (in that order).*eTRB\_CC\_UpdateMode\_Reserved1* reserved for future use.*eTRB\_CC\_UpdateMode\_Reserved2* reserved for future use.*eTRB\_CC\_UpdateMode\_Reserved3* reserved for future use.*eTRB\_CC\_UpdateMode\_Reserved4* reserved for future use.*eTRB\_CC\_UpdateMode\_Reserved5* reserved for future use.*eTRB\_CC\_UpdateMode\_Reserved6* reserved for future use.*eTRB\_CC\_UpdateMode\_Reserved7* reserved for future use.*eTRB\_CC\_UpdateMode\_Reserved8* reserved for future use.

Definition at line 15438 of file DCM.idl.

## 8.24.4 Function Documentation

**8.24.4.1** `TR_BitRateMeasurementList_t DCM::DeviceControl::MM_GetTR_BitRate ( in IPS_Ref_t PhysRef, in TR_GroupID_List_t GroupIDList )` raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the bitrate information of transrater groups.

## Parameters

|    |                    |                                                   |
|----|--------------------|---------------------------------------------------|
| in | <i>PhysRef</i>     | Specifies BoardNr, PortNr to get the bitrates of. |
| in | <i>GroupIDList</i> | Specifies to which the group the PIDs belong.     |

## Returns

TR\_BitRateMeasurementList\_t Requested output Transrater group bitrate information.

## Exceptions

|                       |                                                         |
|-----------------------|---------------------------------------------------------|
| <i>OpNotSupported</i> | When BoardNr = 0 = Main Board.                          |
| <i>OpNotSucceeded</i> | In case invalid references (PhysRef, GroupID) are used. |

## Note

This belongs to the bitrate group as well but TR\_GroupID\_List\_t is not defined there.

**8.24.4.2** `void DCM::DeviceControl::TR_GetBoardAlgorithm ( in IPS_Ref_t RefPhys, out eTR_Algorithm TR_Algorithm )` raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the transrating algorithm.

## Parameters

|     |                     |                                               |
|-----|---------------------|-----------------------------------------------|
| in  | <i>RefPhys</i>      | The slot(board) and port to apply the call on |
| out | <i>TR_Algorithm</i> | The current board algorithm                   |

## Exceptions

|                       |                                                     |
|-----------------------|-----------------------------------------------------|
| <i>OpNotSucceeded</i> | is thrown when no transraterboard is available      |
| <i>TimeOut</i>        | is thrown when it takes too long to handle the call |
| <i>OpNotAllowed</i>   | is thrown when no transraterboard is available      |

**8.24.4.3** `void DCM::DeviceControl::TR_GetBoardDelay ( in IPS_Ref_t RefPhys, out eTR_Delay TR_Delay )` raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the transrating board delay.

## Parameters

|     |                 |                                               |
|-----|-----------------|-----------------------------------------------|
| in  | <i>RefPhys</i>  | The slot(board) and port to apply the call on |
| out | <i>TR_Delay</i> |                                               |

**Exceptions**

|                       |                                                                                                                                           |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | is thrown when no transraterboard is available                                                                                            |
| <i>TimeOut</i>        | is thrown when it takes too long to handle the call                                                                                       |
| <i>OpNotAllowed</i>   | is thrown when no transraterboard is available                                                                                            |
| <i>OpNotSupported</i> | is thrown when the delay is set with the IDL call TR_SetBoardDelayExtend and Get with this IDL call (this call is deprecated since R5.01) |

**Deprecated** This call should not be used anymore since R5.01 (replaced by call TR\_GetBoardDelayExtend)

**8.24.4.4** void DCM::DeviceControl::TR\_GetBoardDelayExtend ( in IPS\_Ref\_t *RefPhys*, out TR\_DelayMode\_t *TR\_Delay* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the transrating board delay.

**Parameters**

|     |                 |                                               |
|-----|-----------------|-----------------------------------------------|
| in  | <i>RefPhys</i>  | The slot(board) and port to apply the call on |
| out | <i>TR_Delay</i> |                                               |

**Exceptions**

|                       |                                                     |
|-----------------------|-----------------------------------------------------|
| <i>OpNotSucceeded</i> | is thrown when no transraterboard is available      |
| <i>TimeOut</i>        | is thrown when it takes too long to handle the call |

**Deprecated** This call should not be used anymore since R08.09 (replaced by call TR\_SetBoardDelayExtend\_V2)

**8.24.4.5** void DCM::DeviceControl::TR\_GetBoardDelayExtend\_V2 ( in IPS\_Ref\_t *RefPhys*, out TR\_DelayMode\_V2\_t *TR\_Delay* ) raises (TimeOut, OpNotAllowed, OpNotSupported)

Get the transrating board delay.

**Parameters**

|     |                 |                                               |
|-----|-----------------|-----------------------------------------------|
| in  | <i>RefPhys</i>  | The slot(board) and port to apply the call on |
| out | <i>TR_Delay</i> |                                               |

**Exceptions**

|                |                                                     |
|----------------|-----------------------------------------------------|
| <i>TimeOut</i> | is thrown when it takes too long to handle the call |
|----------------|-----------------------------------------------------|

## Version

Release 8.9

**8.24.4.6** void DCM::DeviceControl::TR\_GetBoardFunction ( in IPS\_Ref\_t *RefPhys*, out enTR\_Function\_t *enTR\_Function* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the transrater board function.

## Parameters

|     |                      |                                               |
|-----|----------------------|-----------------------------------------------|
| in  | <i>RefPhys</i>       | The slot(board) and port to apply the call on |
| out | <i>enTR_Function</i> | The current transrater board function         |

## Exceptions

|                       |                                                     |
|-----------------------|-----------------------------------------------------|
| <i>OpNotSucceeded</i> | is thrown when no transraterboard is available      |
| <i>TimeOut</i>        | is thrown when it takes too long to handle the call |
| <i>OpNotAllowed</i>   | is thrown when no transraterboard is available      |

## Version

Release 8.0

**8.24.4.7** void DCM::DeviceControl::TR\_GetBoardPcrContinuity ( in IPS\_Ref\_t *RefPhys*, out boolean *PcrContinuity* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the PCR continuity setting.

## Parameters

|     |                      |                                               |
|-----|----------------------|-----------------------------------------------|
| in  | <i>RefPhys</i>       | The slot(board) and port to apply the call on |
| out | <i>PcrContinuity</i> |                                               |

## Exceptions

|                       |                                                     |
|-----------------------|-----------------------------------------------------|
| <i>OpNotSucceeded</i> | is thrown when no transraterboard is available      |
| <i>TimeOut</i>        | is thrown when it takes too long to handle the call |
| <i>OpNotSupported</i> | When BoardNr = 0 = Main Board                       |

**8.24.4.8** void DCM::DeviceControl::TR\_GetSpliceWindowAccuracy ( in IPS\_Ref\_t *RefPhys*, out enTR\_SpliceWindowAccuracy *Accuracy* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the splice window accuracy setting.

## Parameters

|     |                 |                                               |
|-----|-----------------|-----------------------------------------------|
| in  | <i>RefPhys</i>  | The slot(board) and port to apply the call on |
| out | <i>Accuracy</i> |                                               |

**Exceptions**

|                       |                                                     |
|-----------------------|-----------------------------------------------------|
| <i>OpNotSucceeded</i> | is thrown when no transrater board is available     |
| <i>TimeOut</i>        | is thrown when it takes too long to handle the call |
| <i>OpNotSupported</i> | When BoardNr = 0 = Main Board                       |

**Version**

Supported since Release 8.5

#### 8.24.4.9 TR\_GroupID\_List\_t DCM::DeviceControl::TR\_GroupAddL ( in IPS\_Ref\_t *RefPhys*, in TR\_GroupSettings\_List\_t *GroupList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Request to add a list of new transrater groups.

Group IDs are assigned and managed by the IO Board if zero is passed in. Group IDs can be assigned by the caller if non-zero is passed in. The ID should be in the range [2-501] and not yet taken by another group. The call can fail with an exception (see below). This does not mean that the whole call failed, correct groups are added and returned in the group ID list.

**Parameters**

|    |                  |                                                                          |
|----|------------------|--------------------------------------------------------------------------|
| in | <i>RefPhys</i>   | The slot(board) and port to apply the call on.                           |
| in | <i>GroupList</i> | A sequence of <a href="#">TR_GroupSettings_t</a> objects - ID is ignored |

**Returns**

TR\_GroupID\_List\_t A list of group IDs.

**Exceptions**

|                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | Is thrown when a general failure occurs. This can be the case when : <ul style="list-style-type: none"> <li>trying to add a MultiTS group to an ASI board, this is not allowed;</li> <li>trying to add a group with invalid bitrate setting, bitrate should be higher then 1Mbps and lower then 2Gbps;</li> <li>trying to add a group with an invalid group type;</li> <li>trying to add a group with a TS reference for an output TS that is already a complete part of a transrater group (this can be the only part of a SingleTS_TS group or one of many SPTS in a MultiTS group);</li> <li>trying to add a group with a malformed TS reference (only the port number is checked for validity);</li> <li>trying to add a SingleTS_TS or SingleTS_Service group with a bitrate lower than the output TS bitrate;</li> <li>trying to add a group if there are no more group IDs available;</li> <li>trying to add a group with an ID that has already been taken;</li> </ul> |
| <i>TimeOut</i>        | Is thrown when it takes too long to handle the call.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**8.24.4.10** `TR_GroupID_List_t DCM::DeviceControl::TR_GroupChangeL ( in IPS_Ref_t RefPhys, in TR_GroupSettings_List_t GroupList )` raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Change the settings of (multiple) transrater group(s).

#### Parameters

|    |                  |                                                                           |
|----|------------------|---------------------------------------------------------------------------|
| in | <i>RefPhys</i>   | The slot(board) and port to apply the call on.                            |
| in | <i>GroupList</i> | A sequence of <a href="#">TR_GroupSettings_t</a> objects - ID is ignored. |

#### Returns

`TR_GroupID_List_t` A list of group IDs.

#### Exceptions

|                       |                                                                                                                                                                                                        |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | Is thrown when a general failure occurs. This can be the case when trying to change the group type or the TS reference or if the group does not exist. It is thrown also if you pass in an empty list. |
| <i>Timeout</i>        | Is thrown when it takes too long to handle the call.                                                                                                                                                   |

**8.24.4.11** `TR_GroupID_List_t DCM::DeviceControl::TR_GroupDeleteL ( in IPS_Ref_t RefPhys, in TR_GroupID_List_t GroupList )` raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Delete transrater group(s).

Deleting a group means what it says : everything in the group is also removed, both from the settings and from the transrater board.

#### Parameters

|    |                  |                                                                 |
|----|------------------|-----------------------------------------------------------------|
| in | <i>RefPhys</i>   | The slot(board) and port to apply the call on.                  |
| in | <i>GroupList</i> | A sequence of group IDs for the groups that have to be deleted. |

#### Returns

`TR_GroupID_List_t` An (obviously obsolete) list of group IDs.

#### Exceptions

|                       |                                                                                                         |
|-----------------------|---------------------------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | Is thrown when a general failure occurs. This is the case if (one of the) group ID(s) do(es) not exist. |
| <i>Timeout</i>        | Is thrown when it takes too long to handle the call.                                                    |

**8.24.4.12** `TR_GroupSettings_List_t DCM::DeviceControl::TR_GroupGetL ( in IPS_Ref_t RefPhys, in TR_GroupID_List_t GroupIDList )` raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the list of transrater group IDs.

It is possible to get the whole list if an empty list is passed in.

**Parameters**

|    |                    |                                                                   |
|----|--------------------|-------------------------------------------------------------------|
| in | <i>RefPhys</i>     | The slot(board) and port to apply the call on.                    |
| in | <i>GroupIDList</i> | A TR_GroupID_List_t list of group IDs. This can be an empty list. |

**Returns**

The sequence of [TR\\_GroupSettings\\_t](#) objects for the requested list of groups.

**Exceptions**

|                       |                                                                                                    |
|-----------------------|----------------------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | Is thrown when a general failure occurs. This is currently only so if an invalid group ID is used. |
| <i>TimeOut</i>        | Is thrown when it takes too long to handle the call.                                               |

#### 8.24.4.13 void DCM::DeviceControl::TR\_RestartBoard ( in unsigned short *BoardNr* ) raises (TimeOut, OpNotSucceeded)

The transrater board will be restarted.

All services that are processed by the transrater, including spliced services, will be interrupted during the reset of the board.

**Parameters**

|    |                |                                 |
|----|----------------|---------------------------------|
| in | <i>BoardNr</i> | The board to apply the call on. |
|----|----------------|---------------------------------|

**Exceptions**

|                       |                                                                                                   |
|-----------------------|---------------------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | - When a general failure occurs.<br>• When there is no transrater board on the specified location |
| <i>TimeOut</i>        | Is thrown when it takes too long to handle the call.                                              |

**Version**

Release 10.10

#### 8.24.4.14 TR\_GroupServiceSettings\_List\_t DCM::DeviceControl::TR\_ServiceAddL ( in IPS\_Ref\_t *RefPhys*, in TR\_GroupServiceSettings\_List\_t *GroupServiceSettingsList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

Add a sequence of service(s) to transrater group(s).

This will only be allowed for selective services type of groups.

**Parameters**

|    |                                 |                                                                                                                                                                                                               |
|----|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>RefPhys</i>                  | The slot(board) and port to apply the call on.                                                                                                                                                                |
| in | <i>GroupServiceSettingsList</i> | The sequence of group ID(s) - service relations that should be added. - The settings also contain transrater specific settings like the minimum and maximum bitrate that should be applied on the service(s). |

**Returns**

The actual sequence of group ID(s) - service relations that were added.

**Exceptions**

The actual sequence of group ID(s) - service relations that were deleted and are now become obsolete.

**Exceptions**

|                       |                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | - When a general failure occurs. <ul style="list-style-type: none"> <li>• if group ID(s) and/or service ID(s) do(es) not exist,</li> <li>• if the transrater group is not of the correct type,</li> <li>• if a service is not part of the group or</li> <li>• if there are not enough licenses anymore. In case there are not enough licenses, the action is done anyway but the service will be set in passthrough mode.</li> </ul> |
| <i>TimeOut</i>        | Is thrown when it takes too long to handle the call.                                                                                                                                                                                                                                                                                                                                                                                 |

**Version**

Release 8.2

**8.24.4.20** `TR_GroupServiceSettings_List.t DCM::DeviceControl::TR_ServiceGetL ( in IPS_Ref_t RefPhys, in TR_GroupID_List_t GroupIDList ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)`

Gets a sequence of service(s) that are added to transrater group(s).

This will only be relevant for selective services type of groups.

**Parameters**

|    |                    |                                                                |
|----|--------------------|----------------------------------------------------------------|
| in | <i>RefPhys</i>     | The slot(board) and port to apply the call on.                 |
| in | <i>GroupIDList</i> | The sequence of transrater groups to request the services for. |

**Returns**

GroupServiceSettingsList The sequence of group ID(s) - service relations.

**Exceptions**

|                       |                                                                                       |
|-----------------------|---------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | Is thrown when a general failure occurs. Thrown also if group ID(s) do(es) not exist. |
| <i>TimeOut</i>        | Is thrown when it takes too long to handle the call.                                  |

**8.24.4.21** `TR_GroupServiceSettings_V2_List.t DCM::DeviceControl::TR_ServiceGetL_V2 ( in IPS_Ref_t RefPhys, in TR_GroupID_List_t GroupIDList ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)`

Gets a sequence of service(s) that are added to transrater group(s).

This will only be relevant for selective services type of groups.

**Parameters**

|    |                    |                                                                |
|----|--------------------|----------------------------------------------------------------|
| in | <i>RefPhys</i>     | The slot(board) and port to apply the call on.                 |
| in | <i>GroupIDList</i> | The sequence of transrater groups to request the services for. |

**Returns**

GroupServiceSettingsList The sequence of group ID(s) - service relations.

**Exceptions**

|                       |                                                                                       |
|-----------------------|---------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | Is thrown when a general failure occurs. Thrown also if group ID(s) do(es) not exist. |
| <i>TimeOut</i>        | Is thrown when it takes too long to handle the call.                                  |

**Version**

Release 8.2

**8.24.4.22** void DCM::DeviceControl::TR\_SetBoardAlgorithm ( in IPS\_Ref\_t *RefPhys*, in eTR\_Algorithm *TR\_Algorithm* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the transrating algorithm.

**Parameters**

|    |                     |                                               |
|----|---------------------|-----------------------------------------------|
| in | <i>RefPhys</i>      | The slot(board) and port to apply the call on |
| in | <i>TR_Algorithm</i> | The new board algorithm to apply              |

**Exceptions**

|                       |                                                                                                        |
|-----------------------|--------------------------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | is thrown when any of the supplied paramaters is out of range and when no transraterboard is available |
| <i>TimeOut</i>        | is thrown when it takes too long to handle the call                                                    |
| <i>OpNotAllowed</i>   | is thrown when no transraterboard is available                                                         |

**8.24.4.23** void DCM::DeviceControl::TR\_SetBoardDelay ( in IPS\_Ref\_t *RefPhys*, in eTR\_Delay *TR\_Delay* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the transrating board delay.

**Parameters**

|    |                 |                                               |
|----|-----------------|-----------------------------------------------|
| in | <i>RefPhys</i>  | The slot(board) and port to apply the call on |
| in | <i>TR_Delay</i> |                                               |

**Exceptions**

|                       |                                                                                                        |
|-----------------------|--------------------------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | is thrown when any of the supplied paramaters is out of range and when no transraterboard is available |
| <i>TimeOut</i>        | is thrown when it takes too long to handle the call                                                    |
| <i>OpNotAllowed</i>   | is thrown when no transraterboard is available                                                         |

**Deprecated** This call should not be used anymore since R5.01 (replaced by call TR\_SetBoardDelay-Extend)

**8.24.4.24** void DCM::DeviceControl::TR\_SetBoardDelayExtend ( in IPS\_Ref\_t *RefPhys*, in TR\_DelayMode\_t *TR\_Delay* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the transrating board delay.

#### Parameters

|    |                 |                                               |
|----|-----------------|-----------------------------------------------|
| in | <i>RefPhys</i>  | The slot(board) and port to apply the call on |
| in | <i>TR_Delay</i> |                                               |

#### Exceptions

|                       |                                                                                                        |
|-----------------------|--------------------------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | is thrown when any of the supplied paramaters is out of range and when no transraterboard is available |
| <i>TimeOut</i>        | is thrown when it takes too long to handle the call                                                    |

**Deprecated** This call should not be used anymore since R08.09 (replaced by call TR\_GetBoardDelay-Extend\_V2)

**8.24.4.25** void DCM::DeviceControl::TR\_SetBoardDelayExtend\_V2 ( in IPS\_Ref\_t *RefPhys*, in TR\_DelayMode\_V2\_t *TR\_Delay* ) raises (TimeOut, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)

Set the transrating board delay.

#### Parameters

|    |                 |                                               |
|----|-----------------|-----------------------------------------------|
| in | <i>RefPhys</i>  | The slot(board) and port to apply the call on |
| in | <i>TR_Delay</i> |                                               |

#### Exceptions

|                        |                                                                                                                                                                                                        |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OperationFailed</i> | is thrown <ul style="list-style-type: none"> <li>• when any of the supplied paramaters is out of range</li> <li>• when a feature of the co-processor board is configured on a service or TS</li> </ul> |
| <i>TimeOut</i>         | is thrown when it takes too long to handle the call                                                                                                                                                    |

#### Version

Release 8.9

**8.24.4.26** void DCM::DeviceControl::TR\_SetBoardFunction ( in IPS\_Ref\_t *RefPhys*, in enTR\_Function\_t *enTR\_Function* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the transrater board function.

The transrater board can switch between multiple functions:

- Normal: Supports transrating, DPI, PID Sync, Slate insertion,...

- AVC-DPI: Supports AVC splicing but nothing else.

**Parameters**

|    |                      |                                               |
|----|----------------------|-----------------------------------------------|
| in | <i>RefPhys</i>       | The slot(board) and port to apply the call on |
| in | <i>enTR_Function</i> | the board function                            |

**Exceptions**

|                       |                                                                                                        |
|-----------------------|--------------------------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | is thrown when any of the supplied paramaters is out of range and when no transraterboard is available |
| <i>TimeOut</i>        | is thrown when it takes too long to handle the call                                                    |
| <i>OpNotAllowed</i>   | is thrown when no transraterboard is available                                                         |

**Version**

Release 8.0

**8.24.4.27** void DCM::DeviceControl::TR\_SetBoardPcrContinuity ( in IPS\_Ref\_t *RefPhys*, in boolean *PcrContinuity* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the PCR continuity setting.

**Parameters**

|    |                      |                                               |
|----|----------------------|-----------------------------------------------|
| in | <i>RefPhys</i>       | The slot(board) and port to apply the call on |
| in | <i>PcrContinuity</i> |                                               |

**Exceptions**

|                       |                                                     |
|-----------------------|-----------------------------------------------------|
| <i>OpNotSucceeded</i> | is thrown when no transraterboard is available      |
| <i>TimeOut</i>        | is thrown when it takes too long to handle the call |
| <i>OpNotSupported</i> | When BoardNr = 0 = Main Board                       |

**8.24.4.28** void DCM::DeviceControl::TR\_SetSpliceWindowAccuracy ( in IPS\_Ref\_t *RefPhys*, in enTR\_SpliceWindowAccuracy *Accuracy* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the splice window accuracy setting.

**Parameters**

|    |                 |                                               |
|----|-----------------|-----------------------------------------------|
| in | <i>RefPhys</i>  | The slot(board) and port to apply the call on |
| in | <i>Accuracy</i> |                                               |

**Exceptions**

|                       |                                                     |
|-----------------------|-----------------------------------------------------|
| <i>OpNotSucceeded</i> | is thrown when no transrater board is available     |
| <i>TimeOut</i>        | is thrown when it takes too long to handle the call |
| <i>OpNotSupported</i> | When BoardNr = 0 = Main Board                       |

**Version**

Supported since Release 8.5

**8.24.4.29** `TR_TSAdd_List_t DCM::DeviceControl::TR_TS_AddL ( in IPS_Ref_t RefPhys, in TR_TSAdd_List_t GroupTSList )` raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Add complete mux output transport stream(s) to transrater group(s).

When a change occurs on the muxed output transport stream this is updated in the group automatically also because of the transport stream - transrater group relation. So there is NO NEED to add newly muxed output services explicitly to the transrater group (type single TS or multi TS) if that group already contains the transport stream. Transport streams as a whole or not put in transrater groups of type selective services. For those types of transrater groups the services should be added manually to a SingleTS\_Service group by calling the TS\_ServiceAddL call.

**Parameters**

|    |                    |                                                                                     |
|----|--------------------|-------------------------------------------------------------------------------------|
| in | <i>RefPhys</i>     | The slot(board) and port to apply the call on.                                      |
| in | <i>GroupTSList</i> | A sequence of tranrater group - transport stream(s) relations that should be added. |

**Returns**

The sequence of transrater group - transport stream(s) relations that were actually created.

**Exceptions**

|                       |                                          |
|-----------------------|------------------------------------------|
| <i>OpNotSucceeded</i> | Is thrown when a general failure occurs. |
|-----------------------|------------------------------------------|

This is the case :

- if group ID(s) and/or transport stream ID(s) do not exist;
- if the transport stream is already part of a group;
- if trying to add more than one TS to a SingleTS\_TS group;
- if trying to add a TS to a SingleTS\_Service group;
- if trying to add a MPTS to a MultiTS group;
- if not enough licenses are available (the TS will be added but some or all services will be put in passthrough);
- if there are not enough internal resources anymore to add the TS to a group;

**Exceptions**

|                |                                                      |
|----------------|------------------------------------------------------|
| <i>TimeOut</i> | Is thrown when it takes too long to handle the call. |
|----------------|------------------------------------------------------|

**8.24.4.30** `TR_TSAdd_List_t DCM::DeviceControl::TR_TS_DeleteL ( in IPS_Ref_t RefPhys, in TR_TSAdd_List_t GroupTSList )` raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Delete TS(s) from transrater group(s).

This means that every single pid from every TS specified is removed from the transrater group.

#### Parameters

|    |                    |                                                                                     |
|----|--------------------|-------------------------------------------------------------------------------------|
| in | <i>RefPhys</i>     | The slot(board) and port to apply the call on.                                      |
| in | <i>GroupTSList</i> | The sequence of group ID(s) - transport stream(s) relations that should be deleted. |

#### Returns

The sequence of (just becoming obsolete) group ID(s) = transport stream(s) relations.

#### Exceptions

|                       |                                                                                       |
|-----------------------|---------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | Is thrown when a general failure occurs. Thrown also if group ID(s) do(es) not exist. |
| <i>TimeOut</i>        | Is thrown when it takes too long to handle the call.                                  |

**8.24.4.31** `TR_TSAdd_List_t DCM::DeviceControl::TR_TS_GetL ( in IPS_Ref_t RefPhys, in TR_GroupID_List_t GroupIDList )` raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets a list of TSs that are completely part of the transrater group(s).

#### Parameters

|    |                    |                                                                    |
|----|--------------------|--------------------------------------------------------------------|
| in | <i>RefPhys</i>     | The slot(board) and port to apply the call on.                     |
| in | <i>GroupIDList</i> | The sequence of group IDs the transport streams are requested for. |

#### Returns

The sequence of transrater group - transport stream(s) relations. Only the valid groups are returned in the list.

#### Exceptions

|                       |                                                                                                                    |
|-----------------------|--------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | Is thrown when a general failure occurs. This is for the moment only the case if (a) group ID(s) do(es) not exist. |
| <i>TimeOut</i>        | Is thrown when it takes too long to handle the call.                                                               |

## 8.25 Re-alignment Mux Staging

This contains specific types, enums and methods for controlling the Re-alignment Mux Staging (performed on the co-processor board known as Transrater Board)

### Classes

- struct [DCM::DeviceControl::RMX\\_GroupSettings\\_t](#)  
*Realignment Mux group settings.*
- struct [DCM::DeviceControl::RMX\\_GroupSvc\\_t](#)  
*A service that is part of a Realignment Mux group.*
- struct [DCM::DeviceControl::RMX\\_GroupSvcs\\_t](#)  
*A set of services belonging to the same Realignment Mux group.*

### Typedefs

- typedef unsigned long [DCM::DeviceControl::RMX\\_GroupID\\_t](#)  
*Realignment Mux group ID.*
- typedef sequence< [RMX\\_GroupID\\_t](#) > [DCM::DeviceControl::RMX\\_GroupID\\_List\\_t](#)  
*A list of Realignment Mux group IDs.*
- typedef sequence< [RMX\\_GroupSettings\\_t](#) > [DCM::DeviceControl::RMX\\_GroupSettings\\_List\\_t](#)  
*A list of Realignment Mux group settings.*
- typedef sequence< [RMX\\_GroupSvc\\_t](#) > [DCM::DeviceControl::RMX\\_GroupSvc\\_List\\_t](#)
- typedef sequence< [RMX\\_GroupSvcs\\_t](#) > [DCM::DeviceControl::RMX\\_GroupSvcs\\_List\\_t](#)  
*A list where each node is a set of Realignment Mux services belonging to the same group.*

### Enumerations

- enum [DCM::DeviceControl::eRMX\\_GroupType\\_t](#) { [DCM::DeviceControl::eRMX\\_SingleTS\\_Selected-Svc](#), [DCM::DeviceControl::eRMX\\_GT\\_Reserved\\_1](#), [DCM::DeviceControl::eRMX\\_GT\\_Reserved\\_2](#), [DCM::DeviceControl::eRMX\\_GT\\_Reserved\\_3](#), [DCM::DeviceControl::eRMX\\_GT\\_Reserved\\_4](#), [DCM::DeviceControl::eRMX\\_GT\\_Reserved\\_5](#), [DCM::DeviceControl::eRMX\\_GT\\_Reserved\\_6](#), [DCM::DeviceControl::eRMX\\_GT\\_Reserved\\_7](#), [DCM::DeviceControl::eRMX\\_GT\\_Reserved\\_8](#) }  
*Realignment group type.*
- enum [DCM::DeviceControl::eRMX\\_ServiceStatus\\_t](#) { [DCM::DeviceControl::eRMX\\_SvcStatus\\_-Passed\\_Delayed](#), [DCM::DeviceControl::eRMX\\_SvcStatus\\_Blocked\\_NoMarkers](#), [DCM::DeviceControl::eRMX\\_SvcStatus\\_Blocked\\_NegativeDelay](#), [DCM::DeviceControl::eRMX\\_SvcStatus\\_NotPresent](#), [DCM::DeviceControl::eRMX\\_SvcStatus\\_Passed\\_Undelayed](#), [DCM::DeviceControl::eRMX\\_SvcStatus\\_Passed\\_Delayed\\_NoMarkers](#), [DCM::DeviceControl::eRMX\\_SvcStatus\\_Passed\\_Delayed\\_InvalidTime](#), [DCM::DeviceControl::eRMX\\_SvcStatus\\_Blocked\\_InvalidTime](#), [DCM::DeviceControl::eRMX\\_SvcStatus\\_Blocked\\_IncompatibleRealignmentInfo](#), [DCM::DeviceControl::eRMX\\_SvcStatus\\_Blocked\\_DejitterBufferReset](#), [DCM::DeviceControl::eRMX\\_SvcStatus\\_Blocked\\_DtsStcCompOut-OfLimits](#), [DCM::DeviceControl::eRMX\\_SvcStatus\\_Reserved1](#), [DCM::DeviceControl::eRMX\\_SvcStatus\\_Reserved2](#), [DCM::DeviceControl::eRMX\\_SvcStatus\\_Reserved3](#), [DCM::DeviceControl::eRMX\\_SvcStatus\\_Reserved4](#), [DCM::DeviceControl::eRMX\\_SvcStatus\\_Reserved5](#), [DCM::DeviceControl::eRMX\\_SvcStatus\\_Reserved6](#) }  
*Realignment Mux service status.*

## Functions

- void [DCM::DeviceControl::RMX\\_SetRealignmentBoardMode](#) (in unsigned short BoardNr, in boolean Enable) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)  
*Enable/disable Realignment Mode on a specific board.*
- void [DCM::DeviceControl::RMX\\_GetRealignmentBoardMode](#) (in unsigned short BoardNr, out boolean IsEnabled) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

*Query the Realignment Mode of a specific board.*

- void [DCM::DeviceControl::RMX\\_GroupCreate](#) (in unsigned short BoardNr, in RMX\_GroupSettings\_List\_t GroupSettingsList, out RMX\_GroupID\_List\_t CreatedGroupIDs) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

*Create a set of Realignment Mux groups.*

- void [DCM::DeviceControl::RMX\\_GroupGet](#) (in IPS\_RefTS\_t Location, in RMX\_GroupID\_List\_t - GroupIDList, out RMX\_GroupSettings\_List\_t GroupSettingsList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

*Get a list of Realignment Mux group settings.*

- void [DCM::DeviceControl::RMX\\_GroupChange](#) (in unsigned short BoardNr, in RMX\_GroupSettings\_List\_t GroupList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

*Change the settings of one or more Realignment Mux groups.*

- void [DCM::DeviceControl::RMX\\_GroupDelete](#) (in unsigned short BoardNr, in RMX\_GroupID\_List\_t GroupIDList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

*Delete one or more Realignment Mux groups.*

- void [DCM::DeviceControl::RMX\\_ServiceAdd](#) (in unsigned short BoardNr, in RMX\_GroupSvc\_List\_t GroupServicesList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

*Add services to a Realignment Mux group.*

- void [DCM::DeviceControl::RMX\\_ServiceGet](#) (in unsigned short BoardNr, in RMX\_GroupID\_List\_t GroupIDList, out RMX\_GroupSvc\_List\_t GroupServicesList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

*Get a list of services that were added explicitly.*

- void [DCM::DeviceControl::RMX\\_ServiceDelete](#) (in unsigned short BoardNr, in RMX\_GroupSvc\_List\_t GroupServicesList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

*Delete a subset of the services that were previously added explicitly to one or more Realignment Mux groups.*

### 8.25.1 Detailed Description

This contains specific types, enums and methods for controlling the Re-alignment Mux Staging (performed on the co-processor board known as Transrater Board)

### 8.25.2 Typedef Documentation

#### 8.25.2.1 typedef sequence<RMX\_GroupID\_t> DCM::DeviceControl::RMX\_GroupID\_List\_t

A list of Realignment Mux group IDs.

Definition at line 15609 of file DCM.idl.

**8.25.2.2 typedef unsigned long DCM::DeviceControl::RMX\_GroupID\_t**

Realignment Mux group ID.

Definition at line 15605 of file DCM.idl.

**8.25.2.3 typedef sequence<RMX\_GroupSettings\_t> DCM::DeviceControl::RMX\_GroupSettings\_List\_t**

A list of Realignment Mux group settings.

Definition at line 15656 of file DCM.idl.

**8.25.2.4 typedef sequence<RMX\_GroupSvc\_t> DCM::DeviceControl::RMX\_GroupSvc\_List\_t**

Definition at line 15730 of file DCM.idl.

**8.25.2.5 typedef sequence<RMX\_GroupSvcs\_t> DCM::DeviceControl::RMX\_GroupSvcs\_List\_t**

A list where each node is a set of Realignment Mux services belonging to the same group.

Definition at line 15742 of file DCM.idl.

**8.25.3 Enumeration Type Documentation****8.25.3.1 enum DCM::DeviceControl::eRMX\_GroupType\_t**

Realignment group type.

Behaviour depends on the type of the Realignment Mux group. Currently only selected services of a single TS is supported.

Enumerator:

```
eRMX_SingleTS_SelectedSvc
eRMX_GT_Reserved_1
eRMX_GT_Reserved_2 e.g. eRMX_SingleTS_AllSvc
eRMX_GT_Reserved_3 e.g. eRMX_MultiTS
eRMX_GT_Reserved_4
eRMX_GT_Reserved_5
eRMX_GT_Reserved_6
eRMX_GT_Reserved_7
eRMX_GT_Reserved_8
```

Definition at line 15617 of file DCM.idl.

**8.25.3.2 enum DCM::DeviceControl::eRMX\_ServiceStatus\_t**

Realignment Mux service status.

Passed\_Delayed: Realignment mux delay mode is being applied on the service.

Blocked\_NoMarkers: The service is blocked on the realignment mux because no s-tick markers are present.

Blocked\_NegativeDelay: The service is blocked on the realignment mux because the delay for the service is higher than the configured end-to-end delay.

NotPresent: No realignment mux is not applied on the service because the service is not present at the output.

Passed\_Undelayed: Realignment mux is not applied on the service because delay mode has been disabled or temporarily not working.

#### Enumerator:

*eRMX\_SvcStatus\_Passed\_Delayed* OK.

*eRMX\_SvcStatus\_Blocked\_NoMarkers* NOK: S-tick markers are missing.

*eRMX\_SvcStatus\_Blocked\_NegativeDelay* NOK: The delay exceeds the configured end-to-end delay. The applied delay is negative due to the actual delay that is too high.

*eRMX\_SvcStatus\_NotPresent* NOK: No service present at output.

*eRMX\_SvcStatus\_Passed\_Undelayed* NOK: Delay mode is disabled or not working.

*eRMX\_SvcStatus\_Passed\_Delayed\_NoMarkers* Still OK, but warning. Shifts after 5 secs to blocked.

*eRMX\_SvcStatus\_Passed\_Delayed\_InvalidTime* Still OK, but warning. Shifts after 60 secs to blocked.

*eRMX\_SvcStatus\_Blocked\_InvalidTime* NOK: invalid time being received from the encoder for more than 60 secs.

*eRMX\_SvcStatus\_Blocked\_IncompatibleRealignmentInfo* Transitory phenomenon: recovery of encoder from error state (<1sec).

*eRMX\_SvcStatus\_Blocked\_DejitterBufferReset* Transitory phenomenon: network jitter triggered a reset of the dejitter buffer.

*eRMX\_SvcStatus\_Blocked\_DtsStcCompOutOfLimits* Transitory phenomenon: DTS-STC compensation out-of-limits.

*eRMX\_SvcStatus\_Reserved1* Eg. Blocked\_InvalidClock (to be decided)

*eRMX\_SvcStatus\_Reserved2*

*eRMX\_SvcStatus\_Reserved3*

*eRMX\_SvcStatus\_Reserved4*

*eRMX\_SvcStatus\_Reserved5*

*eRMX\_SvcStatus\_Reserved6*

Definition at line 15681 of file DCM.idl.

### 8.25.4 Function Documentation

**8.25.4.1** void DCM::DeviceControl::RMX\_GetRealignmentBoardMode ( in unsigned short *BoardNr*, out boolean *IsEnabled* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Query the Realignment Mode of a specific board.

#### Parameters

|     |                  |                                                                |
|-----|------------------|----------------------------------------------------------------|
| in  | <i>BoardNr</i>   | The slot (board) to query whether realignment mode is enabled. |
| out | <i>IsEnabled</i> | True indicates it is enabled, false otherwise.                 |

**Exceptions**

|                        |                                                                                                  |
|------------------------|--------------------------------------------------------------------------------------------------|
| <i>Timeout</i>         | Is thrown when it takes too long to handle the call.                                             |
| <i>OperationFailed</i> | Is thrown when: <ul style="list-style-type: none"> <li>supplying an invalid board nr;</li> </ul> |

**Version**

Release 11.0

**8.25.4.2** void DCM::DeviceControl::RMX\_GroupChange ( in unsigned short *BoardNr*, in RMX\_GroupSettings\_List\_t *GroupList* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Change the settings of one or more Realignment Mux groups.

**Parameters**

|    |                  |                                                                           |
|----|------------------|---------------------------------------------------------------------------|
| in | <i>BoardNr</i>   | The slot (board) to apply the call on.                                    |
| in | <i>GroupList</i> | The list of new RMX group settings. The group IDs are used as references. |

**Exceptions**

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Timeout</i>         | Is thrown when it takes too long to handle the call.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <i>OperationFailed</i> | Is thrown when: <ul style="list-style-type: none"> <li>making call while realignment board mode is not enabled;</li> <li>supplying an invalid or non-existing board nbr;</li> <li>supplying an empty list of group settings;</li> <li>supplying a non-existing group ID;</li> <li>supplying a group name that is too long.</li> <li>supplying a different group type than the one used when creating the group;</li> <li>supplying a different location than the one used when creating the group;</li> <li>supplying an end-to-end delay that is out of range;</li> </ul> |

**Version**

Release 11.0

**8.25.4.3** void DCM::DeviceControl::RMX\_GroupCreate ( in unsigned short *BoardNr*, in RMX\_GroupSettings\_List\_t *GroupSettingsList*, out RMX\_GroupID\_List\_t *CreatedGroupIDs* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Create a set of Realignment Mux groups.

**Remarks**

Group IDs are assigned and managed by the IO board. After this assignment they are considered read-only. Group IDs that had initially been set by the caller were ignored.

## Parameters

|     |                           |                                                                                                                                |
|-----|---------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| in  | <i>BoardNr</i>            | The slot (board) to apply the call on.                                                                                         |
| in  | <i>GroupSettings-List</i> | A list of RMX group settings. (ID is ignored)                                                                                  |
| out | <i>CreatedGroup-IDs</i>   | The group IDs of the groups that were created. The IDs are returned in the same order as how the group settings were supplied. |

## Exceptions

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Timeout</i>         | Is thrown when it takes too long to handle the call.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <i>OperationFailed</i> | Is thrown when: <ul style="list-style-type: none"> <li>• making call while realignment board mode is not enabled;</li> <li>• supplying an invalid or non-existing board nbr;</li> <li>• supplying an empty list of group settings;</li> <li>• trying to create a group when there are no more groups available (out of resources);</li> <li>• supplying a group name that is too short or too long;</li> <li>• supplying an invalid group type;</li> <li>• supplying an unsupported group type (currently no single-ts-all-services nor multi-ts are supported; due to this some other exceptional cases could not yet occur);</li> <li>• supplying a multi-ts group type if the board nbr refers to an ASI board (by definition ASI has only one TS available!) [NOT YET APPLICABLE];</li> <li>• supplying a location that gives a conflict with the board nr parameter;</li> <li>• supplying a location that is invalid (ie port nbr should not be missing and neither should the TS index in case of single-ts-selected-services);</li> <li>• supplying a TS reference that is not an existing output TS reference;</li> <li>• supplying a TS reference for an output TS that is already completely part of another RMX group. (as the only member of a single-ts-all-services if it is an MPTS, or as one of the members of a multi-ts if it is an SPTS) [NOT YET APPLICABLE];</li> <li>• supplying an end-to-end delay that is out of range;</li> </ul> |

## Version

Release 11.0

**8.25.4.4** void DCM::DeviceControl::RMX\_GroupDelete ( in unsigned short *BoardNr*, in RMX\_GroupID\_List\_t *GroupIDList* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Delete one or more Realignment Mux groups.

## Remarks

Not only the group itself, but also each member of the group will be deleted.

## Parameters

|    |                    |                                              |
|----|--------------------|----------------------------------------------|
| in | <i>BoardNr</i>     | The slot (board) to apply the call on.       |
| in | <i>GroupIDList</i> | The group IDs of the groups to be retrieved. |

**Exceptions**

|                        |                                                                                                                                                                                                                                                                                                                        |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Timeout</i>         | Is thrown when it takes too long to handle the call.                                                                                                                                                                                                                                                                   |
| <i>OperationFailed</i> | Is thrown when: <ul style="list-style-type: none"> <li>• making call while realignment board mode is not enabled;</li> <li>• supplying an invalid or non-existing board nbr;</li> <li>• supplying an empty list of group IDs;</li> <li>• supplying a list of groups IDs where some of the IDs do not exist;</li> </ul> |

**Version**

Release 11.0

**8.25.4.5** void DCM::DeviceControl::RMX\_GroupGet ( in IPS\_RefTS\_t *Location*, in RMX\_GroupID\_List\_t *GroupIDList*, out RMX\_GroupSettings\_List\_t *GroupSettingsList* )  
raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Get a list of Realignment Mux group settings.

**Remarks**

Both the [IPS\\_RefTS\\_t](#) and RMX\_GroupID\_List\_t are used as filter. A) If the RMX\_GroupID\_List\_t is empty, then the [IPS\\_RefTS\\_t](#) is used as filter when retrieving the RMX group settings:

- if only the board is set (ie port is REF\_ALL): all RMX groups of the board are returned;
- if only the board and port are set: all RMX groups located on the port are returned;
- if board, port and TS are set: all RMX groups located on the TS are returned. B) If the RMX\_GroupID\_List\_t is non-empty, the group IDs are used to check against the [IPS\\_RefTS\\_t](#) and retrieve the groups.

**Parameters**

|     |                           |                                                                                                                                                       |
|-----|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| in  | <i>Location</i>           | The board, port and/or TS to retrieve the groups from.                                                                                                |
| in  | <i>GroupIDList</i>        | The group IDs of the groups to be retrieved.                                                                                                          |
| out | <i>GroupSettings-List</i> | The group settings corresponding to the group IDs that were supplied. -<br>The settings are returned in the order as how the group IDs were supplied. |

**Exceptions**

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Timeout</i>         | Is thrown when it takes too long to handle the call.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <i>OperationFailed</i> | Is thrown when: <ul style="list-style-type: none"> <li>• making call while realignment board mode is not enabled;</li> <li>• supplying an invalid or non-existing board nbr;</li> <li>• supplying a non-existing group ID;</li> <li>• supplying an inconsistent port/TS reference (ie if the port number is invalid, the TS index also should);</li> <li>• supplying a TS reference (ie <a href="#">IPS_RefTS_t</a>) referring to a non-existing location;</li> <li>• supplying a TS reference with a valid TS index that does not refer to an *output* TS;</li> <li>• supplying an inconsistent port/TS reference and group ID (ie the location of the group does not fit with one of the supplied group IDs);</li> </ul> |

**Version**

Release 11.0

**8.25.4.6** void DCM::DeviceControl::RMX\_ServiceAdd ( in unsigned short *BoardNr*, in RMX\_GroupSvcList\_t *GroupServicesList* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Add services to a Realignment Mux group.

**Remarks**

This is only allowed for groups of type SingleTS\_SelectedSvc

**Parameters**

|    |                          |                                                                                                          |
|----|--------------------------|----------------------------------------------------------------------------------------------------------|
| in | <i>BoardNr</i>           | The slot (board) to apply the call on.                                                                   |
| in | <i>GroupServicesList</i> | A list of sets of service references where each set contains all services to be added to the same group. |

## Exceptions

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <i>OperationFailed</i> | Is thrown when: <ul style="list-style-type: none"> <li>making call while realignment board mode is not enabled;</li> <li>supplying an empty list of service sets;</li> <li>supplying a list that tries to add services to a non-existing group;</li> <li>supplying a list that tries to add services to a group of the wrong type (ie services can only be added to groups of type single-ts-selected-services);</li> <li>supplying a list that contains references to non-existing services;</li> <li>supplying a list that tries to add a service to a group when it is already part of another group;</li> <li>supplying a list that tries to add a service to the group where it already belongs to;</li> <li>supplying a list where the MPTS of the services does not match the Location (MPTS) of the group where the services are to be added to;</li> <li>trying to add services such that the upper limit on the number of services is exceeded;</li> </ul> |

## Version

Release 11.0

**8.25.4.7** void DCM::DeviceControl::RMX\_ServiceDelete ( in unsigned short *BoardNr*, in RMX\_GroupSvcs\_List\_t *GroupServicesList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Delete a subset of the services that were previously added explicitly to one or more Realignment Mux groups.

## Remarks

This is only allowed for groups of type SingleTS\_SelectedSvc

## Parameters

|    |                           |                                        |
|----|---------------------------|----------------------------------------|
| in | <i>BoardNr</i>            | The slot (board) to apply the call on. |
| in | <i>GroupServices-List</i> | The list of service references         |

**Exceptions**

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Timeout</i>         | Is thrown when it takes too long to handle the call.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <i>OperationFailed</i> | Is thrown when: <ul style="list-style-type: none"> <li>• making call while realignment board mode is not enabled;</li> <li>• supplying an invalid or non-existing board nbr;</li> <li>• supplying an empty list of service references;</li> <li>• supplying a list of service references where some of the references do not exist</li> <li>• supplying a list of service references where some of the references are not part of a realignment mux group</li> <li>• supplying a list of service references where some of the references were not previously added explicitly to the group (and not yet deleted from the group)</li> </ul> |

**Version**

Release 11.0

**8.25.4.8** void DCM::DeviceControl::RMX\_ServiceGet ( in unsigned short *BoardNr*, in RMX\_GroupID\_List\_t *GroupIDList*, out RMX\_GroupSvcs\_List\_t *GroupServicesList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Get a list of services that were added explicitly.

**Remarks**

This is only allowed for groups of type SingleTS\_SelectedSvc

**Parameters**

|     |                          |                                                                                                                                                                                       |
|-----|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in  | <i>BoardNr</i>           | The slot (board) to apply the call on.                                                                                                                                                |
| in  | <i>GroupIDList</i>       | The group IDs of the groups of which the service references are to be retrieved.                                                                                                      |
| out | <i>GroupServicesList</i> | A list of sets of service references where each set consists of the references that belong to a certain group. The sets are returned in the order as how the group IDs were supplied. |

**Exceptions**

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <i>Timeout</i>         | Is thrown when it takes too long to handle the call.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <i>OperationFailed</i> | Is thrown when: <ul style="list-style-type: none"> <li>• making call while realignment board mode is not enabled;</li> <li>• supplying an invalid or non-existing board nbr;</li> <li>• supplying an empty list of group IDs;</li> <li>• supplying a list of group IDs where some of the IDs do not exist;</li> <li>• supplying a list of group IDs where some of the IDs are of the wrong type (ie services can only be retrieved from groups of type single-ts-selected-services)</li> </ul> |

**Version**

Release 11.0

**8.25.4.9** void DCM::DeviceControl::RMX\_SetRealignmentBoardMode ( in unsigned short *BoardNr*, in boolean *Enable* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Enable/disable Realignment Mode on a specific board.

**Parameters**

|    |                |                                                         |
|----|----------------|---------------------------------------------------------|
| in | <i>BoardNr</i> | The slot (board) to enable/disable realignment mode on. |
| in | <i>Enable</i>  | Enable realignment mode if true, disable otherwise.     |

**Exceptions**

|                        |                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Timeout</i>         | Is thrown when it takes too long to handle the call.                                                                                                                                                                                                                                                                                                                |
| <i>OperationFailed</i> | Is thrown when: <ul style="list-style-type: none"><li>• supplying an invalid board nr;</li><li>• trying to enable realignment mode while another feature requiring the co-processor is active on at least one service of the board;</li><li>• trying to disable realignment mode while there are still realignment mux groups configured on the IO-board;</li></ul> |

**Version**

Release 11.0

## 8.26 MFP Statmux staging

This contains specific types, enums and methods for controlling the MFP Statmuxing.

### Classes

- struct [DCM::DeviceControl::SMX\\_MFP\\_GroupSettings\\_t](#)  
*Statmux group settings The Type of the SMXGroup is important concerning further behavior and meanings of the different fields.*
- struct [DCM::DeviceControl::SMX\\_MFP\\_TsSettings\\_t](#)  
*Data linked with a TS in statmux context.*
- struct [DCM::DeviceControl::SMX\\_MFP\\_Group\\_TSSettings\\_t](#)  
*List of TS settings on Statmux group Can be used to add/get TS to/from a group.*
- struct [DCM::DeviceControl::SMX\\_MFP\\_Group\\_TSs\\_t](#)  
*List of TS on a Statmux group, used for deleting TS from gorup.*
- struct [DCM::DeviceControl::SMX\\_MFP\\_SvcSettings\\_t](#)  
*Statmux setting of a service.*
- struct [DCM::DeviceControl::SMX\\_MFP\\_SvcSettings\\_V2\\_t](#)  
*Statmux setting of a service, Version 2.*
- struct [DCM::DeviceControl::SMX\\_MFP\\_Group\\_SvcSettings\\_t](#)  
*Service settings within a group.*
- struct [DCM::DeviceControl::SMX\\_MFP\\_Group\\_SvcSettings\\_V2\\_t](#)  
*Service settings within a group.*
- struct [DCM::DeviceControl::SMX\\_MFP\\_Group\\_Svc\\_t](#)  
*Services in a group.*

### Typedefs

- typedef sequence < [SMX\\_MFP\\_GroupSettings\\_t](#) > [DCM::DeviceControl::SMX\\_MFP\\_GroupSettings\\_List\\_t](#)  
*A sequence of Statmux group settings.*
- typedef sequence< unsigned long > [DCM::DeviceControl::SMX\\_MFP\\_GroupID\\_List\\_t](#)  
*list of group ids.*
- typedef sequence < [SMX\\_MFP\\_TsSettings\\_t](#) > [DCM::DeviceControl::SMX\\_MFP\\_TsSettings\\_List\\_t](#)  
*A sequence of Statmux Transport Stream settings.*
- typedef sequence < [SMX\\_MFP\\_Group\\_TSSettings\\_t](#) > [DCM::DeviceControl::SMX\\_MFP\\_Group\\_TSSettings\\_List\\_t](#)  
*A sequence of [SMX\\_MFP\\_Group\\_TSSettings\\_t](#).*
- typedef sequence < [SMX\\_MFP\\_Group\\_TSs\\_t](#) > [DCM::DeviceControl::SMX\\_MFP\\_Group\\_TSs\\_List\\_t](#)  
*A sequence of [SMX\\_MFP\\_Group\\_TSs\\_t](#).*
- typedef sequence < [SMX\\_MFP\\_SvcSettings\\_t](#) > [DCM::DeviceControl::SMX\\_MFP\\_SvcSettings\\_List\\_t](#)  
*A sequence of Statmux services.*
- typedef sequence < [SMX\\_MFP\\_SvcSettings\\_V2\\_t](#) > [DCM::DeviceControl::SMX\\_MFP\\_SvcSettings\\_V2\\_List\\_t](#)  
*A sequence of Statmux services.*

- typedef sequence < SMX\_MFP\_Group\_SvcSettings\_t > DCM::DeviceControl::SMX\_MFP\_Group\_SvcSettings\_List\_t  
A sequence of *SMX\_MFP\_Group\_SvcSettings\_t*.
- typedef sequence < SMX\_MFP\_Group\_SvcSettings\_V2\_t > DCM::DeviceControl::SMX\_MFP\_Group\_SvcSettings\_V2\_List\_t  
A sequence of *SMX\_MFP\_Group\_SvcSettings\_V2\_t*.
- typedef sequence < SMX\_MFP\_Group\_Svc\_t > DCM::DeviceControl::SMX\_MFP\_Group\_Svc\_List\_t  
A sequence of *SMX\_MFP\_Group\_Svc\_t*.

### Enumerations

- enum DCM::DeviceControl::eSMX\_MFP\_GroupType\_t { DCM::DeviceControl::eSMX\_MFP\_MultiTS, DCM::DeviceControl::eSMX\_MFP\_SingleTS\_AllSvc, DCM::DeviceControl::eSMX\_MFP\_SingleTS\_SelectedSvc, DCM::DeviceControl::eSMX\_MFP\_GT\_Reserved\_3, DCM::DeviceControl::eSMX\_MFP\_GT\_Reserved\_4, DCM::DeviceControl::eSMX\_MFP\_GT\_Reserved\_5, DCM::DeviceControl::eSMX\_MFP\_GT\_Reserved\_6, DCM::DeviceControl::eSMX\_MFP\_GT\_Reserved\_7, DCM::DeviceControl::eSMX\_MFP\_GT\_Reserved\_8, DCM::DeviceControl::eSMX\_MFP\_GT\_Reserved\_9, DCM::DeviceControl::eSMX\_MFP\_GT\_Reserved\_10, DCM::DeviceControl::eSMX\_MFP\_GT\_Reserved\_11, DCM::DeviceControl::eSMX\_MFP\_GT\_Reserved\_12, DCM::DeviceControl::eSMX\_MFP\_GT\_Reserved\_13, DCM::DeviceControl::eSMX\_MFP\_GT\_Reserved\_14, DCM::DeviceControl::eSMX\_MFP\_GT\_Reserved\_15 }  
*Statmux group type.*
- enum DCM::DeviceControl::eSMX\_MFP\_SvcState { DCM::DeviceControl::eSMX\_MFP\_SvcState\_StatMux, DCM::DeviceControl::eSMX\_MFP\_SvcState\_PassThrough, DCM::DeviceControl::eSMX\_MFP\_SvcState\_CBR, DCM::DeviceControl::eSMX\_MFP\_SvcState\_CappedVBR, DCM::DeviceControl::eSMX\_MFP\_SvcState\_PassThroughMeasurable, DCM::DeviceControl::eSMX\_MFP\_SvcState\_Reserved\_5, DCM::DeviceControl::eSMX\_MFP\_SvcState\_Reserved\_6, DCM::DeviceControl::eSMX\_MFP\_SvcState\_Reserved\_7, DCM::DeviceControl::eSMX\_MFP\_SvcState\_Reserved\_8, DCM::DeviceControl::eSMX\_MFP\_SvcState\_Reserved\_9, DCM::DeviceControl::eSMX\_MFP\_SvcState\_Reserved\_10, DCM::DeviceControl::eSMX\_MFP\_SvcState\_Reserved\_11, DCM::DeviceControl::eSMX\_MFP\_SvcState\_Reserved\_12, DCM::DeviceControl::eSMX\_MFP\_SvcState\_Reserved\_13, DCM::DeviceControl::eSMX\_MFP\_SvcState\_Reserved\_14, DCM::DeviceControl::eSMX\_MFP\_SvcState\_Reserved\_15 }  
*The mode of a service.*
- enum DCM::DeviceControl::eSMX\_MFP\_SvcMode { DCM::DeviceControl::eSMX\_MFP\_SvcMode\_StatMux, DCM::DeviceControl::eSMX\_MFP\_SvcMode\_RateLimit, DCM::DeviceControl::eSMX\_MFP\_SvcMode\_Reserved\_2, DCM::DeviceControl::eSMX\_MFP\_SvcMode\_Reserved\_3, DCM::DeviceControl::eSMX\_MFP\_SvcMode\_Reserved\_4, DCM::DeviceControl::eSMX\_MFP\_SvcMode\_Reserved\_5, DCM::DeviceControl::eSMX\_MFP\_SvcMode\_Reserved\_6, DCM::DeviceControl::eSMX\_MFP\_SvcMode\_Reserved\_7, DCM::DeviceControl::eSMX\_MFP\_SvcMode\_Reserved\_8, DCM::DeviceControl::eSMX\_MFP\_SvcMode\_Reserved\_9, DCM::DeviceControl::eSMX\_MFP\_SvcMode\_Reserved\_10, DCM::DeviceControl::eSMX\_MFP\_SvcMode\_Reserved\_11, DCM::DeviceControl::eSMX\_MFP\_SvcMode\_Reserved\_12, DCM::DeviceControl::eSMX\_MFP\_SvcMode\_Reserved\_13, DCM::DeviceControl::eSMX\_MFP\_SvcMode\_Reserved\_14, DCM::DeviceControl::eSMX\_MFP\_SvcMode\_Reserved\_15 }  
*The Statmux mode of a service.*
- enum DCM::DeviceControl::eSMX\_MFP\_PassThroughMode { DCM::DeviceControl::eSMX\_MFP\_PassThroughMode\_Measured, DCM::DeviceControl::eSMX\_MFP\_PassThroughMode\_UnMeasured, DCM::DeviceControl::eSMX\_MFP\_PassThroughMode\_Reserved\_2, DCM::DeviceControl::eSMX\_MFP\_PassThroughMode\_Reserved\_3, DCM::DeviceControl::eSMX\_MFP\_PassThroughMode\_Reserved\_4, DCM::DeviceControl::eSMX\_MFP\_PassThroughMode\_Reserved\_5, DCM::DeviceControl::eSMX\_MFP\_PassThroughMode\_Reserved\_6, DCM::DeviceControl::eSMX\_MFP\_PassThroughMode\_Reserved\_7, DCM::DeviceControl::eSMX\_MFP\_PassThroughMode\_Reserved\_8, DCM::DeviceControl::eSMX\_MFP\_PassThroughMode\_Reserved\_9, DCM::DeviceControl::eSMX\_MFP\_PassThroughMode\_Reserved\_10, DCM::DeviceControl::eSMX\_MFP\_PassThroughMode\_Reserved\_11, DCM::DeviceControl::eSMX\_MFP\_PassThroughMode\_Reserved\_12, DCM::DeviceControl::eSMX\_MFP\_PassThroughMode\_Reserved\_13, DCM::DeviceControl::eSMX\_MFP\_PassThroughMode\_Reserved\_14, DCM::DeviceControl::eSMX\_MFP\_PassThroughMode\_Reserved\_15 }

Reserved_4, DCM::DeviceControl::eSMX_MFP_PassThroughMode_Reserved_5, DCM::DeviceControl::eSMX_MFP_PassThroughMode_Reserved_6, DCM::DeviceControl::eSMX_MFP_PassThroughMode_Reserved_7, DCM::DeviceControl::eSMX_MFP_PassThroughMode_Reserved_8, DCM::DeviceControl::eSMX_MFP_PassThroughMode_Reserved_9, DCM::DeviceControl::eSMX_MFP_PassThroughMode_Reserved_10, DCM::DeviceControl::eSMX_MFP_PassThroughMode_Reserved_11, DCM::DeviceControl::eSMX_MFP_PassThroughMode_Reserved_12, DCM::DeviceControl::eSMX_MFP_PassThroughMode_Reserved_13, DCM::DeviceControl::eSMX_MFP_PassThroughMode_Reserved_14, DCM::DeviceControl::eSMX_MFP_PassThroughMode_Reserved_15 }
```

*The PassThrough mode of a service.*

## Functions

- void [DCM::DeviceControl::SMX\\_MFP\\_GroupCreate](#) (in unsigned short BoardNr, in SMX\_MFP\_GroupSettings\_List\_t GroupSettingsList, out SMX\_MFP\_GroupID\_List\_t CreatedGroupIDs) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)  
*Request to create a list of statmux groups.*
- void [DCM::DeviceControl::SMX\\_MFP\\_GroupGet](#) (in IPS\_RefTS\_t RefTs, in SMX\_MFP\_GroupID\_List\_t GroupIDList, out SMX\_MFP\_GroupSettings\_List\_t GroupSettingsList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)  
*Gets the list of statmux group settings.*
- void [DCM::DeviceControl::SMX\\_MFP\\_GroupChange](#) (in unsigned short BoardNr, in SMX\_MFP\_GroupSettings\_List\_t GroupList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)  
*Change the settings of statmux group(s).*
- void [DCM::DeviceControl::SMX\\_MFP\\_GroupDelete](#) (in unsigned short BoardNr, in SMX\_MFP\_GroupID\_List\_t GroupIDList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)  
*Delete statmux group(s).*
- void [DCM::DeviceControl::SMX\\_MFP\\_TSAdd](#) (in unsigned short BoardNr, in SMX\_MFP\_Group\_TSSettings\_List\_t GroupTSList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)  
*Add complete mux output transport stream(s) to statmux group(s).*
- void [DCM::DeviceControl::SMX\\_MFP\\_TSGet](#) (in unsigned short BoardNr, in SMX\_MFP\_GroupID\_List\_t GroupIDList, out SMX\_MFP\_Group\_TSSettings\_List\_t GroupTSList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)  
*Gets a list of TSs settings that are part of the statmux group(s).*
- void [DCM::DeviceControl::SMX\\_MFP\\_TSChange](#) (in unsigned short BoardNr, in SMX\_MFP\_Group\_TSSettings\_List\_t GroupTSList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)  
*Change a list of TSs settings that are part of the statmux group(s).*
- void [DCM::DeviceControl::SMX\\_MFP\\_TSDelete](#) (in unsigned short BoardNr, in SMX\_MFP\_Group\_TS\_List\_t GroupTSList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)  
*Delete TS(s) from statmux group(s).*
- void [DCM::DeviceControl::SMX\\_MFP\\_SvcSettingGet](#) (in unsigned short BoardNr, in SMX\_MFP\_GroupID\_List\_t GroupIDList, out SMX\_MFP\_Group\_SvcSettings\_List\_t GroupSvcList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)  
*Retrieve the Service settings from a group.*
- void [DCM::DeviceControl::SMX\\_MFP\\_SvcSettingGet\\_V2](#) (in unsigned short BoardNr, in SMX\_MFP\_GroupID\_List\_t GroupIDList, out SMX\_MFP\_Group\_SvcSettings\_V2\_List\_t GroupSvcList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

*Retrieve the Service settings from a group.*

- void [DCM::DeviceControl::SMX\\_MFP\\_SvcSettingChange](#) (in unsigned short BoardNr, in SMX\_MFP\_Group\_SvcSettings\_List\_t GroupSvcList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

*Update the Service settings from a group.*

- void [DCM::DeviceControl::SMX\\_MFP\\_SvcSettingChange\\_V2](#) (in unsigned short BoardNr, in SMX\_MFP\_Group\_SvcSettings\_V2\_List\_t GroupSvcList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

*Update the Service settings from a group.*

- void [DCM::DeviceControl::SMX\\_MFP\\_ServiceAdd](#) (in unsigned short BoardNr, in SMX\_MFP\_Group\_Svc\_List\_t GroupServiceList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

*Add services to a SingleTS\_SelectedSvc statmux group.*

- void [DCM::DeviceControl::SMX\\_MFP\\_ServiceGet](#) (in unsigned short BoardNr, in SMX\_MFP\_GroupID\_List\_t GroupIDList, out SMX\_MFP\_Group\_Svc\_List\_t GroupServiceList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

*Gets the list of services added explicitly (eSMX\_MFP\_SingleTS\_SelectedSvc group)*

- void [DCM::DeviceControl::SMX\\_MFP\\_ServiceDelete](#) (in unsigned short BoardNr, in SMX\_MFP\_Group\_Svc\_List\_t GroupServiceList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

*Delete a sequence of service that were previously added to statmux group(s).*

## Variables

- const unsigned long [DCM::DeviceControl::SMX\\_MFP\\_MIN\\_GROUP\\_ID](#) = 10000  
*GroupIDs for MFP Statmuxing uses between 10000 and 19999.*
- const unsigned long [DCM::DeviceControl::SMX\\_MFP\\_MAX\\_GROUP\\_ID](#) = 19999

### 8.26.1 Detailed Description

This contains specific types, enums and methods for controlling the MFP Statmuxing.

## Remarks

This follows pretty close the transrater statmux group management. The SMX\_MFP prefix is used in all related calls.

### 8.26.2 Typedef Documentation

#### 8.26.2.1 typedef sequence<SMX\_MFP\_Group\_Svc\_t> DCM::DeviceControl::SMX\_MFP\_Group\_Svc\_List\_t

A sequence of [SMX\\_MFP\\_Group\\_Svc\\_t](#).

Definition at line 16299 of file DCM.idl.

#### 8.26.2.2 typedef sequence<SMX\_MFP\_Group\_SvcSettings\_t> DCM::DeviceControl::SMX\_MFP\_Group\_SvcSettings\_List\_t

A sequence of [SMX\\_MFP\\_Group\\_SvcSettings\\_t](#).

Definition at line 16277 of file DCM.idl.

**8.26.2.3** `typedef sequence<SMX_MFP_Group_SvcSettings_V2_t> DCM::DeviceControl::SMX_MFP_Group_SvcSettings_V2_List_t`

A sequence of [SMX\\_MFP\\_Group\\_SvcSettings\\_V2\\_t](#).

Definition at line 16288 of file DCM.idl.

**8.26.2.4** `typedef sequence<SMX_MFP_Group_TSs_t> DCM::DeviceControl::SMX_MFP_Group_TS_List_t`

A sequence of [SMX\\_MFP\\_Group\\_TSs\\_t](#).

Definition at line 16206 of file DCM.idl.

**8.26.2.5** `typedef sequence<SMX_MFP_Group_TSSettings_t> DCM::DeviceControl::SMX_MFP_Group_TSSettings_List_t`

A sequence of [SMX\\_MFP\\_Group\\_TSSettings\\_t](#).

Definition at line 16197 of file DCM.idl.

**8.26.2.6** `typedef sequence<unsigned long> DCM::DeviceControl::SMX_MFP_GroupID_List_t`

list of group ids.

Definition at line 16170 of file DCM.idl.

**8.26.2.7** `typedef sequence<SMX_MFP_GroupSettings_t> DCM::DeviceControl::SMX_MFP_GroupSettings_List_t`

A sequence of Statmux group settings.

Definition at line 16169 of file DCM.idl.

**8.26.2.8** `typedef sequence<SMX_MFP_SvcSettings_t> DCM::DeviceControl::SMX_MFP_SvcSettings_List_t`

A sequence of Statmux services.

Definition at line 16238 of file DCM.idl.

**8.26.2.9** `typedef sequence<SMX_MFP_SvcSettings_V2_t> DCM::DeviceControl::SMX_MFP_SvcSettings_V2_List_t`

A sequence of Statmux services.

Definition at line 16264 of file DCM.idl.

**8.26.2.10** `typedef sequence<SMX_MFP_TsSettings_t> DCM::DeviceControl::SMX_MFP_TsSettings_List_t`

A sequence of Statmux Transport Stream settings.

Definition at line 16183 of file DCM.idl.

**8.26.3** Enumeration Type Documentation

## 8.26.3.1 enum DCM::DeviceControl::eSMX\_MFP\_GroupType\_t

Statmux group type.

Depending on the type of the statmux group, behavior will be different;

- MultiTS : such a SMXGroup will be located at output port level. Thus of SMX\_MFP\_GroupSettings\_t.Location.Ref will be 0xFFFFFFFF (only PhysRef of the Location will be used). In such group multiple TS can be added as long these output TS are located at the same port (aka their IPS\_Ref\_t is the same as the IPS\_Ref\_t in the SMX\_MFP\_GroupSettings\_t.Location).
- SingleTS\_AllSvc : such a group will be located at TS level. Thus the SMX\_MFP\_GroupSettings\_t.Location will be a TS. In such group all services of the TS are automatically member of the statmux group.
- SingleTS\_SelectedSvc : such a group will be located at TS level. Thus the SMX\_MFP\_GroupSettings\_t.Location will be a TS. In such group services of the TS are NOT automatically member of the statmux group, so they have to be added manually.

Enumerator:

*eSMX\_MFP\_MultiTS* SMX group that can contain multiple TS from a Port.

*eSMX\_MFP\_SingleTS\_AllSvc* SMX group that can contain only one TS, for which all Services are statmuxed.

*eSMX\_MFP\_SingleTS\_SelectedSvc* SMX group that can contain selective services from one TS.

*eSMX\_MFP\_GT\_Reserved\_3*

*eSMX\_MFP\_GT\_Reserved\_4*

*eSMX\_MFP\_GT\_Reserved\_5*

*eSMX\_MFP\_GT\_Reserved\_6*

*eSMX\_MFP\_GT\_Reserved\_7*

*eSMX\_MFP\_GT\_Reserved\_8*

*eSMX\_MFP\_GT\_Reserved\_9*

*eSMX\_MFP\_GT\_Reserved\_10*

*eSMX\_MFP\_GT\_Reserved\_11*

*eSMX\_MFP\_GT\_Reserved\_12*

*eSMX\_MFP\_GT\_Reserved\_13*

*eSMX\_MFP\_GT\_Reserved\_14*

*eSMX\_MFP\_GT\_Reserved\_15*

Definition at line 16028 of file DCM.idl.

## 8.26.3.2 enum DCM::DeviceControl::eSMX\_MFP\_PassThroughMode

The PassThrough mode of a service.

If a service is in PassThrough, it is possible to enable Measuring of its bitrate (taking it automatically into account in the statmux group rate). If not enabled, the bitrate should manually be set using reserved bitrate of the statmux group.

Enumerator:

*eSMX\_MFP\_PassThroughMode\_Measured* Measure the bitrate and take it automatically into account in the group rate.

*eSMX\_MFP\_PassThroughMode\_UnMeasured* Not measured: manually set reserved bitrate.  
*eSMX\_MFP\_PassThroughMode\_Reserved\_2*  
*eSMX\_MFP\_PassThroughMode\_Reserved\_3*  
*eSMX\_MFP\_PassThroughMode\_Reserved\_4*  
*eSMX\_MFP\_PassThroughMode\_Reserved\_5*  
*eSMX\_MFP\_PassThroughMode\_Reserved\_6*  
*eSMX\_MFP\_PassThroughMode\_Reserved\_7*  
*eSMX\_MFP\_PassThroughMode\_Reserved\_8*  
*eSMX\_MFP\_PassThroughMode\_Reserved\_9*  
*eSMX\_MFP\_PassThroughMode\_Reserved\_10*  
*eSMX\_MFP\_PassThroughMode\_Reserved\_11*  
*eSMX\_MFP\_PassThroughMode\_Reserved\_12*  
*eSMX\_MFP\_PassThroughMode\_Reserved\_13*  
*eSMX\_MFP\_PassThroughMode\_Reserved\_14*  
*eSMX\_MFP\_PassThroughMode\_Reserved\_15*

Definition at line 16118 of file DCM.idl.

### 8.26.3.3 enum DCM::DeviceControl::eSMX\_MFP\_SvcMode

The Statmux mode of a service.

This is a setting, which is only configurable for encoders being in the eSMX\_MFP\_SvcState\_StatMux state (aka they are not in CBR/Cap-VBR/.. states) Only the one service belonging to a SPTS can be put in rate limit mode.

Enumerator:

*eSMX\_MFP\_SvcMode\_StatMux* The service is Statmuxed by the SMX group.  
*eSMX\_MFP\_SvcMode\_RateLimit* The service is used in rate limited mode.  
*eSMX\_MFP\_SvcMode\_Reserved\_2*  
*eSMX\_MFP\_SvcMode\_Reserved\_3*  
*eSMX\_MFP\_SvcMode\_Reserved\_4*  
*eSMX\_MFP\_SvcMode\_Reserved\_5*  
*eSMX\_MFP\_SvcMode\_Reserved\_6*  
*eSMX\_MFP\_SvcMode\_Reserved\_7*  
*eSMX\_MFP\_SvcMode\_Reserved\_8*  
*eSMX\_MFP\_SvcMode\_Reserved\_9*  
*eSMX\_MFP\_SvcMode\_Reserved\_10*  
*eSMX\_MFP\_SvcMode\_Reserved\_11*  
*eSMX\_MFP\_SvcMode\_Reserved\_12*  
*eSMX\_MFP\_SvcMode\_Reserved\_13*  
*eSMX\_MFP\_SvcMode\_Reserved\_14*  
*eSMX\_MFP\_SvcMode\_Reserved\_15*

Definition at line 16088 of file DCM.idl.

## 8.26.3.4 enum DCM::DeviceControl::eSMX\_MFP\_SvcState

The mode of a service.

This is a status, which is read-only. It cannot be adapted by MFP Statmux related calls. It is a property of an MFP encoder and can only be changed by MFP IIOP calls.

## Enumerator:

- eSMX\_MFP\_SvcState\_StatMux* The encoder is running in Statmux mode.
- eSMX\_MFP\_SvcState\_PassThrough* The encoder is running in pass-through mode, not measured.
- eSMX\_MFP\_SvcState\_CBR* The encoder is running in CBR mode.
- eSMX\_MFP\_SvcState\_CappedVBR* The encoder is running in C-VBR mode.
- eSMX\_MFP\_SvcState\_PassThroughMeasurable* The encoder is running in pass-through mode and can be measured (bitrate taken into account if PassThroughMode is eSMX\_MFP\_PassThroughMode\_Measured).
- eSMX\_MFP\_SvcState\_Reserved\_5*
- eSMX\_MFP\_SvcState\_Reserved\_6*
- eSMX\_MFP\_SvcState\_Reserved\_7*
- eSMX\_MFP\_SvcState\_Reserved\_8*
- eSMX\_MFP\_SvcState\_Reserved\_9*
- eSMX\_MFP\_SvcState\_Reserved\_10*
- eSMX\_MFP\_SvcState\_Reserved\_11*
- eSMX\_MFP\_SvcState\_Reserved\_12*
- eSMX\_MFP\_SvcState\_Reserved\_13*
- eSMX\_MFP\_SvcState\_Reserved\_14*
- eSMX\_MFP\_SvcState\_Reserved\_15*

Definition at line 16057 of file DCM.idl.

## 8.26.4 Function Documentation

**8.26.4.1** void DCM::DeviceControl::SMX\_MFP\_GroupChange ( in unsigned short *BoardNr*, in SMX\_MFP\_GroupSettings\_List\_t *GroupList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Change the settings of statmux group(s).

## Parameters

|    |                  |                                                                                                                                                  |
|----|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>BoardNr</i>   | The slot (board) to apply the call on.                                                                                                           |
| in | <i>GroupList</i> | A sequence of <a href="#">SMX_MFP_GroupSettings_t</a> objects <ul style="list-style-type: none"> <li>• Group ID is used as reference.</li> </ul> |

**Exceptions**

|                        |                                                                                                                                                                                                                                                                                                                                                   |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OperationFailed</i> | Is thrown: <ul style="list-style-type: none"> <li>• if BoardNr is not valid</li> <li>• if the group ID is invalid</li> <li>• if trying to change the group type (read-only parameter)</li> <li>• if trying to change the location (write once on creation)</li> <li>• if group bitrate is out of range</li> <li>• if name is too long.</li> </ul> |
| <i>TimeOut</i>         | Is thrown when it takes too long to handle the call.                                                                                                                                                                                                                                                                                              |

**Version**

Release 10.0.5

**8.26.4.2** void DCM::DeviceControl::SMX\_MFP\_GroupCreate ( in unsigned short *BoardNr*, in SMX\_MFP\_GroupSettings\_List\_t *GroupSettingsList*, out SMX\_MFP\_GroupID\_List\_t *CreatedGroupIDs* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Request to create a list of statmux groups.

Group IDs are assigned and managed by the IO Board, they are read-only and content set by the caller is ignored.

**Parameters**

|     |                           |                                                                               |
|-----|---------------------------|-------------------------------------------------------------------------------|
| in  | <i>BoardNr</i>            | The slot (board) to apply the call on.                                        |
| in  | <i>GroupSettings-List</i> | A sequence of <a href="#">SMX_MFP_GroupSettings_t</a> objects - ID is ignored |
| out | <i>CreatedGroup-IDs</i>   | the assigned group IDs (same order as the GroupSettingsList input)            |

**Exceptions**

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

### Version

Release 10.0.5

**8.26.4.3** void DCM::DeviceControl::SMX\_MFP\_GroupDelete ( in unsigned short *BoardNr*, in SMX\_MFP\_GroupID\_List\_t *GroupIDList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Delete statmux group(s).

Deleting a group means what it says: every member (TS or Svc) of the group is also removed.

### Parameters

|    |                    |                                                                 |
|----|--------------------|-----------------------------------------------------------------|
| in | <i>BoardNr</i>     | The slot(board) to apply the call on.                           |
| in | <i>GroupIDList</i> | A sequence of group IDs for the groups that have to be deleted. |

### Exceptions

|                        |                                                                                                                           |
|------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <i>OperationFailed</i> | Is thrown: <ul style="list-style-type: none"> <li>• if BoardNr is not valid</li> <li>• if group ID is invalid.</li> </ul> |
| <i>TimeOut</i>         | Is thrown when it takes too long to handle the call.                                                                      |

### Version

Release 10.0.5

**8.26.4.4** void DCM::DeviceControl::SMX\_MFP\_GroupGet ( in IPS\_RefTS\_t *RefTs*, in SMX\_MFP\_GroupID\_List\_t *GroupIDList*, out SMX\_MFP\_GroupSettings\_List\_t *GroupSettingsList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Gets the list of statmux group settings.

It is possible to get the whole list if an empty RefTS list is passed Refs parameter.

### Remarks

Both the RefTs as the GroupIDList are used as filter. If the GroupIDList is empty, then the RefPhys is used as filter for the SMX groups to retrieve:

- if only board set (thus port is REF\_ALL): all Groups on board
- if only board/port set: all Groups located on this port
- if board/port/TS is set: all Groups located on this TS If the GroupIDList is not empty, these groups are retrieved and checked against the RefTs (which should fit the location as defined in the three cases above).

**Parameters**

|     |                           |                                                                                                        |
|-----|---------------------------|--------------------------------------------------------------------------------------------------------|
| in  | <i>RefTs</i>              | The slot(board)/port/TS to retrieve the groups from (filter criterium)                                 |
| in  | <i>GroupIDList</i>        | A SMX_MFP_GroupID_List_t list of group IDs. This can be an empty list (in which case all are returned) |
| out | <i>GroupSettings-List</i> | list of retrieved settings                                                                             |

**Exceptions**

|                        |                                                                                                                                                                                                                             |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OperationFailed</i> | Is thrown when: <ul style="list-style-type: none"> <li>• if RefTs is not valid.</li> <li>• if an invalid group ID is used.</li> <li>• if the group ID requested its location does not fit with the RefTS filter.</li> </ul> |
| <i>TimeOut</i>         | Is thrown when it takes too long to handle the call.                                                                                                                                                                        |

**Version**

Release 10.0.5

**8.26.4.5** void DCM::DeviceControl::SMX\_MFP\_ServiceAdd ( in unsigned short *BoardNr*, in SMX\_MFP\_Group\_Svc\_List\_t *GroupServiceList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Add services to a SingleTS\_SelectedSvc statmux group.

This is only allowed for SingleTS\_SelectedSvc groups.

**Remarks**

To retrieve the services use the [SMX\\_MFP\\_SvcSettingGet\(\)](#) call To change service settings use the [SMX\\_MFP\\_SvcSettingChange\(\)](#) call

**Parameters**

|    |                          |                                                        |
|----|--------------------------|--------------------------------------------------------|
| in | <i>BoardNr</i>           | The slot(board) to apply the call on.                  |
| in | <i>GroupService-List</i> | The sequence of GroupID/services that should be added. |

**Exceptions**

|                        |                                                                                                                                                                                                                                                                                                                                                            |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OperationFailed</i> | Is thrown: <ul style="list-style-type: none"> <li>• if BoardNr is not valid</li> <li>• if group ID does not exists</li> <li>• if group is not of type eSMX_MFP_SingleTS_SelectedSvc</li> <li>• id service ref does not exist</li> <li>• if the statmux group is not of the correct type,</li> <li>• if the service is already part of the group</li> </ul> |
| <i>TimeOut</i>         | Is thrown when it takes too long to handle the call.                                                                                                                                                                                                                                                                                                       |

**Version**

Release 10.0.5

**8.26.4.6** void DCM::DeviceControl::SMX\_MFP\_ServiceDelete ( in unsigned short *BoardNr*, in SMX\_MFP\_Group\_Svc\_List\_t *GroupServiceList* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Delete a sequence of service that were previously added to statmux group(s).

This will only be allowed for eSMX\_MFP\_SingleTS\_SelectedSvc groups, i.e. for services that were added explicitly.

**Parameters**

|    |                          |                                                                         |
|----|--------------------------|-------------------------------------------------------------------------|
| in | <i>BoardNr</i>           | The slot(board) to apply the call on.                                   |
| in | <i>GroupService-List</i> | The sequence of group ID(s) - service relations that need to be removed |

**Exceptions**

|                        |                                                                                                                                                                                                                                                                 |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OperationFailed</i> | Is thrown: <ul style="list-style-type: none"> <li>• if BoardNr is not valid</li> <li>• if group ID does not exists</li> <li>• if the statmux group is not of the eSMX_MFP_SingleTS_SelectedSvc type</li> <li>• if a service is not part of the group</li> </ul> |
| <i>Timeout</i>         | Is thrown when it takes too long to handle the call.                                                                                                                                                                                                            |

**Version**

Release 10.0.5

**8.26.4.7** void DCM::DeviceControl::SMX\_MFP\_ServiceGet ( in unsigned short *BoardNr*, in SMX\_MFP\_GroupID\_List\_t *GroupIDList*, out SMX\_MFP\_Group\_Svc\_List\_t *GroupServiceList* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Gets the list of services added explicitly (eSMX\_MFP\_SingleTS\_SelectedSvc group)

This will return all services explicitly added to a group

**Parameters**

|     |                          |                                                           |
|-----|--------------------------|-----------------------------------------------------------|
| in  | <i>BoardNr</i>           | The slot(board) to apply the call on.                     |
| in  | <i>GroupIDList</i>       | The sequence of group IDs the services are requested for. |
| out | <i>GroupService-List</i> | Svc members from these groups                             |

**Exceptions**

|                        |                                                                                                                                                                                                         |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OperationFailed</i> | Is thrown when: <ul style="list-style-type: none"> <li>• if BoardNr is not valid</li> <li>• if an invalid group ID is used.</li> <li>• if group is not of type eSMX_MFP_SingleTS_SelectedSvc</li> </ul> |
| <i>TimeOut</i>         | Is thrown when it takes too long to handle the call.                                                                                                                                                    |

**Version**

Release 10.0.5

**8.26.4.8** void DCM::DeviceControl::SMX\_MFP\_SvcSettingChange ( in unsigned short *BoardNr*, in SMX\_MFP\_Group\_SvcSettings\_List\_t *GroupSvcList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Update the Service settings from a group.

Remark that the SvcAdd (as supported on SingleTS\_Selected Svc) does not set Svc settings (min/max bitrate, prioritys, ...). These can only be retrieved and set by using the SMX\_MFP\_SvcSettingsGet/Set calls.

**Remarks**

In case the sSMX\_MFP\_SvcState is not Statmux, then the sSMX\_MFP\_SvcMode set is ignored.

**Parameters**

|    |                     |                                         |
|----|---------------------|-----------------------------------------|
| in | <i>BoardNr</i>      | The slot(board) to apply the call on.   |
| in | <i>GroupSvcList</i> | Svc members and settings to be changed. |

**Exceptions**

|                        |                                                                                                                                                                                                                                                |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OperationFailed</i> | Is thrown: <ul style="list-style-type: none"> <li>• if BoardNr is not valid</li> <li>• if a group ID does not exist</li> <li>• if MinBitrate out of range</li> <li>• if MaxBitrate out of range</li> <li>• if priority out of range</li> </ul> |
| <i>TimeOut</i>         | Is thrown when it takes too long to handle the call.                                                                                                                                                                                           |

**Version**

Release 10.0.5

**8.26.4.9** void DCM::DeviceControl::SMX\_MFP\_SvcSettingChange\_V2 ( in unsigned short *BoardNr*, in SMX\_MFP\_Group\_SvcSettings\_V2\_List\_t *GroupSvcList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Update the Service settings from a group.

#### Version

Release 11.10

**8.26.4.10** void DCM::DeviceControl::SMX\_MFP\_SvcSettingGet ( in unsigned short *BoardNr*, in SMX\_MFP\_GroupID\_List\_t *GroupIDList*, out SMX\_MFP\_Group\_SvcSettings\_List\_t *GroupSvcList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Retrieve the Service settings from a group.

This will return settings from all services belonging to a group, also the implicit ones in the case of MultiTS and SingleTS\_AllSvc groups (where you cannot add services explicitly). For SingleTS\_SelectedSvc groups the settings of the explicitly added services will be retrieved. Remark that the SvcAdd (as supported on SingleTS\_Selected Svc) does not set Svc settings (min/max bitrate, priorities, ...). These can only be retrieved and set by using the SMX\_MFP\_SvcSettingsGet/Change calls.

#### Parameters

|     |                     |                                                                   |
|-----|---------------------|-------------------------------------------------------------------|
| in  | <i>BoardNr</i>      | The slot(board) to apply the call on.                             |
| in  | <i>GroupIDList</i>  | The sequence of group IDs the service settings are requested for. |
| out | <i>GroupSvcList</i> | Svc members and settings from these groups                        |

#### Exceptions

|                        |                                                                                                                                |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <i>OperationFailed</i> | Is thrown: <ul style="list-style-type: none"> <li>• if BoardNr is not valid</li> <li>• if a group ID does not exist</li> </ul> |
| <i>TimeOut</i>         | Is thrown when it takes too long to handle the call.                                                                           |

**Version**

Release 10.0.5

**8.26.4.11** void DCM::DeviceControl::SMX\_MFP\_SvcSettingGet\_V2 ( in unsigned short *BoardNr*, in SMX\_MFP\_GroupID\_List\_t *GroupIDList*, out SMX\_MFP\_Group\_SvcSettings\_V2\_List\_t *GroupSvcList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Retrieve the Service settings from a group.

**See also**

[SMX\\_MFP\\_SvcSettingGet\(\)](#).

This version add the possibility to enable measuring of PassThrough services.

**Parameters**

|     |                     |                                                                   |
|-----|---------------------|-------------------------------------------------------------------|
| in  | <i>BoardNr</i>      | The slot(board) to apply the call on.                             |
| in  | <i>GroupIDList</i>  | The sequence of group IDs the service settings are requested for. |
| out | <i>GroupSvcList</i> | Svc members and settings from these groups                        |

**Exceptions**

|                        |                                                                                                                                |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <i>OperationFailed</i> | Is thrown: <ul style="list-style-type: none"> <li>• if BoardNr is not valid</li> <li>• if a group ID does not exist</li> </ul> |
| <i>TimeOut</i>         | Is thrown when it takes too long to handle the call.                                                                           |

**Version**

Release 11.10

**8.26.4.12** void DCM::DeviceControl::SMX\_MFP\_TSAdd ( in unsigned short *BoardNr*, in SMX\_MFP\_Group\_TSSettings\_List\_t *GroupTSList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Add complete mux output transport stream(s) to statmux group(s).

This can only be done for statmux groups of type MultiTS or SingleTS\_AllSvc. For groups of type SingleTS\_SelectedSvc it is not possible to add TS (in this case services have to be added instead).

TS added to the group by this call will automatically add all their services to the group. When services are added/removed while a TS is member of a group then these services will automatically be added/removed to/from the group.

**Parameters**

|    |                    |                                                                             |
|----|--------------------|-----------------------------------------------------------------------------|
| in | <i>BoardNr</i>     | The slot(board) to apply the call on.                                       |
| in | <i>GroupTSList</i> | A sequence of statmux group ids / transport stream(s) that should be added. |

**Exceptions**

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OperationFailed</i> | Is thrown when: <ul style="list-style-type: none"> <li>• if BoardNr is not valid</li> <li>• if group ID does not exists</li> <li>• if transport stream does not exist</li> <li>• if the transport stream is already part of a group or this group</li> <li>• if trying to add more than one TS to a SingleTS_AllSvc group</li> <li>• if trying to add a TS to a SingleTS_SelectedSvc group</li> <li>• if trying to add a MPTS to a MultiTS group (in this case only SPTS are allowed)</li> <li>• if there are not enough internal resources anymore to add the TS to a group</li> <li>• if the reserved bitrate of the TS is set out of range</li> </ul> |
| <i>TimeOut</i>         | Is thrown when it takes too long to handle the call.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Version**

Release 10.0.5

**8.26.4.13** void DCM::DeviceControl::SMX\_MFP\_TSChange ( in unsigned short *BoardNr*, in SMX\_MFP\_Group\_TSSettings\_List\_t *GroupTSList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Change a list of TSs settings that are part of the statmux group(s).

As no TS can be added on SingleTS\_SelectedSvc groups, this call cannot be issued on such groups.

**Parameters**

|     |                    |                                          |
|-----|--------------------|------------------------------------------|
| in  | <i>BoardNr</i>     | The slot(board) to apply the call on.    |
| out | <i>GroupTSList</i> | TS members of the(se) group(s) to update |

**Exceptions**

|                        |                                                                                                                                                                                                                                                                                                       |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OperationFailed</i> | Is thrown when: <ul style="list-style-type: none"> <li>• if BoardNr is not valid</li> <li>• if a group ID does not exist.</li> <li>• if a TS ref is not member of the group.</li> <li>• if a group is of Type eSMX_SingleTS_SelectedSvc</li> <li>• if reserved bitrate is set out of range</li> </ul> |
| <i>TimeOut</i>         | Is thrown when it takes too long to handle the call.                                                                                                                                                                                                                                                  |

**Version**

Release 10.0.5

**8.26.4.14** void DCM::DeviceControl::SMX\_MFP\_TSDelete ( in unsigned short *BoardNr*, in SMX\_MFP\_Group\_TS\_List\_t *GroupTSList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Delete TS(s) from statmux group(s).

This means that every single pid from every TS specified is removed from the group.

This can not be done on groups of type eSMX\_SingleTS\_SelectedSvc. Remark that only the TS ref are used in the list to identify which TS to remove. ==> TBC: maybe it is better to pass only sequence of TSRef?

**Parameters**

|    |                    |                                                                                     |
|----|--------------------|-------------------------------------------------------------------------------------|
| in | <i>BoardNr</i>     | The slot(board) to apply the call on.                                               |
| in | <i>GroupTSList</i> | The sequence of group ID(s) - transport stream(s) relations that should be deleted. |

**Exceptions**

|                        |                                                                                                                                                                                                                                                                                |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OperationFailed</i> | Is thrown: <ul style="list-style-type: none"> <li>• if BoardNr is not valid</li> <li>• if a group ID does not exist.</li> <li>• if a TS Ref does not belong to the group where it should be deleted from</li> <li>• if a group if of type eSMX_SingleTS_SelectedSvc</li> </ul> |
| <i>TimeOut</i>         | Is thrown when it takes too long to handle the call.                                                                                                                                                                                                                           |

**Version**

Release 10.0.5

**8.26.4.15** void DCM::DeviceControl::SMX\_MFP\_TSGet ( in unsigned short *BoardNr*, in SMX\_MFP\_GroupID\_List\_t *GroupIDList*, out SMX\_MFP\_Group\_TSSettings\_List\_t *GroupTSList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Gets a list of TSs settings that are part of the statmux group(s).

As no TS can be added on SingleTS\_SelectedSvc groups, this call cannot be issued on such groups.

**Parameters**

|     |                    |                                                                    |

**8.27.2.3** typedef sequence<IPS\_OutServiceSync\_t> DCM::DeviceControl::IPS\_OutServiceSyncList\_t

Definition at line 16690 of file DCM.idl.

**8.27.2.4** typedef sequence<IPS\_OutServiceSync\_V2\_t> DCM::DeviceControl::IPS\_OutServiceSyncList\_V2\_t

Definition at line 16706 of file DCM.idl.

### 8.27.3 Function Documentation

**8.27.3.1** void DCM::DeviceControl::IPS\_OutServiceGetSyncL ( in IPS\_RefTS\_t *RefTS*, in ServiceIdList\_t *OutSidList*, out IPS\_OutServiceSyncList\_t *SyncList* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the PID sync settings.

#### Parameters

|     |                   |                                                              |
|-----|-------------------|--------------------------------------------------------------|
| in  | <i>RefTS</i>      | The TS for which to get the sync settings.                   |
| in  | <i>OutSidList</i> | The SIDs of the services for which to retrieve the settings. |
| out | <i>SyncList</i>   | A list of PID sync settings.                                 |

#### Exceptions

|                       |                                                                                                                                                                                                                                               |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When BoardNr = 0 = Main.                                                                                                                                                                                                                      |
| <i>OpNotSucceeded</i> | In case: <ul style="list-style-type: none"> <li>invalid input references are used (RefTS, OutService).</li> <li>a negative delay value was set using the newer version of the set call and this call is used to readout the value.</li> </ul> |

#### Version

Supported since release 6.0

**8.27.3.2** void DCM::DeviceControl::IPS\_OutServiceGetSyncL\_V2 ( in IPS\_RefTS\_t *RefTS*, in ServiceIdList\_t *OutSidList*, out IPS\_OutServiceSyncList\_V2\_t *SyncList* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the PID sync settings.

#### Parameters

|     |                   |                                                              |
|-----|-------------------|--------------------------------------------------------------|
| in  | <i>RefTS</i>      | The TS for which to get the sync settings.                   |
| in  | <i>OutSidList</i> | The SIDs of the services for which to retrieve the settings. |
| out | <i>SyncList</i>   | A list of PID sync settings.                                 |

**Exceptions**

|                       |                                                                                                                   |
|-----------------------|-------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When BoardNr = 0 = Main.                                                                                          |
| <i>OpNotSucceeded</i> | In case: <ul style="list-style-type: none"> <li>invalid input references are used (RefTS, OutService).</li> </ul> |

**Version**

Supported since release 8.1

**8.27.3.3** void DCM::DeviceControl::IPS\_OutServiceSetSyncL ( in IPS\_RefTS\_t *RefTS*, in IPS\_OutServiceSyncList\_t *SyncList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

Set the PID sync settings.

**Parameters**

|    |                 |                                                |
|----|-----------------|------------------------------------------------|
| in | <i>RefTS</i>    | The TS for which to set the PID sync settings. |

| <i>OpNotSupported</i> | When BoardNr = 0 = Main.                                                                                                                                                                                                                                                                 |
| <i>OpNotSucceeded</i> | In case: <ul style="list-style-type: none"><li>• invalid input references are used (RefTS, OutService).</li><li>• the delay value is not within the valid range (-1200ms ... 10s).</li><li>• the service is part of a transrating group</li><li>• the service has DPI settings</li></ul> |
| <i>LicenseError</i>   | if there are insufficient PID Sync licenses to complete the request.                                                                                                                                                                                                                     |

**Version**

Supported since release 8.1

**Note**

- : If a service is not listed in the SyncList it will not be changed.
- : Existing [IPS\\_OutPID\\_Sync\\_t](#) entries are removed if a new [IPS\\_OutServiceSync\\_t](#) is set.

## 8.28 Slate Insertion

This contains specific types, enums and methods for controlling the slate insertion part of the device.

### Classes

- struct [DCM::DeviceControl::SlateService\\_t](#)

### Typedefs

- typedef sequence< SlateService\_t > [DCM::DeviceControl::SlateServiceList\\_t](#)

### Functions

- void [DCM::DeviceControl::TR\\_SlateServiceSetL](#) (in IPS\_RefTS\_t RefTS, in SlateServiceList\_t - SlateServiceList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, License-Error)  
*Enable slate insertion.*
- void [DCM::DeviceControl::TR\\_SlateServiceGetL](#) (in IPS\_RefTS\_t RefTS, in ServiceIdList\_t OutputSidList, out SlateServiceList\_t SlateServiceList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get a list of all slate services.*
- void [DCM::DeviceControl::TR\\_SlateServiceDeleteL](#) (in IPS\_RefTS\_t RefTS, in ServiceIdList\_t - OutputSidList) raises (TimeOut, OpNotAllowed, OpNotSupported)  
*Disable slate insertion.*

### 8.28.1 Detailed Description

This contains specific types, enums and methods for controlling the slate insertion part of the device.

### 8.28.2 Typedef Documentation

#### 8.28.2.1 typedef sequence<SlateService\_t> DCM::DeviceControl::SlateServiceList\_t

Definition at line 16800 of file DCM.idl.

### 8.28.3 Function Documentation

#### 8.28.3.1 void DCM::DeviceControl::TR\_SlateServiceDeleteL ( in IPS\_RefTS\_t RefTS, in ServiceIdList\_t OutputSidList ) raises (TimeOut, OpNotAllowed, OpNotSupported)

Disable slate insertion.

### Parameters

|    |                      |                                                   |
|----|----------------------|---------------------------------------------------|
| in | <i>RefTS</i>         | The TS on which to disable slate generation.      |
| in | <i>OutputSidList</i> | The list of services to disable Slate generation. |

**Exceptions**

|                       |                         |
|-----------------------|-------------------------|
| <i>OpNotSupported</i> | When BoardNr = 0 = Main |
|-----------------------|-------------------------|

**Version**

Release 7.5

**8.28.3.2** void DCM::DeviceControl::TR\_SlateServiceGetL ( in IPS\_RefTS\_t *RefTS*, in ServiceIdList\_t *OutputSidList*, out SlateServiceList\_t *SlateServiceList* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get a list of all slate services.

**Parameters**

|     |                         |                                                                                         |
|-----|-------------------------|-----------------------------------------------------------------------------------------|
| in  | <i>RefTS</i>            | The TS of which to get the slate services.                                              |
| in  | <i>OutputSidList</i>    | A list of Service ID's to get info about. All services if empty.                        |
| out | <i>SlateServiceList</i> | The list of services that have Slate generation enabled with their corresponding ClipID |

**Exceptions**

|                       |                                                                                   |
|-----------------------|-----------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When BoardNr = 0 = Main                                                           |
| <i>OpNotSucceeded</i> | When one if the services listed in OutputSidList is not in slate generation mode. |

**Version**

Release 7.5

**8.28.3.3** void DCM::DeviceControl::TR\_SlateServiceSetL ( in IPS\_RefTS\_t *RefTS*, in SlateServiceList\_t *SlateServiceList* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

Enable slate insertion.

**Parameters**

|    |                         |                                                   |
|----|-------------------------|---------------------------------------------------|
| in | <i>RefTS</i>            | The TS on which to enable the slate generation.   |
| in | <i>SlateServiceList</i> | The list of services to set the slate generation. |

**Exceptions**

|                       |                                                                                                                                                                                                           |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When BoardNr = 0 = Main                                                                                                                                                                                   |
| <i>OpNotSucceeded</i> | In case : <ul style="list-style-type: none"> <li>the ClipID doesn't exist</li> <li>the service doesn't exist.</li> <li>The service is in a transrating group / configured for DPI / PID synced</li> </ul> |
| <i>LicenseError</i>   | if there are insufficient Slate generation licenses to complete the request.                                                                                                                              |

Release 7.5

## 8.29 Audio Leveling

This contains specific types, enums and methods for controlling the audio leveling part of the device.

### Classes

- struct [DCM::DeviceControl::TR\\_AudioLevel\\_t](#)
- struct [DCM::DeviceControl::TR\\_ServiceAudioLevel\\_t](#)

### Typedefs

- typedef sequence< TR\_AudioLevel\_t > [DCM::DeviceControl::TR\\_AudioLevelList\\_t](#)
- typedef sequence < TR\_ServiceAudioLevel\_t > [DCM::DeviceControl::TR\\_ServiceAudioLevelList\\_t](#)

### Functions

- void [DCM::DeviceControl::TR\\_AudioLevelGetL](#) (in IPS\_RefTS\_t RefTS, in ServiceIdList\_t OutputSidList, out TR\_ServiceAudioLevelList\_t AudioLevels) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get a list of all audio leveling settings.*
- void [DCM::DeviceControl::TR\\_AudioLevelSetL](#) (in IPS\_RefTS\_t RefTS, in TR\_ServiceAudioLevelList\_t AudioLevels) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)  
*Set audio leveling settings.*

#### 8.29.1 Detailed Description

This contains specific types, enums and methods for controlling the audio leveling part of the device.

#### 8.29.2 Typedef Documentation

##### 8.29.2.1 typedef sequence<TR\_AudioLevel\_t> DCM::DeviceControl::TR\_AudioLevelList\_t

Definition at line 16863 of file DCM.idl.

##### 8.29.2.2 typedef sequence<TR\_ServiceAudioLevel\_t> DCM::DeviceControl::TR\_ServiceAudioLevelList\_t

Definition at line 16870 of file DCM.idl.

#### 8.29.3 Function Documentation

##### 8.29.3.1 void DCM::DeviceControl::TR\_AudioLevelGetL ( in IPS\_RefTS\_t RefTS, in ServiceIdList\_t OutputSidList, out TR\_ServiceAudioLevelList\_t AudioLevels ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get a list of all audio leveling settings.

**Parameters**

|     |                      |                                                                  |
|-----|----------------------|------------------------------------------------------------------|
| in  | <i>RefTS</i>         | The TS of which to get the audio leveling settings               |
| in  | <i>OutputSidList</i> | A list of Service ID's to get info about. All services if empty. |
| out | <i>AudioLevels</i>   | The list of audio leveling settings                              |

**Exceptions**

|                       |                         |
|-----------------------|-------------------------|
| <i>OpNotSupported</i> | When BoardNr = 0 = Main |
|-----------------------|-------------------------|

**Version**

Release 8.5

**8.29.3.2** void DCM::DeviceControl::TR\_AudioLevelSetL ( in IPS\_RefTS\_t *RefTS*, in TR\_ServiceAudioLevelList\_t *AudioLevels* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

Set audio leveling settings.

Set an empty list to remove all existing audio leveling settings.

**Parameters**

|    |                    |                                                    |
|----|--------------------|----------------------------------------------------|
| in | <i>RefTS</i>       | The TS of which to get the audio leveling settings |
| in | <i>AudioLevels</i> | The list of new audio leveling settings            |

**Exceptions**

|                       |                         |
|-----------------------|-------------------------|
| <i>OpNotSupported</i> | When BoardNr = 0 = Main |
|-----------------------|-------------------------|

**Version**

Release 8.5

## 8.30 Pure TS Delay

This contains specific types, enums and methods for controlling the pure TS delay mode of the device.

### Classes

- struct [DCM::DeviceControl::TR\\_TsDelay\\_t](#)  
*TS Delay settings.*

### Typedefs

- typedef sequence< [TR\\_TsDelay\\_t](#) > [DCM::DeviceControl::TR\\_TsDelay\\_List\\_t](#)

### Functions

- void [DCM::DeviceControl::TR\\_TsDelaySetL](#) (in [IPS\\_Ref\\_t](#) RefPhys, in [TR\\_TsDelay\\_List\\_t](#) TsDelayList) raises (TimeOut, OpNotAllowed, OpNotSupported, OpNotSucceeded, OperationFailed)  
*Enable/Disable the TS delay mode of Loophrough TS's.*
- void [DCM::DeviceControl::TR\\_TsDelayGetL](#) (in [IPS\\_Ref\\_t](#) RefPhys, in [IPS\\_RefTS\\_List\\_t](#) TS\_List, out [TR\\_TsDelay\\_List\\_t](#) TsDelayList) raises (TimeOut, OpNotAllowed, OpNotSupported, OpNotSucceeded, OperationFailed)  
*Gets the TS delay mode of Loophrough TS's.*

#### 8.30.1 Detailed Description

This contains specific types, enums and methods for controlling the pure TS delay mode of the device.

#### 8.30.2 Typedef Documentation

##### 8.30.2.1 typedef sequence< [TR\\_TsDelay\\_t](#) > [DCM::DeviceControl::TR\\_TsDelay\\_List\\_t](#)

Definition at line 16915 of file DCM.idl.

#### 8.30.3 Function Documentation

##### 8.30.3.1 void [DCM::DeviceControl::TR\\_TsDelayGetL](#) ( in [IPS\\_Ref\\_t](#) *RefPhys*, in [IPS\\_RefTS\\_List\\_t](#) *TS\_List*, out [TR\\_TsDelay\\_List\\_t](#) *TsDelayList* ) raises (TimeOut, OpNotAllowed, OpNotSupported, OpNotSucceeded, OperationFailed)

Gets the TS delay mode of Loophrough TS's.

#### Parameters

|     |                    |                                                                                                   |
|-----|--------------------|---------------------------------------------------------------------------------------------------|
| in  | <i>RefPhys</i>     | The slot(board) and port to apply the call on. Port can be 0xFFFF (all ports) or a specific port. |
| in  | <i>TS_List</i>     | List of all Loophrough TS's we want info upon. Empty list means every Loophrough TS on the port.  |
| out | <i>TsDelayList</i> | A sequence of <a href="#">TR_TsDelay_t</a>                                                        |

**Exceptions**

|                        |                                                     |
|------------------------|-----------------------------------------------------|
| <i>TimeOut</i>         | is thrown when it takes too long to handle the call |
| <i>OperationFailed</i> | is thrown when invalid references are passed        |
| <i>OpNotSupported</i>  | When BoardNr = 0 = Main                             |

**Version**

Release 8.9

**8.30.3.2** void DCM::DeviceControl::TR\_TsDelaySetL ( in IPS\_Ref\_t *RefPhys*, in TR\_TsDelay\_List\_t *TsDelayList* ) raises (TimeOut, OpNotAllowed, OpNotSupported, OpNotSucceeded, OperationFailed)

Enable/Disable the TS delay mode of Loophrough TS's.

**Parameters**

|    |                    |                                               |
|----|--------------------|-----------------------------------------------|
| in | <i>RefPhys</i>     | The slot(board) and port to apply the call on |
| in | <i>TsDelayList</i> | A sequence of <a href="#">TR_TsDelay_t</a>    |

**Exceptions**

|                        |                                                                                                                                                                    |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>         | is thrown when it takes too long to handle the call                                                                                                                |
| <i>OperationFailed</i> | is thrown <ul style="list-style-type: none"> <li>• when the delay mode of the board is not set to TsDelay</li> <li>• when invalid references are passed</li> </ul> |
| <i>OpNotSupported</i>  | When BoardNr = 0 = Main                                                                                                                                            |

**Version**

Release 8.9

## 8.31 DPI

This contains types, enums and methods to control DPI.

### Classes

- struct `DCM::DeviceControl::DPI_ChannelName_t`  
*A spliceable channel name.*
- struct `DCM::DeviceControl::DPI_ShortChannelStatus_t`
- struct `DCM::DeviceControl::DPI_ChannelSettings_t`
- struct `DCM::DeviceControl::DPI_ChannelSettings2_t`
- struct `DCM::DeviceControl::DPI_ChannelSettings3_t`
- struct `DCM::DeviceControl::DPI_ChannelStatus_t`
- struct `DCM::DeviceControl::DPI_Time_t`  
*UTC since jan 1 1970.*
- struct `DCM::DeviceControl::DPI_CueRequest_t`
- struct `DCM::DeviceControl::DPI_SpliceRequestTime_t`  
*A splice request is supposed to arrive a few seconds in advance of the actual splice time.*
- struct `DCM::DeviceControl::DPI_SpliceRequest_t`
- struct `DCM::DeviceControl::DPI_PidCouple_t`
- struct `DCM::DeviceControl::DPI_PmtSpliceModeSetting_t`  
*Struct to set/get ePMT\_SpliceMode per channel.*
- struct `DCM::DeviceControl::ETV_Primary_Settings_t`
- struct `DCM::DeviceControl::ETV_Insertion_Settings_t`
- struct `DCM::DeviceControl::ETV_ManipulationSettings_t`
- struct `DCM::DeviceControl::ETV_Primary_Settings_V2_t`
- struct `DCM::DeviceControl::ETV_Insertion_Settings_V2_t`
- struct `DCM::DeviceControl::ETV_ManipulationSettings_V2_t`
- struct `DCM::DeviceControl::ETV_ApplicationIdent_t`
- struct `DCM::DeviceControl::ETV_EissFilter_t`
- struct `DCM::DeviceControl::ClearPidBitrates_t`
- struct `DCM::DeviceControl::AddPidsFromSplice_t`
- struct `DCM::DeviceControl::AlternateSource_t`  
*A definition of an alternate source.*
- struct `DCM::DeviceControl::AlternateSourceSettings_t`  
*All the settings concerning alternate sources for one output service.*
- struct `DCM::DeviceControl::Scte35Source_t`
- struct `DCM::DeviceControl::Scte35ToggleOutOfNetwork_t`

### Typedefs

- typedef unsigned long `DCM::DeviceControl::DPI_ModeBitmap_t`  
*DPI mode bitfield, allowing combined DPI modes.*
- typedef sequence < `DPI_ChannelName_t` > `DCM::DeviceControl::DPI_ChannelName_List_t`  
*A sequence of `DPI_ChannelName_t`.*
- typedef sequence < `DPI_ChannelSettings_t` > `DCM::DeviceControl::DPI_ChannelSettings_List_t`  
*A sequence of `DPI_ChannelSettings_t`.*

- typedef sequence < DPI\_ChannelSettings2\_t > DCM::DeviceControl::DPI\_ChannelSettings2\_List\_t  
*A sequence of [DPI\\_ChannelSettings2\\_t](#).*
- typedef sequence < DPI\_ChannelSettings3\_t > DCM::DeviceControl::DPI\_ChannelSettings3\_List\_t  
*A sequence of [DPI\\_ChannelSettings3\\_t](#).*
- typedef sequence < DPI\_ChannelStatus\_t > DCM::DeviceControl::DPI\_ChannelStatus\_List\_t  
*A sequence of [DPI\\_ChannelStatus\\_t](#).*
- typedef sequence < DPI\_PidCouple\_t > DCM::DeviceControl::DPI\_PidCoupleList\_t
- typedef sequence < DPI\_PmtSpliceModeSetting\_t > DCM::DeviceControl::DPI\_PmtSpliceModeSettingList\_t  
*A sequence of [DPI\\_PmtSpliceModeSetting\\_t](#).*
- typedef sequence < ETV\_ManipulationSettings\_t > DCM::DeviceControl::ETV\_ManipulationSettings\_List\_t  
*A sequence of [ETV\\_ManipulationSettings\\_t](#).*
- typedef sequence < ETV\_ManipulationSettings\_V2\_t > DCM::DeviceControl::ETV\_ManipulationSettings\_List\_V2\_t  
*A sequence of [ETV\\_ManipulationSettings\\_V2\\_t](#).*
- typedef sequence < octet > DCM::DeviceControl::AppInstanceId\_t
- typedef sequence < ETV\_ApplicationIdent\_t > DCM::DeviceControl::ETV\_ApplicationIdent\_List\_t
- typedef sequence < ETV\_EissFilter\_t > DCM::DeviceControl::ETV\_EissFilter\_List\_t
- typedef sequence < ClearPidBitrates\_t > DCM::DeviceControl::ClearPidBitratesList\_t  
*A sequence of [ServiceBlockCAInfo\\_t](#) entries.*
- typedef sequence < AddPidsFromSplice\_t > DCM::DeviceControl::AddPidsFromSpliceList\_t  
*A sequence of [ServiceBlockCAInfo\\_t](#) entries.*
- typedef sequence < AlternateSource\_t > DCM::DeviceControl::AlternateSourceList\_t  
*A sequence of [AlternateSource\\_t](#) entries.*
- typedef sequence < Scte35Source\_t > DCM::DeviceControl::Scte35SourceList\_t  
*A sequence of [Scte35Source\\_t](#) entries.*
- typedef sequence < Scte35ToggleOutOfNetwork\_t > DCM::DeviceControl::Scte35ToggleOutOfNetworkList\_t  
*A sequence of [Scte35ToggleOutOfNetwork\\_t](#) entries.*

## Enumerations

- enum DCM::DeviceControl::eDPI\_Mode { DCM::DeviceControl::Off, DCM::DeviceControl::Scte30, DCM::DeviceControl::Scte35, DCM::DeviceControl::Manual, DCM::DeviceControl::Scte35\_Custom, DCM::DeviceControl::Manual\_Custom, DCM::DeviceControl::Scte35\_Inserter }  
*Defines how to splice a channel.*
- enum DCM::DeviceControl::eChannelLicenseStatus { DCM::DeviceControl::ChannelLicenseStatus-Ok, DCM::DeviceControl::ChannelLicenseStatusNoDPILicense }
- enum DCM::DeviceControl::eChannelViewingStatus { DCM::DeviceControl::ChannelViewingStatus-Primary, DCM::DeviceControl::ChannelViewingStatusAd }
- enum DCM::DeviceControl::eSpliceMatchRule { DCM::DeviceControl::Match, DCM::DeviceControl::PassMain }
- enum DCM::DeviceControl::ePmtSpliceMode { DCM::DeviceControl::FollowPrimary, DCM::DeviceControl::Generated }  
*Enum indicating whether PMT should follow main or must be generated during splice.*

- enum `DCM::DeviceControl::eETV_PrimaryChannel_Mode_t` { `DCM::DeviceControl::eMainSvc-BlockETV_Pids`, `DCM::DeviceControl::eMainSvcUsePrimaryServiceETV_Pids`, `DCM::DeviceControl::eMainSvcUseOtherServiceETV_Pids`, `DCM::DeviceControl::eMainSvcUseDummyETV_Pids` }
- enum `DCM::DeviceControl::eETV_InsertionChannel_Mode_t` { `DCM::DeviceControl::eAdSvcUse-InsertionServiceETV_Pids`, `DCM::DeviceControl::eAdSvcUsePrimaryServiceETV_Pids`, `DCM::DeviceControl::eAdSvcUseOtherServiceETV_Pids`, `DCM::DeviceControl::eAdSvcUseDummyETV_Pids` }
- enum `DCM::DeviceControl::eETV_PrimaryChannel_Mode_V2_t` { `DCM::DeviceControl::eMainSvc_V2_BlockETV_Pids`, `DCM::DeviceControl::eMainSvc_V2_UsePrimaryServiceETV_Pids`, `DCM::DeviceControl::eMainSvc_V2_UseOtherServiceETV_Pids`, `DCM::DeviceControl::eMainSvc_V2_UseDummyETV_Pids`, `DCM::DeviceControl::eMainSvc_V2_MergeEISS_Pids`, `DCM::DeviceControl::eMainSvc_V2_Reserved1`, `DCM::DeviceControl::eMainSvc_V2_Reserved2`, `DCM::DeviceControl::eMainSvc_V2_Reserved3`, `DCM::DeviceControl::eMainSvc_V2_Reserved4`, `DCM::DeviceControl::eMainSvc_V2_Reserved5` }
- enum `DCM::DeviceControl::eETV_InsertionChannel_Mode_V2_t` { `DCM::DeviceControl::eAdSvc_V2_UseInsertionServiceETV_Pids`, `DCM::DeviceControl::eAdSvc_V2_UsePrimaryServiceETV_Pids`, `DCM::DeviceControl::eAdSvc_V2_UseOtherServiceETV_Pids`, `DCM::DeviceControl::eAdSvc_V2_UseDummyETV_Pids`, `DCM::DeviceControl::eAdSvc_V2_MergeEISS_Pids`, `DCM::DeviceControl::eAdSvc_V2_Reserved1`, `DCM::DeviceControl::eAdSvc_V2_Reserved2`, `DCM::DeviceControl::eAdSvc_V2_Reserved3`, `DCM::DeviceControl::eAdSvc_V2_Reserved4`, `DCM::DeviceControl::eAdSvc_V2_Reserved5` }
- enum `DCM::DeviceControl::eScte35Source` { `DCM::DeviceControl::eScte35Source_Active`, `DCM::DeviceControl::eScte35Source_Insertion`, `DCM::DeviceControl::eScte35Source_Other` }

## Functions

- void `DCM::DeviceControl::ETV_ManipulationSettings_SetL` (in `IPS_RefTS_t RefTS`, in `ETV_ManipulationSettings_List_t ETV_ManipulationSettings_List`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)  
*Apply ETV Manipulation settings to a number of output services.*
- `ETV_ManipulationSettings_List_t DCM::DeviceControl::ETV_ManipulationSettings_GetL` (in `IPS_RefTS_t RefTS`, in `ServiceIdList_t OutputSidList`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)  
*Get the current settings for ETV Manipulation.*
- void `DCM::DeviceControl::ETV_GetDefaultSettings` (in unsigned short `BoardNbr`, out boolean `ETV_PidsBlocked`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)  
*Get the default settings for ETV Manipulation.*
- void `DCM::DeviceControl::ETV_SetDefaultSettings` (in unsigned short `BoardNbr`, in boolean `ETV_PidsBlocked`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)  
*Set the default settings for ETV Manipulation.*
- void `DCM::DeviceControl::ETV_ManipulationSettings_SetL_V2` (in `IPS_RefTS_t RefTS`, in `ETV_ManipulationSettings_List_V2_t ETV_ManipulationSettings_List`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)  
*Apply ETV Manipulation settings to a number of output services.*
- `ETV_ManipulationSettings_List_V2_t DCM::DeviceControl::ETV_ManipulationSettings_GetL_V2` (in `IPS_RefTS_t RefTS`, in `ServiceIdList_t OutputSidList`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)  
*Get the current settings for ETV Manipulation.*
- void `DCM::DeviceControl::ETV_EissFilter_SetL` (in `IPS_RefTS_t RefTS`, in `ETV_EissFilter_List_t ETV_EissFilter_List`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

*Apply ETV EISS filter settings to a number of output services.*

- ETV\_EissFilter\_List\_t [DCM::DeviceControl::ETV\\_EissFilter\\_GetL](#) (in IPS\_RefTS\_t RefTS, in - ServiceIdList\_t OutputSidList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

*Get the current settings for ETV EISS filters.*

- void [DCM::DeviceControl::DPI\\_SRT\\_Set](#) (in IPS\_Ref\_t RefPhys, in DPI\_SpliceRequestTime\_t - SpliceRequestTime) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Defines the minimum time required between the reception of a splicerequest and the actual splice moment.*

- DPI\_SpliceRequestTime\_t [DCM::DeviceControl::DPI\\_SRT\\_Get](#) (in IPS\_Ref\_t RefPhys) raises (- TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the currently set minimum time required between the reception of a splicerequest and the actual splice moment.*

- void [DCM::DeviceControl::DPI\\_SpliceRequest](#) (in IPS\_Ref\_t RefPhys, in DPI\_SpliceRequest\_t - SpliceRequest) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

*Trigger a splice request in manual mode for a spliceable channel.*

- void [DCM::DeviceControl::DPI\\_ResetStatistics](#) (in unsigned short SlotNbr) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Reset the DPI Scheduler statistics.*

- void [DCM::DeviceControl::DPI\\_ChannelSetL](#) (in IPS\_Ref\_t RefPhys, in DPI\_ChannelSettings\_List\_t ChannelSettingsList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Add new splice-able channels or change the settings of existing channels.*

- void [DCM::DeviceControl::DPI\\_ChannelSetL2](#) (in IPS\_Ref\_t RefPhys, in DPI\_ChannelSettings2\_List\_t ChannelSettingsList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Add new splice-able channels or change the settings of existing channels.*

- void [DCM::DeviceControl::DPI\\_ChannelSetL3](#) (in IPS\_Ref\_t RefPhys, in DPI\_ChannelSettings3\_List\_t ChannelSettingsList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)

*Add new splice-able channels or change the settings of existing channels.*

- DPI\_ChannelSettings\_List\_t [DCM::DeviceControl::DPI\\_ChannelGetL](#) (in IPS\_Ref\_t RefPhys, in - IPS\_RefTS\_t RefTS) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get a list of all splice-able channels which are part of a specific output TS.*

- DPI\_ChannelSettings2\_List\_t [DCM::DeviceControl::DPI\\_ChannelGetL2](#) (in IPS\_Ref\_t RefPhys, in IPS\_RefTS\_t RefTS) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get a list of all splice-able channels which are part of a specific output TS.*

- DPI\_ChannelSettings3\_List\_t [DCM::DeviceControl::DPI\\_ChannelGetL3](#) (in IPS\_Ref\_t RefPhys, in IPS\_RefTS\_t RefTS) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get a list of all splice-able channels which are part of a specific output TS.*

- DPI\_ChannelStatus\_List\_t [DCM::DeviceControl::DPI\\_ChannelStatusL](#) (in IPS\_Ref\_t RefPhys, in DPI\_ChannelStatus\_List\_t ChannelStatusList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get current status information of all specified splice-able channels.*

- void [DCM::DeviceControl::DPI\\_ChannelDeleteL](#) (in IPS\_Ref\_t RefPhys, in DPI\_ChannelSettings\_List\_t ChannelSettingsList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Delete a list of splice-able channels.*

- void [DCM::DeviceControl::DPI\\_ChannelDeleteL3](#) (in IPS\_Ref\_t RefPhys, in DPI\_ChannelSettings3\_List\_t ChannelSettingsList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Delete a list of splice-able channels.*

- void [DCM::DeviceControl::DPI\\_GetSpliceCouples](#) (in IPS\_Ref\_t RefPhys, in DPI\_ChannelName\_t channel, out DPI\_PidCoupleList\_t couples) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the custom splice couples.*

- void [DCM::DeviceControl::DPI\\_SetSpliceCouples](#) (in IPS\_Ref\_t RefPhys, in DPI\_ChannelName\_t channel, in DPI\_PidCoupleList\_t couples) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Set the custom splice couples.*

- void [DCM::DeviceControl::DPI\\_PmtSpliceModeSetL](#) (in IPS\_Ref\_t RefPhys, in DPI\_PmtSpliceModeSettingList\_t lst) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Set Pmt Splice Mode for given channels.*

- void [DCM::DeviceControl::DPI\\_PmtSpliceModeGetL](#) (in IPS\_RefTS\_t RefTS, out DPI\_PmtSpliceModeSettingList\_t lst) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get Pmt Splice Mode for given TS('s).*

- void [DCM::DeviceControl::DPI\\_ClearPidBitratesSetL](#) (in IPS\_RefTS\_t RefTS, in ClearPidBitratesList\_t ClearPidBitratesList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Clear pid bitrates from the main Service if the pid is not spliced.*

- ClearPidBitratesList\_t [DCM::DeviceControl::DPI\\_ClearPidBitratesGetL](#) (in IPS\_RefTS\_t RefTS, in ServiceIdList\_t OutputSidList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the current setting for Clear Pid Bitrates.*

- void [DCM::DeviceControl::DPI\\_AddPidsFromSpliceSetL](#) (in IPS\_RefTS\_t RefTS, in AddPidsFromSpliceList\_t AddPidsFromSpliceList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Add pids from the splice if there are more pids in the splice than in the main service.*

- AddPidsFromSpliceList\_t [DCM::DeviceControl::DPI\\_AddPidsFromSpliceGetL](#) (in IPS\_RefTS\_t RefTS, in ServiceIdList\_t OutputSidList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the current setting for AddPidsFromSplice.*

- void [DCM::DeviceControl::AlternateSourcesAdd](#) (in IPS\_Service\_t SvcOut, in AlternateSourceList\_t AlternateSourceList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Add alternate source settings to an output service.*

- void [DCM::DeviceControl::AlternateSourcesGet](#) (in IPS\_Service\_t SvcOut, out AlternateSourceSettings\_t AlternateSourceSettings) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the alternate source settings for a specific output service.*

- void [DCM::DeviceControl::AlternateSourcesDelete](#) (in IPS\_Service\_t SvcOut, in AlternateSrcIdList\_t AlternateSrcIdList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Delete alternate source settings for output services.*

- void [DCM::DeviceControl::SwitchToAlternateSource](#) (in IPS\_Service\_t SvcOut, in AlternateSrcId\_t AlternateSrcId) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

*Set a specific alternate source as active.*

- void [DCM::DeviceControl::DPI\\_Scte35SourceSetL](#) (in IPS\_RefTS\_t RefTS, in Scte35SourceList\_t Scte35SourceList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Set the SCTE35 Source settings.*

- Scte35SourceList\_t [DCM::DeviceControl::DPI\\_Scte35SourceGetL](#) (in IPS\_RefTS\_t RefTS, in ServiceIdList\_t OutputSidList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the current SCTE35 Source settings.*

- void [DCM::DeviceControl::DPI\\_Scte35ToggleOutOfNetworkSetL](#) (in [IPS\\_RefTS\\_t](#) RefTS, in [Scte35ToggleOutOfNetworkList\\_t](#) Scte35ToggleOutOfNetworkList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Set the SCTE35 Toggle Out Of Network settings.*

- [Scte35ToggleOutOfNetworkList\\_t](#) [DCM::DeviceControl::DPI\\_Scte35ToggleOutOfNetworkGetL](#) (in [IPS\\_RefTS\\_t](#) RefTS, in [ServiceIdList\\_t](#) OutputSidList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the SCTE35 Toggle Out Of Network settings.*

### 8.31.1 Detailed Description

This contains types, enums and methods to control DPI.

### 8.31.2 Typedef Documentation

#### 8.31.2.1 typedef sequence<AddPidsFromSplice\_t> DCM::DeviceControl::AddPidsFromSpliceList\_t

A sequence of [ServiceBlockCAInfo\\_t](#) entries.

Definition at line 17686 of file DCM.idl.

#### 8.31.2.2 typedef sequence< AlternateSource\_t> DCM::DeviceControl::AlternateSourceList\_t

A sequence of [AlternateSource\\_t](#) entries.

Definition at line 17728 of file DCM.idl.

#### 8.31.2.3 typedef sequence<octet> DCM::DeviceControl::AppInstanceId\_t

Definition at line 17339 of file DCM.idl.

#### 8.31.2.4 typedef sequence<ClearPidBitrates\_t> DCM::DeviceControl::ClearPidBitratesList\_t

A sequence of [ServiceBlockCAInfo\\_t](#) entries.

Definition at line 17642 of file DCM.idl.

#### 8.31.2.5 typedef sequence<DPI\_ChannelName\_t> DCM::DeviceControl::DPI\_ChannelName\_List\_t

A sequence of [DPI\\_ChannelName\\_t](#).

Definition at line 16994 of file DCM.idl.

#### 8.31.2.6 typedef sequence<DPI\_ChannelSettings2\_t> DCM::DeviceControl::DPI\_ChannelSettings2\_List\_t

A sequence of [DPI\\_ChannelSettings2\\_t](#).

Definition at line 17044 of file DCM.idl.

#### 8.31.2.7 typedef sequence<DPI\_ChannelSettings3\_t> DCM::DeviceControl::DPI\_ChannelSettings3\_List\_t

A sequence of [DPI\\_ChannelSettings3\\_t](#).

Definition at line 17063 of file DCM.idl.

### 8.31.2.8 `typedef sequence<DPI_ChannelSettings_t> DCM::DeviceControl::DPI_ChannelSettings_List_t`

A sequence of [DPI\\_ChannelSettings\\_t](#).

Definition at line 17029 of file DCM.idl.

### 8.31.2.9 `typedef sequence<DPI_ChannelStatus_t> DCM::DeviceControl::DPI_ChannelStatus_List_t`

A sequence of [DPI\\_ChannelStatus\\_t](#).

Definition at line 17074 of file DCM.idl.

### 8.31.2.10 `typedef unsigned long DCM::DeviceControl::DPI_ModeBitmap_t`

DPI mode bitfield, allowing combined DPI modes.

bit0 : Off bit1 : Scte30 bit2 : Scte35 bit3 : Manual bit4 : GPI bit5 : Custom // must be used in combination with an other mode or combined mode bit6 : Scte35Inserter bit7 : OnVideoLoss // set: act on video loss, not set: ignore video loss bit8 : Seamless alternates

Definition at line 16985 of file DCM.idl.

### 8.31.2.11 `typedef sequence<DPI_PidCouple_t> DCM::DeviceControl::DPI_PidCoupleList_t`

Definition at line 17123 of file DCM.idl.

### 8.31.2.12 `typedef sequence<DPI_PmtSpliceModeSetting_t> DCM::DeviceControl::DPI_PmtSpliceModeSettingList_t`

A sequence of [DPI\\_PmtSpliceModeSetting\\_t](#).

Definition at line 17140 of file DCM.idl.

### 8.31.2.13 `typedef sequence<ETV_ApplicationIdent_t> DCM::DeviceControl::ETV_ApplicationIdent_List_t`

Definition at line 17349 of file DCM.idl.

### 8.31.2.14 `typedef sequence<ETV_EissFilter_t> DCM::DeviceControl::ETV_EissFilter_List_t`

Definition at line 17358 of file DCM.idl.

### 8.31.2.15 `typedef sequence<ETV_ManipulationSettings_t> DCM::DeviceControl::ETV_ManipulationSettings_List_t`

A sequence of [ETV\\_ManipulationSettings\\_t](#).

Definition at line 17180 of file DCM.idl.

### 8.31.2.16 `typedef sequence<ETV_ManipulationSettings_V2_t> DCM::DeviceControl::ETV_ManipulationSettings_List_V2_t`

A sequence of [ETV\\_ManipulationSettings\\_V2\\_t](#).

Definition at line 17300 of file DCM.idl.

### 8.31.2.17 `typedef sequence< Scte35Source_t > DCM::DeviceControl::Scte35SourceList_t`

A sequence of [Scte35Source\\_t](#) entries.

Definition at line 17826 of file DCM.idl.

**8.31.2.18** `typedef sequence< Scte35ToggleOutOfNetwork_t > DCM::DeviceControl::Scte35ToggleOutOfNetworkList_t`

A sequence of [Scte35ToggleOutOfNetwork\\_t](#) entries.

Definition at line 17862 of file DCM.idl.

### 8.31.3 Enumeration Type Documentation

**8.31.3.1** `enum DCM::DeviceControl::eChannelLicenseStatus`

Enumerator:

*ChannelLicenseStatusOk*

*ChannelLicenseStatusNoDPILicense* --> Unable to reserve the required DPI licenses for this channel

Definition at line 16998 of file DCM.idl.

**8.31.3.2** `enum DCM::DeviceControl::eChannelViewingStatus`

Enumerator:

*ChannelViewingStatusPrimary* Currently playing MAIN feed.

*ChannelViewingStatusAd* Currently playing some ad.

Definition at line 17004 of file DCM.idl.

**8.31.3.3** `enum DCM::DeviceControl::eDPI_Mode`

Defines how to splice a channel.

Enumerator:

*Off* --> Splice temporally disabled

*Scte30* --> Splice triggered via Scte30 from AdServer

*Scte35* --> Splice triggered via Scte35 from primary stream with automatic PID matching

*Manual* --> Splice triggered via Command from GUI or script with automatic PID matching

*Scte35\_Custom* --> Splice triggered via Scte35 from primary stream using Custom PID couples

*Manual\_Custom* --> Splice triggered via Command from GUI or script using Custom PID couples

*Scte35\_Inserter* --> Splice will result in a Scte35 message inserted in the primary feed.

Definition at line 16960 of file DCM.idl.

**8.31.3.4** `enum DCM::DeviceControl::eETV_InsertionChannel_Mode_t`

Enumerator:

*eAdSvcUseInsertionServiceETV\_Pids* Default mode : pass ETV pid from insertion service during splice.

*eAdSvcUsePrimaryServiceETV\_Pids* During splice, keep passing ETV pid from primary service.

*eAdSvcUseOtherServiceETV\_Pids* If other service is in service loss, ETV pids from Insertion will be taken.

*eAdSvcUseDummyETV\_Pids* Create placeholders in PMT for EISS and EBIF pids.

Definition at line 17158 of file DCM.idl.

#### 8.31.3.5 enum DCM::DeviceControl::eETV\_InsertionChannel\_Mode\_V2\_t

Enumerator:

*eAdSvc\_V2\_UseInsertionServiceETV\_Pids* Default mode : pass ETV pid from insertion service during splice.

*eAdSvc\_V2\_UsePrimaryServiceETV\_Pids* During splice, keep passing ETV pid from primary service.

*eAdSvc\_V2\_UseOtherServiceETV\_Pids* If other service is in service loss, ETV pids from Insertion will be taken.

*eAdSvc\_V2\_UseDummyETV\_Pids* Create placeholders in PMT for EISS and EBIF pids.

*eAdSvc\_V2\_MergeEISS\_Pids* For future use. Merge the content of the EISS of another service into the EISS of the insertion.

*eAdSvc\_V2\_Reserved1* For future use.

*eAdSvc\_V2\_Reserved2* For future use.

*eAdSvc\_V2\_Reserved3* For future use.

*eAdSvc\_V2\_Reserved4* For future use.

*eAdSvc\_V2\_Reserved5* For future use.

Definition at line 17271 of file DCM.idl.

#### 8.31.3.6 enum DCM::DeviceControl::eETV\_PrimaryChannel\_Mode\_t

Enumerator:

*eMainSvcBlockETV\_Pids* No ETV pids at output at all times.

*eMainSvcUsePrimaryServiceETV\_Pids* Default mode : pass ETV pid from primary service.

*eMainSvcUseOtherServiceETV\_Pids* Only if other service is in service loss, ETV pids from primary will be taken.

*eMainSvcUseDummyETV\_Pids* Create placeholders in PMT for EISS and EBIF pids.

Definition at line 17142 of file DCM.idl.

#### 8.31.3.7 enum DCM::DeviceControl::eETV\_PrimaryChannel\_Mode\_V2\_t

Enumerator:

*eMainSvc\_V2\_BlockETV\_Pids* No ETV pids at output at all times.

*eMainSvc\_V2\_UsePrimaryServiceETV\_Pids* Default mode : pass ETV pid from primary service.

*eMainSvc\_V2\_UseOtherServiceETV\_Pids* Only if other service is in service loss, ETV pids from primary will be taken.

*eMainSvc\_V2\_UseDummyETV\_Pids* Create placeholders in PMT for EISS and EBIF pids.

*eMainSvc\_V2\_MergeEISS\_Pids* Merge the content of the EISS of another service into the EISS of the primary service.

*eMainSvc\_V2\_Reserved1* For future use.  
*eMainSvc\_V2\_Reserved2* For future use.  
*eMainSvc\_V2\_Reserved3* For future use.  
*eMainSvc\_V2\_Reserved4* For future use.  
*eMainSvc\_V2\_Reserved5* For future use.

Definition at line 17248 of file DCM.idl.

### 8.31.3.8 enum DCM::DeviceControl::ePmtSpliceMode

Enum indicating whether PMT should follow main or must be generated during splice.

Enumerator:

*FollowPrimary* The PMT is taken from the main stream.  
*Generated* The PMT is recreated based on the components found in the inserted stream.

Definition at line 17126 of file DCM.idl.

### 8.31.3.9 enum DCM::DeviceControl::eScte35Source

Enumerator:

*eScte35Source\_Active*  
*eScte35Source\_Insertion*  
*eScte35Source\_Other*

Definition at line 17810 of file DCM.idl.

### 8.31.3.10 enum DCM::DeviceControl::eSpliceMatchRule

Enumerator:

*Match* If Main PID not specified default is to block. Match with Ad PID  
*PassMain* Pass Main PID.

Definition at line 17110 of file DCM.idl.

## 8.31.4 Function Documentation

**8.31.4.1** void DCM::DeviceControl::AlternateSourcesAdd ( in IPS\_Service\_t *SvcOut*, in AlternateSourceList\_t *AlternateSourceList* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Add alternate source settings to an output service.

Parameters

|    |                             |                                                            |
|----|-----------------------------|------------------------------------------------------------|
| in | <i>SvcOut</i>               | The output service on which the settings should be applied |
| in | <i>Alternate-SourceList</i> | the settings                                               |

**Exceptions**

|                       |                                                                                                       |
|-----------------------|-------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When BoardNr = 0 = Main board.                                                                        |
| <i>OpNotSucceeded</i> | In case <ul style="list-style-type: none"> <li>invalid input references are used (SvcOut).</li> </ul> |

**Note**

Existing alternate sources are untouched

**Version**

Release 7.1

**8.31.4.2** void DCM::DeviceControl::AlternateSourcesDelete ( in IPS\_Service\_t *SvcOut*, in AlternateSrcIdList\_t *AlternateSrcIdList* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Delete alternate source settings for output services.

**Parameters**

|    |                           |                                                                                                                                                                                                 |
|----|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>SvcOut</i>             | The SvcOut on which the settings should be applied                                                                                                                                              |
| in | <i>AlternateSrcIdList</i> | A list of IDs of alternate sources that should be deleted. If empty, then all alternate sources for this Output Service will be deleted, except for the Main, the Active and the Insertion Svc. |

**Exceptions**

|                       |                                                                                                                                                                                                                                                                      |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When BoardNr = 0 = Main board.                                                                                                                                                                                                                                       |
| <i>OpNotSucceeded</i> | In case <ul style="list-style-type: none"> <li>invalid input references are used (SvcOut)</li> <li>the main source is requested for deletion</li> <li>the active source is requested for deletion</li> <li>the insertion source is requested for deletion</li> </ul> |

**Version**

Release 7.1

**8.31.4.3** void DCM::DeviceControl::AlternateSourcesGet ( in IPS\_Service\_t *SvcOut*, out AlternateSourceSettings\_t *AlternateSourceSettings* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the alternate source settings for a specific output service.

All alternate sources will be returned. Also the main source and a possible alternate source

**Parameters**

|     |                                 |                                                    |
|-----|---------------------------------|----------------------------------------------------|
| in  | <i>SvcOut</i>                   | The output service of which settings are requested |
| out | <i>Alternate-SourceSettings</i> | the settings                                       |

**Exceptions**

|                       |                                                     |
|-----------------------|-----------------------------------------------------|
| <i>OpNotSupported</i> | When BoardNr = 0 = Main board.                      |
| <i>OpNotSucceeded</i> | In case invalid input references are used (SvcOut). |

**Version**

Release 7.1

**8.31.4.4** `AddPidsFromSpliceList_t DCM::DeviceControl::DPI_AddPidsFromSpliceGetL ( in IPS_RefTS_t RefTS, in ServiceIdList_t OutputSidList )` raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the current setting for AddPidsFromSplice.

**Parameters**

|    |                      |                                                                                          |
|----|----------------------|------------------------------------------------------------------------------------------|
| in | <i>RefTS</i>         | A BoardNr, PortNr and Ref specifying the TS.                                             |
| in | <i>OutputSidList</i> | A list of Service ID's to get info about. If empty, info about all services is returned. |

**Returns**

List of [AddPidsFromSplice\\_t](#) entries

**Exceptions**

|                       |                                    |
|-----------------------|------------------------------------|
| <i>OpNotSupported</i> | When BoardNumber = 0 = Main board. |
| <i>OpNotSucceeded</i> | invalid board/port.                |

**Version**

Release 6.9

**8.31.4.5** `void DCM::DeviceControl::DPI_AddPidsFromSpliceSetL ( in IPS_RefTS_t RefTS, in AddPidsFromSpliceList_t AddPidsFromSpliceList )` raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Add pids from the splice if there are more pids in the splice than in the main service.

**Parameters**

|    |                               |                                                                                      |
|----|-------------------------------|--------------------------------------------------------------------------------------|
| in | <i>RefTS</i>                  | A BoardNr, PortNr and Ref specifying the TS.                                         |
| in | <i>AddPidsFrom-SpliceList</i> | A list of <a href="#">AddPidsFromSplice_t</a> with the option to set on each service |

## Exceptions

|                       |                                                                                                                                                |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When BoardNumber = 0 = Main board.                                                                                                             |
| <i>OpNotSucceeded</i> | <ul style="list-style-type: none"> <li>• invalid board/port.</li> <li>• When trying to set on a seamless alternates output service.</li> </ul> |

## Version

Release 6.9

**8.31.4.6** void DCM::DeviceControl::DPI\_ChannelDeleteL ( in IPS\_Ref\_t *RefPhys*, in DPI\_ChannelSettings\_List\_t *ChannelSettingsList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Delete a list of splice-able channels.

## Parameters

|    |                             |                                           |
|----|-----------------------------|-------------------------------------------|
| in | <i>RefPhys</i>              | The Slot (and Port) to apply the call on. |
| in | <i>Channel-SettingsList</i> | Defines a list of splice-able channels.   |

## Exceptions

|                       |                                    |
|-----------------------|------------------------------------|
| <i>OpNotSupported</i> | When BoardNumber = 0 = Main board. |
|-----------------------|------------------------------------|

**8.31.4.7** void DCM::DeviceControl::DPI\_ChannelDeleteL3 ( in IPS\_Ref\_t *RefPhys*, in DPI\_ChannelSettings3\_List\_t *ChannelSettingsList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotOut, OpNotSupported)

Delete a list of splice-able channels.

## Parameters

|    |                             |                                           |
|----|-----------------------------|-------------------------------------------|
| in | <i>RefPhys</i>              | The Slot (and Port) to apply the call on. |
| in | <i>Channel-SettingsList</i> | Defines a list of splice-able channels.   |

## Exceptions

|                       |                                    |
|-----------------------|------------------------------------|
| <i>OpNotSupported</i> | When BoardNumber = 0 = Main board. |
|-----------------------|------------------------------------|

**8.31.4.8** DPI\_ChannelSettings\_List\_t DCM::DeviceControl::DPI\_ChannelGetL ( in IPS\_Ref\_t *RefPhys*, in IPS\_RefTS\_t *RefTS* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get a list of all splice-able channels which are part of a specific output TS.

**Parameters**

|    |                |                                            |
|----|----------------|--------------------------------------------|
| in | <i>RefPhys</i> | The Slot (and Port) to apply the call on.  |
| in | <i>RefTS</i>   | The Slot, Port and Index of the output TS. |

**Returns**

DPI\_ChannelSettings\_List\_t: List of settings of splice-able channels.

**Exceptions**

|                       |                                                                                                              |
|-----------------------|--------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | <ul style="list-style-type: none"> <li>When BoardNumber = 0 = Main board.</li> </ul>                         |
| <i>OpNotSucceeded</i> | <ul style="list-style-type: none"> <li>When the TS contains a seamless alternates output service.</li> </ul> |

**Note**

An incorrect RefTS will lead to an empty list being returned.

#### 8.31.4.9 DPI\_ChannelSettings2\_List\_t DCM::DeviceControl::DPI\_ChannelGetL2 ( in IPS\_Ref\_t *RefPhys*, in IPS\_RefTS\_t *RefTS* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get a list of all splice-able channels which are part of a specific output TS.

This call includes channel status fields.

**Parameters**

|    |                |                                            |
|----|----------------|--------------------------------------------|
| in | <i>RefPhys</i> | The Slot (and Port) to apply the call on.  |
| in | <i>RefTS</i>   | The Slot, Port and Index of the output TS. |

**Returns**

DPI\_ChannelSettings\_List2\_t: List of settings of splice-able channels.

**Exceptions**

|                       |                                                                                                              |
|-----------------------|--------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | <ul style="list-style-type: none"> <li>When BoardNumber = 0 = Main board.</li> </ul>                         |
| <i>OpNotSucceeded</i> | <ul style="list-style-type: none"> <li>When the TS contains a seamless alternates output service.</li> </ul> |

**Note**

An incorrect RefTS will lead to an empty list being returned.

RefTS == 0xFFFFFFFF will return ALL splice-able channels on the board (R2.5 and higher only).

**8.31.4.10** `DPI_ChannelSettings3_List_t DCM::DeviceControl::DPI_ChannelGetL3 ( in IPS_Ref_t RefPhys, in IPS_RefTS_t RefTS )` raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get a list of all splice-able channels which are part of a specific output TS.

This call includes channel status fields.

#### Parameters

|    |                |                                            |
|----|----------------|--------------------------------------------|
| in | <i>RefPhys</i> | The Slot (and Port) to apply the call on.  |
| in | <i>RefTS</i>   | The Slot, Port and Index of the output TS. |

#### Returns

`DPI_ChannelSettings_List3_t`: List of settings of splice-able channels.

#### Exceptions

|                       |                                    |
|-----------------------|------------------------------------|
| <i>OpNotSupported</i> | When BoardNumber = 0 = Main board. |
|-----------------------|------------------------------------|

#### Note

An incorrect RefTS will lead to an empty list being returned.

RefTS == 0xFFFFFFFF will return ALL splice-able channels on the board (R2.5 and higher only).

**8.31.4.11** `void DCM::DeviceControl::DPI_ChannelSetL ( in IPS_Ref_t RefPhys, in DPI_ChannelSettings_List_t ChannelSettingsList )` raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Add new splice-able channels or change the settings of existing channels.

#### Parameters

|    |                            |                                                             |
|----|----------------------------|-------------------------------------------------------------|
| in | <i>RefPhys</i>             | The Slot (and Port) to apply the call on.                   |
| in | <i>ChannelSettingsList</i> | Defines a list of splice-able channels with their settings. |

#### Exceptions

|                       |                                                                                                                                                                    |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When BoardNumber = 0 = Main board.                                                                                                                                 |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>Invalid references (PrimaryTS refers to a stream not available on the output, non-existing mode,...).</li> </ul> |

**8.31.4.12** `void DCM::DeviceControl::DPI_ChannelSetL2 ( in IPS_Ref_t RefPhys, in DPI_ChannelSettings2_List_t ChannelSettingsList )` raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Add new splice-able channels or change the settings of existing channels.

This call includes channel status fields.

**Parameters**

|    |                             |                                                             |
|----|-----------------------------|-------------------------------------------------------------|
| in | <i>RefPhys</i>              | The Slot (and Port) to apply the call on.                   |
| in | <i>Channel-SettingsList</i> | Defines a list of splice-able channels with their settings. |

**Exceptions**

|                       |                                                                                                                                                                    |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When BoardNumber = 0 = Main board.                                                                                                                                 |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>Invalid references (PrimaryTS refers to a stream not available on the output, non-existing mode,...).</li> </ul> |

**8.31.4.13** void DCM::DeviceControl::DPI\_ChannelSetL3 ( in IPS\_Ref\_t *RefPhys*, in DPI\_ChannelSettings3\_List\_t *ChannelSettingsList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)

Add new splice-able channels or change the settings of existing channels.

This call includes channel status fields.

**Parameters**

|    |                             |                                                             |
|----|-----------------------------|-------------------------------------------------------------|
| in | <i>RefPhys</i>              | The Slot (and Port) to apply the call on.                   |
| in | <i>Channel-SettingsList</i> | Defines a list of splice-able channels with their settings. |

**Exceptions**

|                       |                                                                                                                                                                    |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When BoardNumber = 0 = Main board.                                                                                                                                 |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>Invalid references (PrimaryTS refers to a stream not available on the output, non-existing mode,...).</li> </ul> |
| <i>OutOfRange</i>     | In case of <ul style="list-style-type: none"> <li>Invalid SpliceDelay</li> </ul>                                                                                   |

**8.31.4.14** DPI\_ChannelStatus\_List\_t DCM::DeviceControl::DPI\_ChannelStatusL ( in IPS\_Ref\_t *RefPhys*, in DPI\_ChannelStatus\_List\_t *ChannelStatusList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get current status information of all specified splice-able channels.

**Parameters**

|    |                           |                                           |
|----|---------------------------|-------------------------------------------|
| in | <i>RefPhys</i>            | The Slot (and Port) to apply the call on. |
| in | <i>ChannelStatus-List</i> | Defines a list of splice-able channels.   |

**Returns**

DPI\_ChannelStatus\_List\_t: Status info of splice-able channels.

**Exceptions**

|                       |                                    |
|-----------------------|------------------------------------|
| <i>OpNotSupported</i> | When BoardNumber = 0 = Main board. |
|-----------------------|------------------------------------|

**Note**

An incorrect RefTS will lead to an empty list being returned.

RefTS == 0xFFFFFFFF will return ALL splice-able channels on the board (R2.5 and higher only).

**8.31.4.15** `ClearPidBitratesList_t DCM::DeviceControl::DPI_ClearPidBitratesGetL ( in IPS_RefTS_t RefTS, in ServiceIdList_t OutputSidList )` raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the current setting for Clear Pid Bitrates.

**Parameters**

|    |                      |                                                                                          |
|----|----------------------|------------------------------------------------------------------------------------------|
| in | <i>RefTS</i>         | A BoardNr, PortNr and Ref specifying the TS.                                             |
| in | <i>OutputSidList</i> | A list of Service ID's to get info about. If empty, info about all services is returned. |

**Returns**

List of [ClearPidBitrates\\_t](#) entries

**Exceptions**

|                       |                                    |
|-----------------------|------------------------------------|
| <i>OpNotSupported</i> | When BoardNumber = 0 = Main board. |
| <i>OpNotSucceeded</i> | invalid board/port.                |

**Version**

Release 6.9

**8.31.4.16** `void DCM::DeviceControl::DPI_ClearPidBitratesSetL ( in IPS_RefTS_t RefTS, in ClearPidBitratesList_t ClearPidBitratesList )` raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Clear pid bitrates from the main Service if the pid is not spliced.

It is possible the the main service has more pids then the service it is spliced with. If this feature is enabled, then the bitrate of these extra pids will be set to zero during the splice.

**Parameters**

|    |                              |                                                                                     |
|----|------------------------------|-------------------------------------------------------------------------------------|
| in | <i>RefTS</i>                 | A BoardNr, PortNr and Ref specifying the TS.                                        |
| in | <i>ClearPid-BitratesList</i> | A list of <a href="#">ClearPidBitrates_t</a> with the option to set on each service |

**Exceptions**

|                       |                                                                                                                                                |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When BoardNumber = 0 = Main board.                                                                                                             |
| <i>OpNotSucceeded</i> | <ul style="list-style-type: none"> <li>• invalid board/port.</li> <li>• when trying to set on a seamless alternates output service.</li> </ul> |

**Version**

Release 6.9

**8.31.4.17** void DCM::DeviceControl::DPI\_GetSpliceCouples ( in IPS\_Ref\_t *RefPhys*, in DPI\_ChannelName\_t *channel*, out DPI\_PidCoupleList\_t *couples* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the custom splice couples.

**Parameters**

|     |                |                                         |
|-----|----------------|-----------------------------------------|
| in  | <i>RefPhys</i> | The board to apply the call on          |
| in  | <i>channel</i> | The channelname to get the couples from |
| out | <i>couples</i> | The list of couples                     |

**Exceptions**

|                       |                                                                      |
|-----------------------|----------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | invalid board/port, channelname doesn't exist or has non-custom mode |
|-----------------------|----------------------------------------------------------------------|

**8.31.4.18** void DCM::DeviceControl::DPI\_PmtSpliceModeGetL ( in IPS\_RefTS\_t *RefTS*, out DPI\_PmtSpliceModeSettingList\_t *lst* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get Pmt Splice Mode for given TS('s).

**Parameters**

|     |              |                                                                  |
|-----|--------------|------------------------------------------------------------------|
| in  | <i>RefTS</i> | Indicates the board, port, TS (the latter two allow wild cards). |
| out | <i>lst</i>   |                                                                  |

**Exceptions**

|                       |                                    |
|-----------------------|------------------------------------|
| <i>OpNotSupported</i> | When BoardNumber = 0 = Main board. |
| <i>OpNotSucceeded</i> | invalid board/port.                |

**8.31.4.19** void DCM::DeviceControl::DPI\_PmtSpliceModeSetL ( in IPS\_Ref\_t *RefPhys*, in DPI\_PmtSpliceModeSettingList\_t *lst* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set Pmt Splice Mode for given channels.

**Parameters**

|    |                |                                                                   |
|----|----------------|-------------------------------------------------------------------|
| in | <i>RefPhys</i> | Indicates the board the channel(s) sit on. (The port is ignored.) |
| in | <i>lst</i>     |                                                                   |

**Exceptions**

|                       |                                                                                                                                                                                                                             |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When BoardNumber = 0 = Main board.                                                                                                                                                                                          |
| <i>OpNotSucceeded</i> | <ul style="list-style-type: none"> <li>invalid board.</li> <li>channelname doesn't exist.</li> <li>try to set Generated when in 30/35 mode.</li> <li>when trying to call on a seamless alternates output service</li> </ul> |

**Remarks**

A channel that is switched to 30/35 mode through [DPI\\_ChannelSetL\(\)](#) is set to FollowPrimary automatically.

#### 8.31.4.20 void DCM::DeviceControl::DPI\_ResetStatistics ( in unsigned short *SlotNbr* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Reset the DPI Scheduler statistics.

**Parameters**

|    |                |                                                          |
|----|----------------|----------------------------------------------------------|
| in | <i>SlotNbr</i> | The slot number on which the statistics should be reset. |
|----|----------------|----------------------------------------------------------|

**Exceptions**

|                       |                                                                                                                  |
|-----------------------|------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When BoardNumber = 0 = Main board.                                                                               |
| <i>OpNotSucceeded</i> | When particular slot does not support splicing. <ul style="list-style-type: none"> <li>invalid board.</li> </ul> |

**Version**

Release 11.10

#### 8.31.4.21 Scte35SourceList\_t DCM::DeviceControl::DPI\_Scte35SourceGetL ( in IPS\_RefTS\_t *RefTS*, in ServiceIdList\_t *OutputSidList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the current SCTE35 Source settings.

**Parameters**

|    |                      |                                                                                          |
|----|----------------------|------------------------------------------------------------------------------------------|
| in | <i>RefTS</i>         | A BoardNr, PortNr and Ref specifying the TS.                                             |
| in | <i>OutputSidList</i> | A list of Service ID's to get info about. If empty, info about all services is returned. |

**Returns**

List of `Scte35OutOfNetworkList_t` entries

**Exceptions**

|                       |                                    |
|-----------------------|------------------------------------|
| <i>OpNotSupported</i> | When BoardNumber = 0 = Main board. |
| <i>OpNotSucceeded</i> | invalid board/port.                |

| in | <i>couples</i> | The couples to set.                     |

**Exceptions**

|                       |                                                                                                                                                                                                                                                                                           |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When BoardNumber = 0 = Main board.                                                                                                                                                                                                                                                        |
| <i>OpNotSucceeded</i> | <ul style="list-style-type: none"> <li>• invalid board/port</li> <li>• channelname doesn't exist or has non-custom mode</li> <li>• couples specify a Main PID twice</li> <li>• Ad PID entered for PassMain rule</li> <li>• When trying to set on a seamless alternates channel</li> </ul> |

**8.31.4.26** void DCM::DeviceControl::DPI\_SpliceRequest ( in IPS\_Ref\_t *RefPhys*, in DPI\_SpliceRequest\_t *SpliceRequest* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

Trigger a splice request in manual mode for a spliceable channel.

**Parameters**

|    |                      |                                                                 |
|----|----------------------|-----------------------------------------------------------------|
| in | <i>RefPhys</i>       | The Slot (and Port) to apply the call on.                       |
| in | <i>SpliceRequest</i> | Defines which channel should be spliced, when and for how long. |

**Exceptions**

|                       |                                                                                                                                                                       |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When BoardNumber = 0 = Main board.                                                                                                                                    |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>• Invalid references (Channelname does not exist on this board).</li> <li>• Channel not in manual mode.</li> </ul>  |
| <i>LicenseError</i>   | In case of <ul style="list-style-type: none"> <li>• No licenses available (for a splice-in request, splice-out is accepted even when no license available)</li> </ul> |

**8.31.4.27** DPI\_SpliceRequestTime\_t DCM::DeviceControl::DPI\_SRT\_Get ( in IPS\_Ref\_t *RefPhys* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the currently set minimum time required between the reception of a splicerequest and the actual splice moment.

**Parameters**

|    |                |                                           |
|----|----------------|-------------------------------------------|
| in | <i>RefPhys</i> | The Slot (and Port) to apply the call on. |
|----|----------------|-------------------------------------------|

**Returns**

SpliceRequestTime: Contains the minimum time.

**Exceptions**

|                       |                                    |
|-----------------------|------------------------------------|
| <i>OpNotSupported</i> | When BoardNumber = 0 = Main board. |
|-----------------------|------------------------------------|

**Deprecated** Obsoleted in release 11.0

**8.31.4.28** void DCM::DeviceControl::DPI\_SRT\_Set ( in IPS\_Ref\_t *RefPhys*, in DPI\_SpliceRequestTime\_t *SpliceRequestTime* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Defines the minimum time required between the reception of a splicerequest and the actual splice moment.

#### Parameters

|    |                          |                                           |
|----|--------------------------|-------------------------------------------|
| in | <i>RefPhys</i>           | The Slot (and Port) to apply the call on. |
| in | <i>SpliceRequestTime</i> | Defines the minimum time.                 |

#### Exceptions

|                       |                                    |
|-----------------------|------------------------------------|
| <i>OpNotSupported</i> | When BoardNumber = 0 = Main board. |
|-----------------------|------------------------------------|

**Deprecated** Obsoleted in release 11.0

**8.31.4.29** ETV\_EissFilter\_List\_t DCM::DeviceControl::ETV\_EissFilter\_GetL ( in IPS\_RefTS\_t *RefTS*, in ServiceIdList\_t *OutputSidList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Get the current settings for ETV EISS filters.

#### Parameters

|    |                      |                                                                                          |
|----|----------------------|------------------------------------------------------------------------------------------|
| in | <i>RefTS</i>         | A BoardNr, PortNr and Ref specifying the TS.                                             |
| in | <i>OutputSidList</i> | A list of Service ID's to get info about. If empty, info about all services is returned. |

#### Returns

List of ETV\_EissFilter\_List\_t entries

#### Exceptions

|                        |                                    |
|------------------------|------------------------------------|
| <i>OpNotSupported</i>  | When BoardNumber = 0 = Main board. |
| <i>OperationFailed</i> | invalid board/port.                |

#### Version

Release 10.0

**8.31.4.30** void DCM::DeviceControl::ETV\_EissFilter\_SetL ( in IPS\_RefTS\_t *RefTS*, in ETV\_EissFilter\_List\_t *ETV\_EissFilter\_List* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Apply ETV EISS filter settings to a number of output services.

**Parameters**

|    |                             |                                                                            |
|----|-----------------------------|----------------------------------------------------------------------------|
| in | <i>RefTS</i>                | A BoardNr, PortNr and Ref specifying the TS.                               |
| in | <i>ETV_Eiss-Filter_List</i> | A list of <a href="#">ETV_EissFilter_t</a> with filter options per service |

**Exceptions**

|                        |                                                                                                                                     |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i>  | When BoardNumber = 0 = Main board.                                                                                                  |
| <i>OperationFailed</i> | <ul style="list-style-type: none"> <li>• invalid board/port.</li> <li>• when invalid combination of parameters are used.</li> </ul> |

**Version**

Release 10.10

**8.31.4.31** void DCM::DeviceControl::ETV\_GetDefaultSettings ( in unsigned short *BoardNbr*, out boolean *ETV\_PidsBlocked* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Get the default settings for ETV Manipulation.

**Parameters**

|     |                        |                                                                          |
|-----|------------------------|--------------------------------------------------------------------------|
| in  | <i>BoardNbr</i>        | Board number where the default will be retrieved from.                   |
| out | <i>ETV_PidsBlocked</i> | Indicates whether ETV pids are blocked by default (true) or not (false). |

**Returns****Exceptions**

|                       |                                    |
|-----------------------|------------------------------------|
| <i>OpNotSupported</i> | When BoardNumber = 0 = Main board. |
|-----------------------|------------------------------------|

**Version**

Release 9.0

**8.31.4.32** ETV\_ManipulationSettings\_List\_t DCM::DeviceControl::ETV\_ManipulationSettings\_GetL ( in IPS\_RefTS\_t *RefTS*, in ServiceIdList\_t *OutputSidList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Get the current settings for ETV Manipulation.

**Parameters**

|    |                      |                                                                                          |
|----|----------------------|------------------------------------------------------------------------------------------|
| in | <i>RefTS</i>         | A BoardNr, PortNr and Ref specifying the TS.                                             |
| in | <i>OutputSidList</i> | A list of Service ID's to get info about. If empty, info about all services is returned. |

**Returns**

List of [ETV\\_ManipulationSettings\\_t](#) entries

**Exceptions**

|                        |                                    |
|------------------------|------------------------------------|
| <i>OpNotSupported</i>  | When BoardNumber = 0 = Main board. |
| <i>OperationFailed</i> | invalid board/port.                |

**Version**

Release 9.0

**8.31.4.33** `ETV_ManipulationSettings_List_V2_t DCM::DeviceControl::ETV_ManipulationSettings_GetL_V2 ( in IPS_RefTS_t RefTS, in ServiceIdList_t OutputSidList )` raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Get the current settings for ETV Manipulation.

**Parameters**

|    |                      |                                                                                          |
|----|----------------------|------------------------------------------------------------------------------------------|
| in | <i>RefTS</i>         | A BoardNr, PortNr and Ref specifying the TS.                                             |
| in | <i>OutputSidList</i> | A list of Service ID's to get info about. If empty, info about all services is returned. |

**Returns**

List of [ETV\\_ManipulationSettings\\_V2\\_t](#) entries

**Exceptions**

|                        |                                    |
|------------------------|------------------------------------|
| <i>OpNotSupported</i>  | When BoardNumber = 0 = Main board. |
| <i>OperationFailed</i> | invalid board/port.                |

**Version**

Release 10.0

**8.31.4.34** `void DCM::DeviceControl::ETV_ManipulationSettings_SetL ( in IPS_RefTS_t RefTS, in ETV_ManipulationSettings_List_t ETV_ManipulationSettings_List )` raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Apply ETV Manipulation settings to a number of output services.

ETV Manipulation can only be enabled if DPI mode is SCTE30.

**Parameters**

|    |                                      |                                                                                                |
|----|--------------------------------------|------------------------------------------------------------------------------------------------|
| in | <i>RefTS</i>                         | A BoardNr, PortNr and Ref specifying the TS.                                                   |
| in | <i>ETV_ManipulationSettings_List</i> | A list of <a href="#">ETV_ManipulationSettings_t</a> with the option to enable on each service |

**Exceptions**

|                        |                                                                                                                                                                    |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i>  | When BoardNumber = 0 = Main board.                                                                                                                                 |
| <i>OperationFailed</i> | <ul style="list-style-type: none"> <li>• invalid board/port.</li> <li>• when trying to enable on an output service where DPI mode is not set to SCTE30.</li> </ul> |

**Version**

Release 9.0

**8.31.4.35** void DCM::DeviceControl::ETV\_ManipulationSettings\_SetL\_V2 ( in IPS\_RefTS\_t *RefTS*, in ETV\_ManipulationSettings\_List\_V2\_t *ETV\_ManipulationSettings\_List* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Apply ETV Manipulation settings to a number of output services.

ETV Manipulation can only be enabled if DPI mode is SCTE30.

**Parameters**

|    |                                      |                                                                                                   |
|----|--------------------------------------|---------------------------------------------------------------------------------------------------|
| in | <i>RefTS</i>                         | A BoardNr, PortNr and Ref specifying the TS.                                                      |
| in | <i>ETV_ManipulationSettings_List</i> | A list of <a href="#">ETV_ManipulationSettings_V2_t</a> with the option to enable on each service |

**Exceptions**

|                        |                                                                                                                                                                                                                                |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i>  | When BoardNumber = 0 = Main board.                                                                                                                                                                                             |
| <i>OperationFailed</i> | <ul style="list-style-type: none"> <li>• invalid board/port.</li> <li>• when trying to enable on an output service where DPI mode is not set to SCTE30.</li> <li>• when invalid combination of parameters are used.</li> </ul> |

**Version**

Release 10.0

**8.31.4.36** void DCM::DeviceControl::ETV\_SetDefaultSettings ( in unsigned short *BoardNbr*, in boolean *ETV\_PidsBlocked* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Set the default settings for ETV Manipulation.

**Parameters**

|    |                        |                                                                                |
|----|------------------------|--------------------------------------------------------------------------------|
| in | <i>BoardNbr</i>        | Board number where the default shall be set.                                   |
| in | <i>ETV_PidsBlocked</i> | Indicates whether ETV pids should be blocked by default (true) or not (false). |

**Returns****Exceptions**

|                       |                                    |
|-----------------------|------------------------------------|
| <i>OpNotSupported</i> | When BoardNumber = 0 = Main board. |
|-----------------------|------------------------------------|

**Version**

Release 9.0

**8.31.4.37** void DCM::DeviceControl::SwitchToAlternateSource ( in IPS\_Service\_t *SvcOut*, in AlternateSrcId\_t *AlternateSrcId* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

Set a specific alternate source as active.

**Parameters**

|    |                       |                                                          |
|----|-----------------------|----------------------------------------------------------|
| in | <i>SvcOut</i>         | The output service where the alternate source is located |
| in | <i>AlternateSrcId</i> | The ID of the alternate source that must be activated    |

**Exceptions**

|                       |                                                                                                                                      |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When BoardNr = 0 = Main board.                                                                                                       |
| <i>OpNotSucceeded</i> | In case <ul style="list-style-type: none"> <li>• The SvcOut is invalid</li> <li>• the alternate source ID is not existing</li> </ul> |
| <i>LicenseError</i>   | for a seamless alternate output service that has no license.                                                                         |

**Version**

Release 7.1

## 8.32 GBE

This group contains modules specific for GbE boards.

Collaboration diagram for GBE:

## Classes

- struct [DCM::DeviceControl::PortFilter\\_t](#)

## Modules

- [RTP](#)  
*This module contains types, enums and methods related to RTP (Real-Time Protocol).*
- [VLAN](#)  
*This module contains types, enums and methods related to VLAN (Virtual LAN).*
- [TOS](#)  
*This module contains types, enums and methods related to TOS (Type of Service).*
- [Source Ip/Udp](#)  
*This module contains types, enums and methods related to set the source ip and or udp port of an outgoing transport stream.*
- [TTL](#)  
*This module contains types, enums and methods related to TTL (*Time* to live).*
- [VBR](#)  
*This module contains types, enums and methods related to VBR (Variable Bitrate).*
- [UDP Size](#)  
*This module contains types and methods related to UDP Size.*
- [ARP](#)  
*This module contains types, enums and methods related to ARP.*
- [ROUTE](#)  
*This module contains types, enums and methods related to routing.*
- [END\\_DEVICE](#)  
*This module contains types, enums and methods related to end devices.*
- [FEC](#)  
*This contains types, enums and methods to configure the FEC streams of the device.*
- [Statistics](#)  
*This module contains types, enums and methods related to statistics gathering.*

## Enumerations

- enum [DCM::DeviceControl::ePortFilterType](#) { [DCM::DeviceControl::ePortFilter\\_PPC](#), [DCM::DeviceControl::ePortFilter\\_MPEG](#) }
- enum [DCM::DeviceControl::ePortFilterMode](#) { [DCM::DeviceControl::ePortFilter\\_Disabled](#), [DCM::DeviceControl::ePortFilter\\_MacOnly](#), [DCM::DeviceControl::ePortFilter\\_IpOnly](#), [DCM::DeviceControl::ePortFilter\\_MacIp](#) }

## Functions

- void [DCM::DeviceControl::IPS\\_GBE\\_UdpBndrySet](#) (in [IPS\\_Ref\\_t](#) RefPhys, in unsigned short UDP\_Boundary) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)  
*Specifies the range of UDP ports for which traffic will be sent to the CPU instead of being processed by the firmware.*
- void [DCM::DeviceControl::IPS\\_GBE\\_UdpBndryGet](#) (in [IPS\\_Ref\\_t](#) RefPhys, out unsigned short UDP\_Boundary) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Query the board-specific UDP threshold.*

- void **DCM::DeviceControl::IPS\_GBE\_FilterSet** (in IPS\_Ref\_t RefPhys, in PortFilter\_t PortFilter) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Set the PPC/MPEG filter settings of a GBE port.*

- void **DCM::DeviceControl::IPS\_GBE\_FilterGet** (in IPS\_Ref\_t RefPhys, in ePortFilterType Type, out PortFilter\_t PortFilter) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the PPC/MPEG filter settings of a GBE port.*

- void **DCM::DeviceControl::PassPacketsWithCRC\_Error\_Set** (in unsigned short BoardNr, in boolean bPass) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Drop or pass IP input packets with CRC error.*

- void **DCM::DeviceControl::PassPacketsWithCRC\_Error\_Get** (in unsigned short BoardNr, out boolean bPass) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Query if IP input packets with CRC error are being passed or dropped.*

### 8.32.1 Detailed Description

This group contains modules specific for GbE boards.

### 8.32.2 Enumeration Type Documentation

#### 8.32.2.1 enum DCM::DeviceControl::ePortFilterMode

Enumerator:

**ePortFilter\_Disabled** No filtering is done, all received packets will be processed for the selected GBE port.

**ePortFilter\_MacOnly** Packets are filtered on MAC address only.

**ePortFilter\_IpOnly** Packets are filtered on IP address only.

**ePortFilter\_MacIp** Packets are filtered on MAC and IP address.

Definition at line 18528 of file DCM.idl.

#### 8.32.2.2 enum DCM::DeviceControl::ePortFilterType

Enumerator:

**ePortFilter\_PPC** PPC protocol stack packet filter.

**ePortFilter\_MPEG** MPEG packet filter.

Definition at line 18522 of file DCM.idl.

### 8.32.3 Function Documentation

- 8.32.3.1 void **DCM::DeviceControl::IPS\_GBE\_FilterGet** ( in IPS\_Ref\_t *RefPhys*, in ePortFilterType *Type*, out PortFilter\_t *PortFilter* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the PPC/MPEG filter settings of a GBE port.

Parameters

|     |                   |                                 |
|-----|-------------------|---------------------------------|
| in  | <i>RefPhys</i>    | specifies BoardNr and PortNr.   |
| in  | <i>Type</i>       | specifies the port filter type. |
| out | <i>PortFilter</i> |                                 |

**Exceptions**

|                       |                                                                                                                                                 |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When called for other boards than GbE ones (Main, asi, ..).                                                                                     |

|                       |                                                                                                                                                                                       |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When called for other boards than GbE ones (Main, asi, ..).                                                                                                                           |
| <i>OpNotSucceeded</i> | in case of <ul style="list-style-type: none"> <li>Invalid references RefPhys (BoardNr, PortNr)</li> <li>ePortFilterType out of range</li> <li>ePortFilterMode out of range</li> </ul> |

**8.32.3.3 void DCM::DeviceControl::IPS\_GBE\_UdpBndryGet ( in IPS\_Ref\_t *RefPhys*, out unsigned short *UDP\_Boundary* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)**

Query the board-specific UDP threshold.

**Parameters**

|    |                     |                            |
|----|---------------------|----------------------------|
| in | <i>RefPhys</i>      | Board and port number.     |
| in | <i>UDP_Boundary</i> | UDP port number threshold. |

**Exceptions**

|                       |                                                                                |
|-----------------------|--------------------------------------------------------------------------------|
| <i>Timeout</i>        | A timeout occurred during IIOP processing.                                     |
| <i>OpNotSucceeded</i> | If RefPhys contains an invalid board or port number.                           |
| <i>OpNotAllowed</i>   | Not logged on.                                                                 |
| <i>OpNotSupported</i> | When called for another board than a GbE one (e.g. mainboard or an ASI board). |
| <i>OutOfRange</i>     | Never thrown.                                                                  |

**8.32.3.4** void DCM::DeviceControl::IPS\_GBE\_UdpBndrySet ( in IPS\_Ref\_t *RefPhys*, in unsigned short *UDP\_Boundary* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)

Specifies the range of UDP ports for which traffic will be sent to the CPU instead of being processed by the firmware.

This setting applies to all ports of the specified board.

#### Parameters

|    |                     |                                                                                                                                                                                                |
|----|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>RefPhys</i>      | Board and port number. Port number is ignored.                                                                                                                                                 |
| in | <i>UDP_Boundary</i> | All incoming UDP traffic with port number below the <i>UDP_Boundary</i> threshold will be sent to the CPU. The default is zero, which means that all UDP traffic is processed by the firmware. |

#### Exceptions

|                       |                                                             |
|-----------------------|-------------------------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing.                  |
| <i>OpNotSucceeded</i> | If <i>RefPhys</i> contains an invalid board or port number. |
| <i>OpNotAllowed</i>   | Not logged on.                                              |
| <i>OpNotSupported</i> | When called for a non-GbE board.                            |
| <i>OutOfRange</i>     | Never thrown.                                               |

**8.32.3.5** void DCM::DeviceControl::PassPacketsWithCRC\_Error\_Get ( in unsigned short *BoardNr*, out boolean *bPass* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Query if IP input packets with CRC error are being passed or dropped.

#### Parameters

|     |                |                                                                                   |
|-----|----------------|-----------------------------------------------------------------------------------|
| in  | <i>BoardNr</i> |                                                                                   |
| out | <i>bPass</i>   | If true, packets with CRC errors are passed, otherwise dropped. Default is false. |

#### Exceptions

|                       |                                            |
|-----------------------|--------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing. |
| <i>OpNotSucceeded</i> | When <i>boardnr</i> is invalid.            |
| <i>OpNotAllowed</i>   | Not logged on.                             |
| <i>OpNotSupported</i> | When called for a non-GbE board.           |

#### Version

Release 10.10

**8.32.3.6** void DCM::DeviceControl::PassPacketsWithCRC\_Error\_Set ( in unsigned short *BoardNr*, in boolean *bPass* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Drop or pass IP input packets with CRC error.

**Parameters**

|    |                |                                                                 |
|----|----------------|-----------------------------------------------------------------|
| in | <i>BoardNr</i> |                                                                 |
| in | <i>bPass</i>   | If true, packets with CRC errors are passed, otherwise dropped. |

**Exceptions**

|                       |                                            |
|-----------------------|--------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing. |
| <i>OpNotSucceeded</i> | When boardnr is invalid.                   |
| <i>OpNotAllowed</i>   | Not logged on.                             |
| <i>OpNotSupported</i> | When called for a non-GbE board.           |

**Version**

Release 10.10

## 8.33 RTP

This module contains types, enums and methods related to RTP (Real-Time Protocol).

Collaboration diagram for RTP:

### Classes

- struct [DCM::DeviceControl::IPS\\_OutTS\\_RTP\\_t](#)

### Typedefs

- typedef sequence< [IPS\\_OutTS\\_RTP\\_t](#) > [DCM::DeviceControl::IPS\\_OutTS\\_RTP\\_List\\_t](#)

### Enumerations

- enum [DCM::DeviceControl::eRTP](#) { [DCM::DeviceControl::eRTP\\_OFF](#), [DCM::DeviceControl::eRTP\\_ON](#) }

### Functions

- void [DCM::DeviceControl::OutTS\\_RTP\\_SetL](#) (in [IPS\\_Ref\\_t](#) RefPhys, in [IPS\\_OutTS\\_RTP\\_List\\_t](#) RTPList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Set RTP setting for some OutTS.*
- void [DCM::DeviceControl::OutTS\\_RTP\\_GetL](#) (in [IPS\\_Ref\\_t](#) RefPhys, in [IPS\\_RefTS\\_List\\_t](#) TSList, out [IPS\\_OutTS\\_RTP\\_List\\_t](#) RTPList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get RTP setting for some OutTS.*
- void [DCM::DeviceControl::SetDefault\\_RTP](#) (in [IPS\\_Ref\\_t](#) RefPhys, in [eRTP](#) RTPOnOff) raises (-Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Set default RTP setting to be used for new OutTS.*
- void [DCM::DeviceControl::GetDefault\\_RTP](#) (in [IPS\\_Ref\\_t](#) RefPhys, out [eRTP](#) RTPOnOff) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get default RTP setting used for new OutTS.*

#### 8.33.1 Detailed Description

This module contains types, enums and methods related to RTP (Real-Time Protocol). RTP info can help the receiver to maintain QoS. See also [FEC](#). RTP is a (Out)TS level feature .

### 8.33.2 Typedef Documentation

#### 8.33.2.1 typedef sequence<IPS\_OutTS\_RTP\_t> DCM::DeviceControl::IPS\_OutTS\_RTP\_List\_t

Definition at line 17919 of file DCM.idl.

### 8.33.3 Enumeration Type Documentation

#### 8.33.3.1 enum DCM::DeviceControl::eRTP

Enumerator:

**eRTP\_OFF** No RTP headers in packets.

**eRTP\_ON** RTP headers in packets.

Definition at line 17907 of file DCM.idl.

### 8.33.4 Function Documentation

#### 8.33.4.1 void DCM::DeviceControl::GetDefault\_RTP ( in IPS\_Ref\_t *RefPhys*, out eRTP *RTPOnOff* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get default RTP setting used for new OutTS.

Default is attached to a board.

#### Parameters

|     |                 |                       |
|-----|-----------------|-----------------------|
| in  | <i>RefPhys</i>  | Identifies the board. |
| out | <i>RTPOnOff</i> |                       |

#### Returns

RTPOnOff The default

#### Exceptions

|                       |                                                                                                    |
|-----------------------|----------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When called for mainboard.                                                                         |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>Called for an non-GbE I/O board (asi)</li> </ul> |

#### 8.33.4.2 void DCM::DeviceControl::OutTS\_RTP\_GetL ( in IPS\_Ref\_t *RefPhys*, in IPS\_RefTS\_List\_t *TSList*, out IPS\_OutTS\_RTP\_List\_t *RTPList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get RTP setting for some OutTS.

#### Parameters

|    |                |                                                                                                                |
|----|----------------|----------------------------------------------------------------------------------------------------------------|
| in | <i>RefPhys</i> | The port the OutTS are attached to. ANY_PORT is NOT allowed                                                    |
| in | <i>TSList</i>  | List of Referenced of OutputTs for which to return the RTP Setting. - Empty list=all OutTS attached to RefPhys |

|     |                |  |
|-----|----------------|--|
| out | <i>RTPList</i> |  |
|-----|----------------|--|

**Returns**

RTPList List of RefTs/eRTP pairs

**Exceptions**

|                       |                                                                                                                                                                                |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When called for mainboard.                                                                                                                                                     |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>• Called for an non-GbE I/O board (asi)</li> <li>• RefPhys does not exist</li> <li>• RefTs does not match RefPhys</li> </ul> |

**8.33.4.3** void DCM::DeviceControl::OutTS\_RTP\_SetL ( in IPS\_Ref\_t *RefPhys*, in IPS\_OutTS\_RTP\_List\_t *RTPList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set RTP setting for some OutTS.

**Parameters**

|    |                |                                                             |
|----|----------------|-------------------------------------------------------------|
| in | <i>RefPhys</i> | The port the OutTS are attached to. ANY_PORT is NOT allowed |
| in | <i>RTPList</i> | List of RefTs/eRTP pairs                                    |

**Exceptions**

|                       |                                                                                                                                                                                                                                                               |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When called for mainboard.                                                                                                                                                                                                                                    |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>• Called for an non-GbE I/O board (asi)</li> <li>• RefPhys does not exist</li> <li>• RefTs does not match RefPhys</li> <li>• eRTP invalid</li> <li>• Disabling RTP while FEC encoding is enabled</li> </ul> |

**8.33.4.4** void DCM::DeviceControl::SetDefault\_RTP ( in IPS\_Ref\_t *RefPhys*, in eRTP *RTPOnOff* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set default RTP setting to be used for new OutTS.

Default is attached to a board.

**Parameters**

|    |                 |                      |
|----|-----------------|----------------------|
| in | <i>RefPhys</i>  | Identifies the bord. |
| in | <i>RTPOnOff</i> | The default          |

**Exceptions**

|                       |                                                                                                                                                                                                     |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When called for mainboard.                                                                                                                                                                          |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"><li>• Called for an non-GbE I/O board (asi)</li><li>• RTPOnOff invalid</li><li>• Default disabling RTP while FEC encoding is default enabled</li></ul> |

## 8.34 VLAN

This module contains types, enums and methods related to VLAN (Virtual LAN).

Collaboration diagram for VLAN:

### Classes

- struct [DCM::DeviceControl::VLAN\\_Settings\\_t](#)
- struct [DCM::DeviceControl::OutTS\\_VLAN\\_t](#)

### Typedefs

- typedef sequence< OutTS\_VLAN\_t > [DCM::DeviceControl::OutTS\\_VLAN\\_List\\_t](#)

### Enumerations

- enum [DCM::DeviceControl::eVLAN](#) { [DCM::DeviceControl::eVLAN\\_OFF](#), [DCM::DeviceControl::eVLAN\\_ON](#) }

### Functions

- void [DCM::DeviceControl::OutTS\\_VLAN\\_SetL](#) (in IPS\_Ref\_t RefPhys, in OutTS\_VLAN\_List\_t VLANList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Set VLAN settings for some OutTS.*
- void [DCM::DeviceControl::OutTS\\_VLAN\\_GetL](#) (in IPS\_Ref\_t RefPhys, in IPS\_RefTS\_List\_t RefTsList, out OutTS\_VLAN\_List\_t VLANList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get VLAN settings for some OutTS.*
- void [DCM::DeviceControl::SetDefault\\_VLAN](#) (in IPS\_Ref\_t RefPhys, in VLAN\_Settings\_t VLAN\_Settings) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Set default VLAN settings to be used for new OutTS.*
- void [DCM::DeviceControl::GetDefault\\_VLAN](#) (in IPS\_Ref\_t RefPhys, out VLAN\_Settings\_t VLAN\_Settings) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get default VLAN settings that are used for new OutTS.*

#### 8.34.1 Detailed Description

This module contains types, enums and methods related to VLAN (Virtual LAN). VLAN is an ethernet feature to create independent logical networks within a physical network. VLAN is a (Out)TS level feature

### 8.34.2 Typedef Documentation

#### 8.34.2.1 typedef sequence<OutTS\_VLAN\_t> DCM::DeviceControl::OutTS\_VLAN\_List\_t

Definition at line 18017 of file DCM.idl.

### 8.34.3 Enumeration Type Documentation

#### 8.34.3.1 enum DCM::DeviceControl::eVLAN

Enumerator:

- eVLAN\_OFF* no VLAN headers in packets
- eVLAN\_ON* VLAN headers present in packets.

Definition at line 17994 of file DCM.idl.

### 8.34.4 Function Documentation

#### 8.34.4.1 void DCM::DeviceControl::GetDefault\_VLAN ( in IPS\_Ref\_t *RefPhys*, out VLAN\_Settings\_t *VLAN\_Settings* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get default VLAN settings that are used for new OutTS.

Defaults are attached to a (logical) port.

##### Parameters

|     |                      |                                            |
|-----|----------------------|--------------------------------------------|
| in  | <i>RefPhys</i>       | Identifies the port. No wildcards allowed. |
| out | <i>VLAN_Settings</i> |                                            |

##### Returns

VLAN\_Settings The defaults

##### Exceptions

|                       |                                                                                                                    |
|-----------------------|--------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When called for other boards than GbE ones (Main, asi, ..).                                                        |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>• <i>RefPhys</i> does not exist (or is a backup port)</li> </ul> |

#### 8.34.4.2 void DCM::DeviceControl::OutTS\_VLAN\_GetL ( in IPS\_Ref\_t *RefPhys*, in IPS\_RefTS\_List\_t *RefTsList*, out OutTS\_VLAN\_List\_t *VLANList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get VLAN settings for some OutTS.

##### Parameters

|    |                |                                                       |
|----|----------------|-------------------------------------------------------|
| in | <i>RefPhys</i> | The port the OutTS are attached to. ANY_PORT allowed. |
|----|----------------|-------------------------------------------------------|

|     |                  |                                                                                                               |
|-----|------------------|---------------------------------------------------------------------------------------------------------------|
| in  | <i>RefTsList</i> | List of Referenced of OutTS for which to return the VLAN Settings. - Empty list=all OutTs attached to RefPhys |
| out | <i>VLANList</i>  |                                                                                                               |

**Returns**

VLANList List of RefTs/VLAN\_Settings pairs

**Exceptions**

|                       |                                                                                                                                                     |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When the board is not a GbE board, IP Video Adapter board or IP Audio Gateway board.                                                                |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>• RefPhys does not exist (or is a backup port)</li> <li>• RefTs does not match RefPhys</li> </ul> |

**8.34.4.3** void DCM::DeviceControl::OutTS\_VLAN\_SetL ( in IPS\_Ref\_t *RefPhys*, in OutTS\_VLAN\_List\_t *VLANList* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set VLAN settings for some OutTS.

**Parameters**

|    |                 |                                                      |
|----|-----------------|------------------------------------------------------|
| in | <i>RefPhys</i>  | The port the OutTS are attached to. ANY_PORT allowed |
| in | <i>VLANList</i> | List of RefTs/VLAN_Settings pairs                    |

**Exceptions**

|                       |                                                                                                                                                                                           |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When the board is not a GbE board, IP Video Adapter board or IP Audio Gateway board.                                                                                                      |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>• RefPhys does not exist (or is a backup port)</li> <li>• VLAN_Settings out of range</li> <li>• RefTs does not match RefPhys</li> </ul> |

**8.34.4.4** void DCM::DeviceControl::SetDefault\_VLAN ( in IPS\_Ref\_t *RefPhys*, in VLAN\_Settings\_t *VLAN\_Settings* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set default VLAN settings to be used for new OutTS.

Defaults are attached to a (logical) port.

**Parameters**

|    |                      |                                            |
|----|----------------------|--------------------------------------------|
| in | <i>RefPhys</i>       | Identifies the port. No wildcards allowed. |
| in | <i>VLAN_Settings</i> | The defaults                               |

**Exceptions**

|                       |                                                                                                                                                |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When called for other boards than GbE ones (Main, asi, ..).                                                                                    |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"><li>• RefPhys does not exist (or is a backup port)</li><li>• VLAN_Settings out of range</li></ul> |

## 8.35 TOS

This module contains types, enums and methods related to TOS (Type of Service).

Collaboration diagram for TOS:

### Classes

- struct [DCM::DeviceControl::OutTS\\_TOS\\_t](#)

### Typedefs

- typedef sequence< OutTS\_TOS\_t > [DCM::DeviceControl::OutTS\\_TOS\\_List\\_t](#)

### Functions

- void [DCM::DeviceControl::OutTS\\_TOS\\_SetL](#) (in IPS\_Ref\_t RefPhys, in OutTS\_TOS\_List\_t TOS\_List) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

- void [DCM::DeviceControl::OutTS\\_TOS\\_GetL](#) (in IPS\_Ref\_t RefPhys, in IPS\_RefTS\_List\_t RefTsList, out OutTS\_TOS\_List\_t TOS\_List) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get TOS settings for some OutTS.*
- void [DCM::DeviceControl::SetDefault\\_TOS](#) (in unsigned short Board, in unsigned short TOS\_Value) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Set default TOS settings to be used for new OutTS.*
- void [DCM::DeviceControl::GetDefault\\_TOS](#) (in unsigned short Board, out unsigned short TOS\_Value) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get default TOS settings that are used for new OutTS.*

### 8.35.1 Detailed Description

This module contains types, enums and methods related to TOS (Type of Service). TOS is an IP header field to identify the QOS. TOS is a (Out)TS level feature that can be configured.

### 8.35.2 Typedef Documentation

#### 8.35.2.1 typedef sequence<OutTS\_TOS\_t> DCM::DeviceControl::OutTS\_TOS\_List\_t

Definition at line 18096 of file DCM.idl.

## 8.35.3 Function Documentation

**8.35.3.1** void DCM::DeviceControl::GetDefault\_TOS ( in unsigned short *Board*, out unsigned short *TOS\_Value* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get default TOS settings that are used for new OutTS.

Defaults are attached to a board.

**Parameters**

|     |                  |                     |
|-----|------------------|---------------------|
| in  | <i>Board</i>     | Specifies the board |
| out | <i>TOS_Value</i> | The default         |

**Returns**

TOS\_Value The default

**Exceptions**

|                       |                                                                                               |
|-----------------------|-----------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When called for other boards than GbE ones (Main, asi, ..).                                   |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>• When the mainboard is supplied</li> </ul> |

**8.35.3.2** void DCM::DeviceControl::OutTS\_TOS\_GetL ( in IPS\_Ref\_t *RefPhys*, in IPS\_RefTS\_List\_t *RefTsList*, out OutTS\_TOS\_List\_t *TOS\_List* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get TOS settings for some OutTS.

**Parameters**

|     |                  |                                                                                                            |
|-----|------------------|------------------------------------------------------------------------------------------------------------|
| in  | <i>RefPhys</i>   | The port the OutTS are attached to.                                                                        |
| in  | <i>RefTsList</i> | List of Referenced of OutTS for which to return the TOS Settings. Empty list=all OutTs attached to RefPhys |
| out | <i>TOS_List</i>  |                                                                                                            |

**Returns**

TOS\_List List of RefTs/TOS\_Value pairs

**Exceptions**

|                       |                                                                                                                                                     |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When the board is not a GbE board, IP Video Adapter board or IP Audio Gateway board.                                                                |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>• RefPhys does not exist (or is a backup port)</li> <li>• RefTs does not match RefPhys</li> </ul> |

**8.35.3.3** void DCM::DeviceControl::OutTS\_TOS\_SetL ( in IPS\_Ref\_t *RefPhys*, in OutTS\_TOS\_List\_t *TOS\_List* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set TOS settings for some OutTS.

#### Parameters

|    |                 |                                     |
|----|-----------------|-------------------------------------|
| in | <i>RefPhys</i>  | The port the OutTS are attached to. |
| in | <i>TOS_List</i> | List of RefTs/TOS_Value pairs       |

#### Exceptions

|                       |                                                                                                                                                                                                                 |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When the board is not a GbE board, IP Video Adapter board or IP Audio Gateway board.                                                                                                                            |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>• RefPhys does not exist (or is a backup port)</li> <li>• TOS_Value out of range (accepted range is 0-255)</li> <li>• RefTs does not match RefPhys</li> </ul> |

**8.35.3.4** void DCM::DeviceControl::SetDefault\_TOS ( in unsigned short *Board*, in unsigned short *TOS\_Value* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set default TOS settings to be used for new OutTS.

Defaults are attached to a board.

#### Parameters

|    |                  |                     |
|----|------------------|---------------------|
| in | <i>Board</i>     | Specifies the board |
| in | <i>TOS_Value</i> | The default         |

#### Exceptions

|                       |                                                                                                                                                           |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When called for other boards than GbE ones (Main, asi, ..).                                                                                               |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>• When the mainboard is supplied</li> <li>• TOS_Value out of range (accepted range is 0-255)</li> </ul> |

## 8.36 Source Ip/Udp

This module contains types, enums and methods related to set the source ip and or udp port of an outgoing transport stream.

Collaboration diagram for Source Ip/Udp:

### Classes

- struct [DCM::DeviceControl::SrcAddr\\_t](#)  
*Structure to specify some Ip header parameters for outgoing GbE packets.*
- struct [DCM::DeviceControl::OutTS\\_SrcAddr\\_t](#)  
*Source Address parameters for an OutTS.*
- struct [DCM::DeviceControl::OutTS\\_SrcAddr\\_V2\\_t](#)

### Typedefs

- typedef sequence< OutTS\_SrcAddr\_t > [DCM::DeviceControl::OutTS\\_SrcAddr\\_List\\_t](#)
- typedef sequence < OutTS\_SrcAddr\_V2\_t > [DCM::DeviceControl::OutTS\\_SrcAddr\\_V2\\_List\\_t](#)

### Functions

- void [DCM::DeviceControl::OutTS\\_SrcAddr\\_SetL](#) (in IPS\_Ref\_t RefPhys, in OutTS\_SrcAddr\_List\_t SrcAddr\_List) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Set Source Address settings for some OutTS.*
- void [DCM::DeviceControl::OutTS\\_SrcAddr\\_V2\\_SetL](#) (in IPS\_Ref\_t RefPhys, in OutTS\_SrcAddr\_V2\_List\_t SrcAddr\_List) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)
- void [DCM::DeviceControl::OutTS\\_SrcAddr\\_GetL](#) (in IPS\_Ref\_t RefPhys, in IPS\_RefTS\_List\_t - RefTsList, out OutTS\_SrcAddr\_List\_t SrcAddr\_List) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get Source Address settings for some OutTS.*
- void [DCM::DeviceControl::OutTS\\_SrcAddr\\_V2\\_GetL](#) (in IPS\_Ref\_t RefPhys, in IPS\_RefTS\_List\_t RefTsList, out OutTS\_SrcAddr\_V2\_List\_t SrcAddr\_List) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

#### 8.36.1 Detailed Description

This module contains types, enums and methods related to set the source ip and or udp port of an outgoing transport stream.

#### 8.37.1 Detailed Description

This module contains types, enums and methods related to TTL ([Time](#) to live). TTL is an IP header field. TTL is a (Out)TS level feature .

#### 8.37.2 Typedef Documentation

##### 8.37.2.1 typedef sequence<OutTS\_TTL\_t> DCM::DeviceControl::OutTS\_TTL\_List\_t

Definition at line 18256 of file DCM.idl.

### 8.37.3 Function Documentation

**8.37.3.1** void DCM::DeviceControl::GetDefault\_TTL ( in unsigned short *Board*, out unsigned short *TTL\_Value* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get default TTL settings that are used for new OutTS.

Defaults are attached to a (logical) port.

#### Parameters

|     |                  |                     |
|-----|------------------|---------------------|
| in  | <i>Board</i>     | Specifies the board |
| out | <i>TTL_Value</i> | The default         |

#### Returns

TTL\_Value The default

#### Exceptions

|                       |                                                                                               |
|-----------------------|-----------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When called for other boards than GbE ones (Main, asi, ..).                                   |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>- When the mainboard is supplied</li> </ul> |

**8.37.3.2** void DCM::DeviceControl::OutTS\_TTL\_GetL ( in IPS\_Ref\_t *RefPhys*, in IPS\_RefTS\_List\_t *RefTsList*, out OutTS\_TTL\_List\_t *TTL\_List* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get TTL settings for some OutTS.

#### Parameters

|     |                  |                                                                                                            |
|-----|------------------|------------------------------------------------------------------------------------------------------------|
| in  | <i>RefPhys</i>   | The port the OutTS are attached to.                                                                        |
| in  | <i>RefTsList</i> | List of Referenced of OutTS for which to return the TTL Settings. Empty list=all OutTs attached to RefPhys |
| out | <i>TTL_List</i>  |                                                                                                            |

#### Returns

TTL\_List List of RefTs/TTL\_Value pairs

#### Exceptions

|                       |                                                                                                                                                 |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When the board is not a GbE board, IP Video Adapter board or IP Audio Gateway board.                                                            |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>RefPhys does not exist (or is a backup port)</li> <li>RefTs does not match RefPhys</li> </ul> |

**8.37.3.3** void DCM::DeviceControl::OutTS\_TTL\_SetL ( in IPS\_Ref\_t *RefPhys*, in OutTS\_TTL\_List\_t *TTL\_List* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set TTL settings for some OutTS.

#### Parameters

|    |                 |                                     |
|----|-----------------|-------------------------------------|
| in | <i>RefPhys</i>  | The port the OutTS are attached to. |
| in | <i>TTL_List</i> | List of RefTs/TTL_Value pairs       |

#### Exceptions

|                       |                                                                                                                                                                                                                   |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When the board is not a GbE board, IP Video Adapter board or IP Audio Gateway board.                                                                                                                              |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>• RefPhys does not exist (or is a backup port)</li> <li>• TTL_Value out of range (accepted range is [1-255])</li> <li>• RefTs does not match RefPhys</li> </ul> |

**8.37.3.4** void DCM::DeviceControl::SetDefault\_TTL ( in unsigned short *Board*, in unsigned short *TTL\_Value* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set default TTL settings to be used for new OutTS.

Defaults are attached to a board.

#### Parameters

|    |                  |                     |
|----|------------------|---------------------|
| in | <i>Board</i>     | Specifies the board |
| in | <i>TTL_Value</i> | The default         |

#### Exceptions

|                       |                                                                                                                                                             |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When called for other boards than GbE ones (Main, asi, ..).                                                                                                 |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>• When the mainboard is supplied</li> <li>• TTL_Value out of range (accepted range is [1-255])</li> </ul> |

## 8.38 VBR

This module contains types, enums and methods related to VBR (Variable Bitrate).

Collaboration diagram for VBR:

### Classes

- struct [DCM::DeviceControl::OutTS\\_VBR\\_t](#)

### Typedefs

- typedef sequence< OutTS\_VBR\_t > [DCM::DeviceControl::OutTS\\_VBR\\_List\\_t](#)

### Enumerations

- enum [DCM::DeviceControl::eVBR](#) { [DCM::DeviceControl::eVBR\\_OFF](#), [DCM::DeviceControl::eVBR\\_ON](#) }

### Functions

- void [DCM::DeviceControl::OutTS\\_VBR\\_SetL](#) (in IPS\_Ref\_t RefPhys, in OutTS\_VBR\_List\_t VBRList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Set VBR setting for some OutTS.*
- void [DCM::DeviceControl::OutTS\\_VBR\\_GetL](#) (in IPS\_Ref\_t RefPhys, in IPS\_RefTS\_List\_t RefTsList, out OutTS\_VBR\_List\_t VBRList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get VBR setting for some OutTS.*
- void [DCM::DeviceControl::SetDefault\\_VBR](#) (in IPS\_Ref\_t RefPhys, in eVBR VBROnOff) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Set default VBR setting to be used for new OutTS.*
- void [DCM::DeviceControl::GetDefault\\_VBR](#) (in IPS\_Ref\_t RefPhys, out eVBR VBROnOff) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get default VBR setting used for new OutTS.*

#### 8.38.1 Detailed Description

This module contains types, enums and methods related to VBR (Variable Bitrate). An OutTS can have a fixed/constant bitrate (CBR) or a variable one (VBR). VBR is a (Out)TS level feature .

### 8.38.2 Typedef Documentation

#### 8.38.2.1 typedef sequence<OutTS\_VBR\_t> DCM::DeviceControl::OutTS\_VBR\_List\_t

Definition at line 18336 of file DCM.idl.

### 8.38.3 Enumeration Type Documentation

#### 8.38.3.1 enum DCM::DeviceControl::eVBR

Enumerator:

*eVBR\_OFF* CBR.

*eVBR\_ON* VBR.

Definition at line 18325 of file DCM.idl.

### 8.38.4 Function Documentation

#### 8.38.4.1 void DCM::DeviceControl::GetDefault\_VBR ( in IPS\_Ref\_t *RefPhys*, out eVBR *VBROnOff* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get default VBR setting used for new OutTS.

Default is attached to a board.

##### Parameters

|     |                 |                                                  |
|-----|-----------------|--------------------------------------------------|
| in  | <i>RefPhys</i>  | Identifies the board. Only board member is used. |
| out | <i>VBROnOff</i> |                                                  |

##### Returns

VBROnOff The default

##### Exceptions

|                       |                                                             |
|-----------------------|-------------------------------------------------------------|
| <i>OpNotSupported</i> | When called for other boards than GbE ones (Main, asi, ..). |
|-----------------------|-------------------------------------------------------------|

#### 8.38.4.2 void DCM::DeviceControl::OutTS\_VBR\_GetL ( in IPS\_Ref\_t *RefPhys*, in IPS\_RefTS\_List\_t *RefTsList*, out OutTS\_VBR\_List\_t *VBRList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get VBR setting for some OutTS.

##### Parameters

|    |                  |                                                                                                                |
|----|------------------|----------------------------------------------------------------------------------------------------------------|
| in | <i>RefPhys</i>   | The port the OutTS are attached to ANY_PORT allowed                                                            |
| in | <i>RefTsList</i> | List of Referenced of OutputTs for which to return the VBR Setting. - Empty list=all OutTS attached to RefPhys |
| in | <i>VBRList</i>   |                                                                                                                |

**Returns**

VBRList List of RefTs/eVBR pairs

**Exceptions**

|                       |                                                                                                                                                     |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When called for other boards than GbE ones (Main, asi, ..).                                                                                         |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>• RefPhys does not exist (or is a backup port)</li> <li>• RefTs does not match RefPhys</li> </ul> |

**8.38.4.3** void DCM::DeviceControl::OutTS\_VBR\_SetL ( in IPS\_Ref\_t *RefPhys*, in OutTS\_VBR\_List\_t *VBRList* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set VBR setting for some OutTS.

**Parameters**

|    |                |                                                      |
|----|----------------|------------------------------------------------------|
| in | <i>RefPhys</i> | The port the OutTS are attached to. ANY_PORT allowed |
| in | <i>VBRList</i> | List of RefTs/eVBR pairs                             |

**Exceptions**

|                       |                                                                                                                                                                                                                                                                                                            |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When called for other boards than GbE ones (Main, asi, ..).                                                                                                                                                                                                                                                |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>• RefPhys does not exist (or is a backup port)</li> <li>• eVBR out of range</li> <li>• RefTs does not match RefPhys</li> <li>• VBR-&gt;CBR: Bitrate for port exceeded (VBR counts as 0)</li> <li>• Enabling VBR while FEC encoding is enabled</li> </ul> |

**8.38.4.4** void DCM::DeviceControl::SetDefault\_VBR ( in IPS\_Ref\_t *RefPhys*, in eVBR *VBROnOff* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set default VBR setting to be used for new OutTS.

Default is attached to a board.

**Parameters**

|    |                 |                                                 |
|----|-----------------|-------------------------------------------------|
| in | <i>RefPhys</i>  | Identifies the bord. Only board member is used. |
| in | <i>VBROnOff</i> | The default                                     |

**Exceptions**

|                       |                                                                                                                                                    |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When called for other boards than GbE ones (Main, asi, ..).                                                                                        |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"><li>• VBROnOff invalid</li><li>• Default enabling VBR while FEC encoding is default enabled</li></ul> |

## 8.39 UDP Size

This module contains types and methods related to UDP Size.

Collaboration diagram for UDP Size:

### Classes

- struct [DCM::DeviceControl::OutTS\\_UdpSize\\_t](#)

### Typedefs

- typedef sequence< OutTS\_UdpSize\_t > [DCM::DeviceControl::OutTS\\_UdpSize\\_List\\_t](#)

### Functions

- void [DCM::DeviceControl::SetDefault\\_UdpSize](#) (in unsigned short BoardNr, in unsigned short UdpSize) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Set default UdpSize to be used for new output TSs.*
- void [DCM::DeviceControl::GetDefault\\_UdpSize](#) (in unsigned short BoardNr, out unsigned short - UdpSize) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get default UdpSize that are used for new output TSs.*
- void [DCM::DeviceControl::OutTS\\_UdpSize\\_SetL](#) (in IPS\_Ref\_t RefPhys, in OutTS\_UdpSize\_List\_t UdpSizeList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Set UdpSize per output TS.*
- void [DCM::DeviceControl::OutTS\\_UdpSize\\_GetL](#) (in IPS\_Ref\_t RefPhys, in IPS\_RefTS\_List\_t - RefTsList, out OutTS\_UdpSize\_List\_t UdpList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get UdpSize per output TS.*

#### 8.39.1 Detailed Description

This module contains types and methods related to UDP Size. For a GBE OutTS each UDP packet can contain 1 to 7 MPEG packets. These methods are used to change the default or the number per TS.

#### 8.39.2 Typedef Documentation

##### 8.39.2.1 typedef sequence<OutTS\_UdpSize\_t> DCM::DeviceControl::OutTS\_UdpSize\_List\_t

Definition at line 18413 of file DCM.idl.

## 8.39.3 Function Documentation

**8.39.3.1** void DCM::DeviceControl::GetDefault\_UdpSize ( in unsigned short *BoardNr*, out unsigned short *UdpSize* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get default UdpSize that are used for new output TSs.

Defaults are attached to a board.

## Parameters

|     |                |                                       |
|-----|----------------|---------------------------------------|
| in  | <i>BoardNr</i> | Identifies the board.                 |
| out | <i>UdpSize</i> | The default UDP size (1 <= size <= 7) |

## Exceptions

|                       |                                                             |
|-----------------------|-------------------------------------------------------------|
| <i>OpNotSupported</i> | When called for other boards than GbE ones (Main, asi, ..). |
|-----------------------|-------------------------------------------------------------|

## Version

Release 6.5

**8.39.3.2** void DCM::DeviceControl::OutTS\_UdpSize\_GetL ( in IPS\_Ref\_t *RefPhys*, in IPS\_RefTS\_List\_t *RefTsList*, out OutTS\_UdpSize\_List\_t *UdpList* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get UdpSize per output TS.

## Parameters

|                  |                                                                                                    |
|------------------|----------------------------------------------------------------------------------------------------|
| <i>RefPhys</i>   | The port the output TSs are attached to.                                                           |
| <i>RefTsList</i> | List of output TSs for which to return the UdpSize. Empty list=all output TSs attached to RefPhys. |
| <i>UdpList</i>   |                                                                                                    |

## Returns

UdpList List of RefTs/UdpSize pairs

## Exceptions

|                       |                                                                                                                                                     |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When called for other boards than GbE ones (Main, asi, ..).                                                                                         |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>• RefPhys does not exist (or is a backup port)</li> <li>• RefTs does not match RefPhys</li> </ul> |

**Version**

Release 6.5

**8.39.3.3** void DCM::DeviceControl::OutTS\_UdpSize\_SetL ( in IPS\_Ref\_t *RefPhys*, in OutTS\_UdpSize\_List\_t *UdpSizeList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set UdpSize per output TS.

**Parameters**

|                    |                                          |
|--------------------|------------------------------------------|
| <i>RefPhys</i>     | The port the output TSs are attached to. |
| <i>UdpSizeList</i> | List of RefTs/UdpSize pairs              |

**Returns**

None

**Exceptions**

|                       |                                                                                                                                                                                 |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When called for other boards than GbE ones (Main, asi, ..).                                                                                                                     |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"><li>• RefPhys does not exist (or is a backup port)</li><li>• UdpSize out of range</li><li>• RefTs does not match RefPhys</li></ul> |

**Version**

Release 6.5

**8.39.3.4** void DCM::DeviceControl::SetDefault\_UdpSize ( in unsigned short *BoardNr*, in unsigned short *UdpSize* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set default UdpSize to be used for new output TSs.

Defaults are attached to a board.

**Parameters**

|                |                                        |
|----------------|----------------------------------------|
| <i>BoardNr</i> | Identifies the board.                  |
| <i>UdpSize</i> | The default UDP Size. (1 <= size <= 7) |

**Returns**

None

**Exceptions**

|                       |                                                                                   |
|-----------------------|-----------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When called for other boards than GbE ones (Main, asi, ..).                       |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"><li>• UdpSize out of range</li></ul> |

**Version**

Release 6.5

## 8.40 ARP

This module contains types, enums and methods related to ARP.

Collaboration diagram for ARP:

### Classes

- struct [DCM::DeviceControl::ArpEntry\\_t](#)

### Typedefs

- typedef sequence< [ArpEntry\\_t](#) > [DCM::DeviceControl::ArpEntryList\\_t](#)  
*A sequence of [ArpEntry\\_t](#).*

### Enumerations

- enum [DCM::DeviceControl::eArpStatus](#) { [DCM::DeviceControl::ArpStatic](#), [DCM::DeviceControl::ArpResolved](#), [DCM::DeviceControl::ArpUnResolved](#) }
- enum [DCM::DeviceControl::eDestArpStatus](#) { [DCM::DeviceControl::ArpNotApplicable](#), [DCM::DeviceControl::DestStaticArp](#), [DCM::DeviceControl::Multicast](#), [DCM::DeviceControl::GwStaticArp](#), [DCM::DeviceControl::GwResolved](#), [DCM::DeviceControl::GwUnResolved](#), [DCM::DeviceControl::DestResolved](#), [DCM::DeviceControl::DestUnResolved](#) }

### Functions

- void [DCM::DeviceControl::ArpEntryAddL](#) (in [IPS\\_Ref\\_t](#) RefPhys, in [ArpEntryList\\_t](#) ArpEntryList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Add an ARP entry on the specified board.*
- void [DCM::DeviceControl::ArpEntryDeleteL](#) (in [IPS\\_Ref\\_t](#) RefPhys, in [ArpEntryList\\_t](#) ArpEntryList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Removes the specified static ARP entries.*
- [ArpEntryList\\_t](#) [DCM::DeviceControl::ArpEntryGetL](#) (in [IPS\\_Ref\\_t](#) RefPhys) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get the ARP entry list with status indication.*
- [ArpEntryList\\_t](#) [DCM::DeviceControl::ArpEntryGetFilterL](#) (in [IPS\\_Ref\\_t](#) RefPhys, in [eArpStatus](#) - [ArpStatusFilter](#)) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)  
*Get a filtered ARP entry list with status indication.*

### 8.40.1 Detailed Description

This module contains types, enums and methods related to ARP.

### 8.40.2 Typedef Documentation

#### 8.40.2.1 typedef sequence<ArpEntry\_t> DCM::DeviceControl::ArpEntryList\_t

A sequence of [ArpEntry\\_t](#).

Definition at line 18608 of file DCM.idl.

### 8.40.3 Enumeration Type Documentation

#### 8.40.3.1 enum DCM::DeviceControl::eArpStatus

Enumerator:

*ArpStatic*  
*ArpResolved*  
*ArpUnResolved*

Definition at line 18580 of file DCM.idl.

#### 8.40.3.2 enum DCM::DeviceControl::eDestArpStatus

Enumerator:

*ArpNotApplicable*  
*DestStaticArp*  
*Multicast*  
*GwStaticArp*  
*GwResolved*  
*GwUnResolved*  
*DestResolved*  
*DestUnResolved*

Definition at line 18587 of file DCM.idl.

### 8.40.4 Function Documentation

#### 8.40.4.1 void DCM::DeviceControl::ArpEntryAddL ( in IPS\_Ref\_t *RefPhys*, in *ArpEntryList\_t* *ArpEntryList* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Add an ARP entry on the specified board.

An ARP entry is an association between the IP address of an external device (destination, router,...) and its MAC address.

#### Parameters

|    |                     |                                  |
|----|---------------------|----------------------------------|
| in | <i>RefPhys</i>      | Board and port number.           |
| in | <i>ArpEntryList</i> | List of ARP entries to be added. |

## Exceptions

|                       |                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing.                                                                                                                                                                                                                                                                                                                                                                                   |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>• RefPhys of one of the list elements is invalid.</li> <li>• When the ArpStatus of one of the list elements differs from Static.</li> <li>• Inconsistency between RefPhys.BoardNr and ArpEntryList[x].RefPhys.-BoardNr for a list element.</li> <li>• Inconsistency between RefPhys.PortNr and ArpEntryList[x].RefPhys.PortNr in case RefPhys.PortNr != 0xFFFF.</li> </ul> |
| <i>OpNotAllowed</i>   | Not logged on.                                                                                                                                                                                                                                                                                                                                                                                                               |
| <i>OpNotSupported</i> | When called for other boards than GbE ones.                                                                                                                                                                                                                                                                                                                                                                                  |

**8.40.4.2** void DCM::DeviceControl::ArpEntryDeleteL ( in IPS\_Ref\_t *RefPhys*, in ArpEntryList\_t *ArpEntryList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Removes the specified static ARP entries.

## Parameters

|    |                     |                                    |
|----|---------------------|------------------------------------|
| in | <i>RefPhys</i>      | Board and port number.             |
| in | <i>ArpEntryList</i> | List of ARP entries to be removed. |

## Exceptions

|                       |                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing.                                                                                                                                                                                                                                                                                                                                                                                   |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>• RefPhys of one of the list elements is invalid.</li> <li>• When the ArpStatus of one of the list elements differs from Static.</li> <li>• Inconsistency between RefPhys.BoardNr and ArpEntryList[x].RefPhys.-BoardNr for a list element.</li> <li>• Inconsistency between RefPhys.PortNr and ArpEntryList[x].RefPhys.PortNr in case RefPhys.PortNr != 0xFFFF.</li> </ul> |
| <i>OpNotAllowed</i>   | Not logged on.                                                                                                                                                                                                                                                                                                                                                                                                               |
| <i>OpNotSupported</i> | When called for other boards than GbE ones (Main, ASI,...).                                                                                                                                                                                                                                                                                                                                                                  |

## Note

Attempts to remove non-existing ARP entries are silently ignored.

**8.40.4.3** ArpEntryList\_t DCM::DeviceControl::ArpEntryGetFilterL ( in IPS\_Ref\_t *RefPhys*, in eArpStatus *ArpStatusFilter* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)

Get a filtered ARP entry list with status indication.

## Parameters

|    |                        |                                                                                                   |
|----|------------------------|---------------------------------------------------------------------------------------------------|
| in | <i>RefPhys</i>         | Board and port number. When 0xffff is specified for PortNr information for all ports is returned. |
| in | <i>ArpStatusFilter</i> | Filter on this ARP status.                                                                        |

**Returns**

ArpEntryList Requested ARP entry list.

**Exceptions**

|                       |                                                                                  |
|-----------------------|----------------------------------------------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing.                                       |
| <i>OpNotSucceeded</i> | RefPhys refers to a nonexisting board, or an invalid filter value was specified. |
| <i>OpNotAllowed</i>   | Not logged on.                                                                   |
| <i>OpNotSupported</i> | RefPhys refers to a non-GbE board.                                               |

**8.40.4.4** **ArpEntryList.t DCM::DeviceControl::ArpEntryGetL ( in IPS\_Ref\_t *RefPhys* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)**

Get the ARP entry list with status indication.

**Parameters**

|           |                |                                                                                                   |
|-----------|----------------|---------------------------------------------------------------------------------------------------|
| <i>in</i> | <i>RefPhys</i> | Board and port number. When 0xffff is specified for PortNr information for all ports is returned. |
|-----------|----------------|---------------------------------------------------------------------------------------------------|

**Returns**

ArpEntryList Requested ARP entry list.

**Exceptions**

|                       |                                            |
|-----------------------|--------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing. |
| <i>OpNotSucceeded</i> | RefPhys refers to a nonexisting board.     |
| <i>OpNotAllowed</i>   | Not logged on.                             |
| <i>OpNotSupported</i> | RefPhys refers to a non-GbE board.         |

## 8.41 ROUTE

This module contains types, enums and methods related to routing.

Collaboration diagram for ROUTE:

### Classes

- struct [DCM::DeviceControl::IP\\_Route\\_t](#)
- struct [DCM::DeviceControl::IP\\_Route\\_t\\_V2](#)

### Typedefs

- typedef sequence< IP\_Route\_t > [DCM::DeviceControl::IP\\_RouteList\\_t](#)  
*A sequence of [IP\\_Route\\_t](#).*
- typedef sequence< IP\_Route\_t\_V2 > [DCM::DeviceControl::IP\\_RouteList\\_t\\_V2](#)  
*A sequence of [IP\\_Route\\_t\\_V2](#).*

### Enumerations

- enum [DCM::DeviceControl::eDestRoutingStatus](#) { [DCM::DeviceControl::RoutingNotApplicable](#), [DCM::DeviceControl::NotRoutable](#), [DCM::DeviceControl::Routable\\_LAN](#), [DCM::DeviceControl::Routable\\_GW](#) }

### Functions

- void [DCM::DeviceControl::RouteEntryAddL](#) (in [IPS\\_Ref\\_t](#) RefPhys, in [IP\\_RouteList\\_t](#) RouteList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Add or replace static routes on the specified board and port.*
- void [DCM::DeviceControl::RouteEntryIPv6AddL](#) (in [IPS\\_Ref\\_t](#) RefPhys, in [IP\\_RouteList\\_t](#) RouteList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Add or replace static routes on the specified board and port.*
- void [DCM::DeviceControl::RouteEntryDeleteL](#) (in [IPS\\_Ref\\_t](#) RefPhys, in [IP\\_RouteList\\_t](#) RouteList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Delete a list of routes.*

#### 8.41.1 Detailed Description

This module contains types, enums and methods related to routing.

#### 8.41.2 Typedef Documentation

##### 8.41.2.1 typedef sequence<IP\_Route\_t> DCM::DeviceControl::IP\_RouteList\_t

A sequence of [IP\\_Route\\_t](#).

Definition at line 18710 of file DCM.idl.

##### 8.41.2.2 typedef sequence<IP\_Route\_t\_V2> DCM::DeviceControl::IP\_RouteList\_t\_V2

A sequence of [IP\\_Route\\_t\\_V2](#).

Definition at line 18722 of file DCM.idl.

#### 8.41.3 Enumeration Type Documentation

##### 8.41.3.1 enum DCM::DeviceControl::eDestRoutingStatus

Enumerator:

*RoutingNotApplicable*

*NotRoutable*

*Routable\_LAN*

*Routable\_GW*

Definition at line 18724 of file DCM.idl.

## 8.41.4 Function Documentation

**8.41.4.1** void DCM::DeviceControl::RouteEntryAddL ( in IPS\_Ref\_t *RefPhys*, in IP\_RouteList\_t *RouteList* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Add or replace static routes on the specified board and port.

## Parameters

|    |                  |                        |
|----|------------------|------------------------|
| in | <i>RefPhys</i>   | Board and port number. |
| in | <i>RouteList</i> | List with routes.      |

## Exceptions

|                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Timeout</i>        | A timeout occurred during IIOP processing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>Invalid references (RefPhys).</li> <li>When subnet_Gateway != subnet_GbE_port for a GbE Board.</li> <li>When subnet_Gateway != subnet_mainboard_port for the mainboard.</li> <li>When subnet destination host == subnet_GbE_port.</li> <li>When subnet destination host == subnet_mainboard_port of the mainboard.</li> <li>Invalid SubNetMask.</li> <li>Inconsistency between RefPhys.BoardNr &amp; RouteList[x].RefPhys.BoardNr.</li> <li>Inconsistency between RefPhys.PortNr &amp; RouteList[x].RefPhys.PortNr in case RefPhys.PortNr != 0xFFFF.</li> <li>When adding a default gateway for the mainboard</li> </ul> |
| <i>OpNotAllowed</i>   | Not logged on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <i>OpNotSupported</i> | When called for other boards than a GbE-I/O board and the mainboard                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Version

Mainboard support added in release 5.1

## Note

RouteList[i].Static is ignored - all entries are treated as static  
 RouteList[i].RefPhys.BoardNr must match RefPhys.BoardNr  
 To add a default gateway a.b.c.d, specify RouteList[i].IP\_Addr = 0.0.0.0, RouteList[i].SubNetMask = 0.0.0.0 and Gateway = a.b.c.d .  
 Adding a default gateway is only supported on a GbE-I/O board and not on the mainboard  
 If RouteList[i].RefPhys.PortNr == 0xffff, then routing entry i is applied to all ports of the specified board. The route will only be added if RouteList[i].SubNetMask matches the subnet of the port exactly  
 !

**8.41.4.2** void DCM::DeviceControl::RouteEntryAddL\_V2 ( in IPS\_Ref\_t *RefPhys*, in IP\_RouteList\_t\_V2 *RouteList* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Add or replace static routes on the specified board and port.

**Parameters**

|    |                  |                        |
|----|------------------|------------------------|
| in | <i>RefPhys</i>   | Board and port number. |
| in | <i>RouteList</i> | List with routes.      |

**Exceptions**

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Timeout</i>         | A timeout occurred during IIOP processing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <i>OpNotSucceeded</i>  | In case of <ul style="list-style-type: none"> <li>Invalid references (RefPhys).</li> <li>When subnet_Gateway != subnet_mainboard_port for the mainboard.</li> <li>When subnet destination host == subnet_mainboard_port of the mainboard.</li> <li>Invalid PrefixLength.</li> <li>Inconsistency between RefPhys.BoardNr &amp; RouteList[x].RefPhys.BoardNr.</li> <li>Inconsistency between RefPhys.PortNr &amp; RouteList[x].RefPhys.PortNr in case RefPhys.PortNr != 0xFFFF.</li> <li>When adding a default gateway for the mainboard</li> </ul> |
| <i>OpNotAllowed</i>    | Not logged on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <i>OpNotSupported</i>  | When called for other boards than the mainboard                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <i>OperationFailed</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Version**

Mainboard support added in release 10.10

**Note**

RouteList[i].Static is ignored - all entries are treated as static  
RouteList[i].RefPhys.BoardNr must match RefPhys.BoardNr  
For IPv4, to add a default gateway a.b.c.d, specify RouteList[i].IP\_Addr = 0.0.0.0, RouteList[i].PrefixLength = 0 and Gateway = a.b.c.d .  
For IPv6, to add a default gateway a:b:c:d:e:f:g:h, specify RouteList[i].IP\_Addr = ::, RouteList[i].PrefixLength = 0 and Gateway = a:b:c:d:e:f:g:h .  
Adding a default gateway via this call is not supported on the mainboard, use the IPS\_IP\_ParamsMB-Set\_V2 IDL call for this.  
If RouteList[i].RefPhys.PortNr == 0xffff, then routing entry i is applied to all ports of the specified board. The route will only be added if the prefix of the gateway in RouteList[i] matches oen of the prefixes on the port exactly!

**8.41.4.3 void DCM::DeviceControl::RouteEntryDeleteL ( in IPS\_Ref\_t *RefPhys*, in IP\_RouteList\_t *RouteList* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)**

Delete a list of routes.

Only static routes will be deleted.

**Parameters**

|    |                  |                                                       |
|----|------------------|-------------------------------------------------------|
| in | <i>RefPhys</i>   | Specifies BoardNr & PortNr to delete the routes from. |
| in | <i>RouteList</i> | List with routes.                                     |

**Exceptions**

|                       |                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing.                                                                                                                                                                                                                                                                                                                     |

| <i>OpNotAllowed</i>   | Not logged on.                                                                                                                                                                                                                                                                                                                                                 |
| <i>OpNotSupported</i> | When called for other boards than a GbE-I/O board and the mainboard                                                                                                                                                                                                                                                                                            |

**Version**

Mainboard support added in release 5.1

**Note**

RouteList[i].Static is ignored - all entries are treated as static

To delete a default gateway a.b.c.d, set IP\_Addr to 0.0.0.0, SubNetMask = 0.0.0.0 and Gateway to a.b.c.d .

Deleting a default gateway is only supported on a GbE-I/O board and not on the mainboard

**8.41.4.4** void DCM::DeviceControl::RouteEntryDeleteL\_V2 ( in IPS\_Ref\_t RefPhys, in IP\_RouteList\_t\_V2 RouteList ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Delete a list of routes.

Only static routes will be deleted.

**Parameters**

|    |                  |                                                       |
|----|------------------|-------------------------------------------------------|
| in | <i>RefPhys</i>   | Specifies BoardNr & PortNr to delete the routes from. |
| in | <i>RouteList</i> | List with routes.                                     |

**Exceptions**

|                        |                                                                                                                                                                                                                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>         | A timeout occurred during IIOP processing.                                                                                                                                                                                                                                                                                                                     |

| <i>OpNotAllowed</i>    | Not logged on.                                  |
| <i>OpNotSupported</i>  | When called for other boards than the mainboard |
| <i>OperationFailed</i> |                                                 |

### Version

Mainboard support added in release 10.10

#### 8.41.4.7 IP\_RouteList\_t DCM::DeviceControl::RouteEntryGetL ( in IPS\_Ref\_t *RefPhys* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the routing entries for the specified board and port.

### Parameters

|    |                |                                                                                                                   |
|----|----------------|-------------------------------------------------------------------------------------------------------------------|
| in | <i>RefPhys</i> | Board and port number to get information from. Specify 0xffff for PortNr to retrieve information about all ports. |
|----|----------------|-------------------------------------------------------------------------------------------------------------------|

### Returns

RouteList Requested route list.

### Exceptions

|                       |                                            |
|-----------------------|--------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing. |
| <i>OpNotSucceeded</i> | RefPhys is not valid.                      |
| <i>OpNotAllowed</i>   | Not logged on.                             |
| <i>OpNotSupported</i> | When called for a non-GbE board.           |

#### 8.41.4.8 void DCM::DeviceControl::RouteEntryIPv6AddL ( in IPS\_Ref\_t *RefPhys*, in IP\_RouteList\_t *RouteList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Add or replace static routes on the specified board and port.

### Parameters

|    |                  |                        |
|----|------------------|------------------------|
| in | <i>RefPhys</i>   | Board and port number. |
| in | <i>RouteList</i> | List with routes.      |

**Exceptions**

|                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <i>OpNotSupported</i> | When called for other boards than a GbE-I/O board and the mainboard                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Version**

Mainboard support added in release 5.1

**Note**

RouteList[i].Static is ignored - all entries are treated as static  
 RouteList[i].RefPhys.BoardNr must match RefPhys.BoardNr  
 To add a default gateway x:x:x:x:x:x, specify RouteList[i].IP\_Addr = ::, RouteList[i].SubNetMask = :: and Gateway = x:x:x:x:x:x .  
 If RouteList[i].RefPhys.PortNr == 0xffff, then routing entry i is applied to all ports of the specified board. The route will only be added if RouteList[i].SubNetMask matches the subnet of the port exactly !  
 !!!! EXPERIMENTAL - DO NOT USE !!!!

**8.41.4.9** void DCM::DeviceControl::RouteEntryIPv6DeleteL ( in IPS\_Ref\_t *RefPhys*, in IP\_RouteList\_t *RouteList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Delete a list of routes.

Only static routes will be deleted.

**Parameters**

|    |                  |                                                       |
|----|------------------|-------------------------------------------------------|
| in | <i>RefPhys</i>   | Specifies BoardNr & PortNr to delete the routes from. |
| in | <i>RouteList</i> | List with routes.                                     |

**Exceptions**

|                       |                                                                                                                                                                                                                                                                                                                                                        |

| <i>OpNotSupported</i> | When called for a non-GbE board.                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Note**

RouteList[i].Static is ignored - all entries are treated as static

## 8.42 END\_DEVICE

This module contains types, enums and methods related to end devices.

Collaboration diagram for END\_DEVICE:

### Classes

- struct [DCM::DeviceControl::EndDeviceEntry\\_t](#)

### Typedefs

- typedef sequence < EndDeviceEntry\_t > [DCM::DeviceControl::EndDeviceList\\_t](#)  
A sequence of [EndDeviceEntry\\_t](#).

### Functions

- EndDeviceList\_t [DCM::DeviceControl::EndDeviceEntryGetL](#) (in IPS\_Ref\_t RefPhys) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
Get a list of end devices.

#### 8.42.1 Detailed Description

This module contains types, enums and methods related to end devices.

#### 8.42.2 Typedef Documentation

##### 8.42.2.1 typedef sequence<EndDeviceEntry\_t> DCM::DeviceControl::EndDeviceList\_t

A sequence of [EndDeviceEntry\\_t](#).

Definition at line 19041 of file DCM.idl.

#### 8.42.3 Function Documentation

##### 8.42.3.1 EndDeviceList\_t DCM::DeviceControl::EndDeviceEntryGetL ( in IPS\_Ref\_t RefPhys ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get a list of end devices.

**Parameters**

|                 |                |                                                                                                         |
|-----------------|----------------|---------------------------------------------------------------------------------------------------------|
| <code>in</code> | <i>RefPhys</i> | Specifies the Port for which to get the EndDevices. Wildcard is allowed. RefPhys can be a virtual port. |
|-----------------|----------------|---------------------------------------------------------------------------------------------------------|

**Returns**

EndDeviceList\_t List with end devices.

**Exceptions**

|                       |                                                                                          |
|-----------------------|------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When called for other boards than GbE ones (Main, ASI,...).                              |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"><li>Invalid references (RefPhys).</li></ul> |

## 8.43 FEC

This contains types, enums and methods to configure the FEC streams of the device.

Collaboration diagram for FEC:

### Modules

- [FEC Decoder](#)

*This contains types, enums and methods to configure Hitless Merge over separate ports.*

### 8.43.1 Detailed Description

This contains types, enums and methods to configure the FEC streams of the device.

## 8.44 FEC Decoder

This contains types, enums and methods to configure the FEC decoder part of the device.

Collaboration diagram for FEC Decoder:

### Classes

- struct [DCM::DeviceControl::FEC\\_Dec\\_Setting\\_t](#)  
*FEC decoder settings.*
- struct [DCM::DeviceControl::InTS\\_FEC\\_Dec\\_Setting\\_t](#)  
*FEC encoder settings for specific TS.*
- struct [DCM::DeviceControl::InTS\\_FEC\\_Dec\\_DefRuleSetting\\_t](#)  
*FEC decoder default rule settings.*
- struct [DCM::DeviceControl::FEC\\_Dec\\_Statistics\\_t](#)  
*FEC decoder statistics.*
- struct [DCM::DeviceControl::InTS\\_FEC\\_Dec\\_Statistics\\_t](#)  
*FEC decoder statistics for specific TS.*
- struct [DCM::DeviceControl::FEC\\_Dec\\_Status\\_t](#)  
*FEC decoder status.*
- struct [DCM::DeviceControl::InTS\\_FEC\\_Dec\\_Status\\_t](#)  
*FEC decoder status for specific TS.*

### Typedefs

- typedef sequence < InTS\_FEC\_Dec\_Setting\_t > [DCM::DeviceControl::InTS\\_FEC\\_Dec\\_Setting\\_List\\_t](#)  
*A sequence of [InTS\\_FEC\\_Dec\\_Setting\\_t](#) entries.*
- typedef sequence < InTS\_FEC\_Dec\_Statistics\_t > [DCM::DeviceControl::InTS\\_FEC\\_Dec\\_Statistics\\_List\\_t](#)  
*A sequence of [InTS\\_FEC\\_Dec\\_Statistics\\_t](#) entries.*
- typedef sequence < InTS\_FEC\_Dec\_Status\_t > [DCM::DeviceControl::InTS\\_FEC\\_Dec\\_Status\\_List\\_t](#)  
*A sequence of [InTS\\_FEC\\_Dec\\_Status\\_t](#) entries.*

## Enumerations

- enum `DCM::DeviceControl::eFECDecMode` { `DCM::DeviceControl::eFEC_DEC_DISABLED`, `DCM::DeviceControl::eFEC_DEC_1D_MODE`, `DCM::DeviceControl::eFEC_DEC_2D_MODE`, `DCM::DeviceControl::eFEC_RTP_REORDER_ONLY` }

*Input mode for FEC decoder.*

- enum `DCM::DeviceControl::eFECIncrScheme` { `DCM::DeviceControl::eUDP_OFFSET`, `DCM::DeviceControl::eIP_OFFSET` }

*FEC stream's increment scheme for default settings (increase IP or UDP)*

## Functions

- void `DCM::DeviceControl::InTS_FEC_Dec_SetL` (in `IPS_Ref_t RefPhys`, in `InTS_FEC_Dec_Setting_List_t InTS_FEC_Dec_Setting_List`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

*Set FEC decoder settings for some input TS.*

- void `DCM::DeviceControl::InTS_FEC_Dec_GetL` (in `IPS_Ref_t RefPhys`, in `IPS_RefTS_List_t RefTsList`, out `InTS_FEC_Dec_Setting_List_t InTS_FEC_Dec_Setting_List`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get FEC decoder settings for some input TS.*

- void `DCM::DeviceControl::InTS_FEC_Dec_DeL` (in `IPS_Ref_t RefPhys`, in `IPS_RefTS_List_t RefTsList`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

*Delete the FEC decoder settings for some input TS.*

- void `DCM::DeviceControl::SetDefaultRule_FEC_Dec` (in `IPS_Ref_t RefPhys`, in `InTS_FEC_Dec_DefRuleSetting_t FEC_Dec_DefRuleSetting`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Set FEC Dec default rule settings to be used for all InTS without FEC settings Defaults are attached to a (logical) port.*

- void `DCM::DeviceControl::GetDefaultRule_FEC_Dec` (in `IPS_Ref_t RefPhys`, out `InTS_FEC_Dec_DefRuleSetting_t FEC_Dec_DefRuleSetting`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get FEC Dec default rule settings to be used for all InTS without FEC settings Defaults are attached to a (logical) port.*

- void `DCM::DeviceControl::InTS_FEC_Dec_Get_Statistics` (in `IPS_Ref_t RefPhys`, in `IPS_RefTS_List_t RefTsList`, out `InTS_FEC_Dec_Statistics_List_t InTS_FEC_Dec_Statistics_List`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get FEC Dec statistics for a list of input TS.*

- void `DCM::DeviceControl::InTS_FEC_Dec_Reset_Statistics` (in `IPS_Ref_t RefPhys`, in `IPS_RefTS_List_t RefTsList`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Reset the FEC Dec statistics for a list of input TS.*

- void `DCM::DeviceControl::InTS_FEC_Dec_Get_Status` (in `IPS_Ref_t RefPhys`, in `IPS_RefTS_List_t RefTsList`, out `InTS_FEC_Dec_Status_List_t InTS_FEC_Dec_Status_List`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the FEC Dec status for a list of input TS.*

- void `DCM::DeviceControl::RTP_ReorderBufferSize_Set` (in unsigned short Board, in unsigned long Size) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Set the RTP reorder buffer size for all input TSs configured in RTP reorder mode.*

- void `DCM::DeviceControl::RTP_ReorderBufferSize_Get` (in unsigned short Board, out unsigned long Size) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the RTP reorder buffer size (of all input TSs configured in RTP reorder mode)*

### 8.44.1 Detailed Description

This contains types, enums and methods to configure the FEC decoder part of the device.

### 8.44.2 Typedef Documentation

#### 8.44.2.1 typedef sequence<InTS\_FEC\_Dec\_Setting\_t> DCM::DeviceControl::InTS\_FEC\_Dec\_Setting\_List\_t

A sequence of [InTS\\_FEC\\_Dec\\_Setting\\_t](#) entries.

Definition at line 19135 of file DCM.idl.

#### 8.44.2.2 typedef sequence< InTS\_FEC\_Dec\_Statistics\_t > DCM::DeviceControl::InTS\_FEC\_Dec\_Statistics\_List\_t

A sequence of [InTS\\_FEC\\_Dec\\_Statistics\\_t](#) entries.

Definition at line 19172 of file DCM.idl.

#### 8.44.2.3 typedef sequence< InTS\_FEC\_Dec\_Status\_t > DCM::DeviceControl::InTS\_FEC\_Dec\_Status\_List\_t

A sequence of [InTS\\_FEC\\_Dec\\_Status\\_t](#) entries.

Definition at line 19195 of file DCM.idl.

### 8.44.3 Enumeration Type Documentation

#### 8.44.3.1 enum DCM::DeviceControl::eFECDecMode

Input mode for FEC decoder.

Enumerator:

*eFEC\_DEC\_DISABLED* no FEC decoding  
*eFEC\_DEC\_1D\_MODE* single FEC decoding mode  
*eFEC\_DEC\_2D\_MODE* dual FEC decoding mode  
*eFEC\_RTP\_REORDER\_ONLY* perform only packet reordering

Definition at line 19110 of file DCM.idl.

#### 8.44.3.2 enum DCM::DeviceControl::eFECIncrScheme

FEC streamslicrement scheme for default settings (increase IP or UDP)

Enumerator:

*eUDP\_OFFSET* increase UDP port for row/col FEC  
*eIP\_OFFSET* increase IP address for row/col FEC

Definition at line 19138 of file DCM.idl.

## 8.44.4 Function Documentation

**8.44.4.1** void DCM::DeviceControl::GetDefaultRule\_FEC\_Dec ( in IPS\_Ref\_t *RefPhys*, out InTS\_FEC\_Dec\_DefRuleSetting\_t *FEC\_Dec\_DefRuleSetting* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get FEC Dec default rule settings to be used for all InTS without FEC settings Defaults are attached to a (logical) port.

## Parameters

|     |                               |                                                    |
|-----|-------------------------------|----------------------------------------------------|
| in  | <i>RefPhys</i>                | The BoardNr and PortNr you want information about. |
| out | <i>FEC_Dec_DefRuleSetting</i> | The defaults                                       |

## Exceptions

|                       |                                                                                                                    |
|-----------------------|--------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When called for other boards than GbE ones or no FEC board present.                                                |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>• <i>RefPhys</i> does not exist (or is a backup port)</li> </ul> |

**8.44.4.2** void DCM::DeviceControl::InTS\_FEC\_Dec\_DeL ( in IPS\_Ref\_t *RefPhys*, in IPS\_RefTS\_List\_t *RefTsList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

Delete the FEC decoder settings for some input TS.

## Parameters

|    |                  |                                                                  |
|----|------------------|------------------------------------------------------------------|
| in | <i>RefPhys</i>   | The BoardNr and PortNr of which parameters need to be changed.   |
| in | <i>RefTsList</i> | List of Referenced input TS for which to delete the FEC settings |

## Exceptions

|                       |                                                                                                                                                                          |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When board is not a Gbe board or an IP Video Gateway board, or when no FEC board present on a GbE board.                                                                 |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>• <i>RefPhys</i> does not exist (or is a backup port)</li> <li>• <i>RefTs</i> does not match <i>RefPhys</i></li> </ul> |
| <i>LicenseError</i>   | When FEC is default enabled and no more FEC licenses available anymore.                                                                                                  |

**8.44.4.3** void DCM::DeviceControl::InTS\_FEC\_Dec\_Get\_Statistics ( in IPS\_Ref\_t *RefPhys*, in IPS\_RefTS\_List\_t *RefTsList*, out InTS\_FEC\_Dec\_Statistics\_List\_t *InTS\_FEC\_Dec\_Statistics\_List* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get FEC Dec statistics for a list of input TS.

**Parameters**

|    |                                     |                                                    |
|----|-------------------------------------|----------------------------------------------------|
| in | <i>RefPhys</i>                      | The BoardNr and PortNr you want information about. |
| in | <i>RefTsList</i>                    | Identifies the input TS.                           |
| in | <i>InTS_FEC_Dec_Statistics_List</i> | List of RefTs/ FecDecStat pairs                    |

**Exceptions**

|                       |                                                                                                          |
|-----------------------|----------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When board is not a Gbe board or an IP Video Gateway board, or when no FEC board present on a GbE board. |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>• RefTSIn does not exist</li> </ul>                    |

**8.44.4.4** void DCM::DeviceControl::InTS\_FEC\_Dec\_Get\_Status ( in IPS\_Ref\_t *RefPhys*, in IPS\_RefTS\_List\_t *RefTsList*, out InTS\_FEC\_Dec\_Status\_List\_t *InTS\_FEC\_Dec\_Status\_List* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the FEC Dec status for a list of input TS.

**Parameters**

|    |                                 |                                                    |
|----|---------------------------------|----------------------------------------------------|
| in | <i>RefPhys</i>                  | The BoardNr and PortNr you want information about. |
| in | <i>RefTsList</i>                | Identifies the input TS.                           |
| in | <i>InTS_FEC_Dec_Status_List</i> |                                                    |

**Exceptions**

|                       |                                                                                                                               |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When board is not a Gbe board or an IP Video Gateway board, or when no FEC board present on a GbE board.                      |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>• RefTSIn does not exist</li> <li>• RefTs does not match RefPhys</li> </ul> |

**8.44.4.5** void DCM::DeviceControl::InTS\_FEC\_Dec\_GetL ( in IPS\_Ref\_t *RefPhys*, in IPS\_RefTS\_List\_t *RefTsList*, out InTS\_FEC\_Dec\_Setting\_List\_t *InTS\_FEC\_Dec\_Setting\_List* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get FEC decoder settings for some input TS.

**Parameters**

|     |                                  |                                                                                                               |
|-----|----------------------------------|---------------------------------------------------------------------------------------------------------------|
| in  | <i>RefPhys</i>                   | The BoardNr and PortNr you want information about.                                                            |
| in  | <i>RefTsList</i>                 | List of Referenced input TS for which to return the FEC Dec Settings. Empty list=all InTs attached to RefPhys |
| out | <i>InTS_FEC_Dec_Setting_List</i> | List of RefTsIn/ FecDecSet pairs                                                                              |

**Exceptions**

|                       |                                                                                                                                                     |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When board is not a Gbe board or an IP Video Gateway board, or when no FEC board present on a GbE board.                                            |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>• RefPhys does not exist (or is a backup port)</li> <li>• RefTs does not match RefPhys</li> </ul> |

**8.44.4.6** void DCM::DeviceControl::InTS\_FEC\_Dec\_Reset\_Statistics ( in IPS\_Ref\_t *RefPhys*, in IPS\_RefTs\_List\_t *RefTsList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Reset the FEC Dec statistics for a list of input TS.

**Parameters**

|    |                  |                                                    |
|----|------------------|----------------------------------------------------|
| in | <i>RefPhys</i>   | The BoardNr and PortNr you want information about. |
| in | <i>RefTsList</i> | Identifies the input TS.                           |

**Exceptions**

|                       |                                                                                                          |
|-----------------------|----------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When board is not a Gbe board or an IP Video Gateway board, or when no FEC board present on a GbE board. |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>• RefTSIn does not exist</li> </ul>                    |

**8.44.4.7** void DCM::DeviceControl::InTS\_FEC\_Dec\_SetL ( in IPS\_Ref\_t *RefPhys*, in InTS\_FEC\_Dec\_Setting\_List\_t *InTS\_FEC\_Dec\_Setting\_List* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

Set FEC decoder settings for some input TS.

**Parameters**

|    |                                  |                                                                |
|----|----------------------------------|----------------------------------------------------------------|
| in | <i>RefPhys</i>                   | The BoardNr and PortNr of which parameters need to be changed. |
| in | <i>InTS_FEC_Dec_Setting_List</i> | List of RefTsIn/ FecDecSet pairs                               |

**Exceptions**

|                       |                                                                                                                                                                            |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When board is not a Gbe board or an IP Video Gateway board, or when no FEC board present on a GbE board.                                                                   |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>• RefPhys does not exist (or is a backup port)</li> <li>• <a href="#">InTS_FEC_Dec_Setting_t</a> out of range</li> </ul> |
| <i>LicenseError</i>   | When FEC is enabled and no more FEC licenses available anymore.                                                                                                            |

**8.44.4.8** void DCM::DeviceControl::RTP\_ReorderBufferSize\_Get ( in unsigned short *Board*, out unsigned long *Size* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the RTP reorder buffer size (of all input TSs configured in RTP reorder mode)

#### Parameters

|     |                |                          |
|-----|----------------|--------------------------|
| in  | <i>Board,:</i> | The board number         |
| out | <i>Size,:</i>  | The size of the buffers. |

#### Exceptions

|                       |                                                                     |
|-----------------------|---------------------------------------------------------------------|
| <i>OpNotSupported</i> | When called for other boards than GbE ones or no FEC board present. |
|-----------------------|---------------------------------------------------------------------|

**8.44.4.9** void DCM::DeviceControl::RTP\_ReorderBufferSize\_Set ( in unsigned short *Board*, in unsigned long *Size* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the RTP reorder buffer size for all input TSs configured in RTP reorder mode.

#### Parameters

|    |                |                                                               |
|----|----------------|---------------------------------------------------------------|
| in | <i>Board,:</i> | The board number                                              |
| in | <i>Size,:</i>  | The new size of the buffers. Size must be between 16 and 256. |

#### Exceptions

|                       |                                                                     |
|-----------------------|---------------------------------------------------------------------|
| <i>OpNotSupported</i> | When called for other boards than GbE ones or no FEC board present. |
|-----------------------|---------------------------------------------------------------------|

**8.44.4.10** void DCM::DeviceControl::SetDefaultRule\_FEC\_Dec ( in IPS\_Ref\_t *RefPhys*, in InTS\_FEC\_Dec\_DefRuleSetting\_t *FEC\_Dec\_DefRuleSetting* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set FEC Dec default rule settings to be used for all InTS without FEC settings Defaults are attached to a (logical) port.

#### Parameters

|    |                               |                                                                |
|----|-------------------------------|----------------------------------------------------------------|
| in | <i>RefPhys</i>                | The BoardNr and PortNr of which parameters need to be changed. |
| in | <i>FEC_Dec_DefRuleSetting</i> | The defaults                                                   |

#### Exceptions

|                       |                                                                                                                                                            |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When called for other boards than GbE ones or no FEC board present.                                                                                        |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>• RefPhys does not exist (or is a backup port)</li> <li>• FEC_Dec_DefRuleSetting out of range</li> </ul> |

## 8.45 FEC Encoder

This contains types, enums and methods to configure the FEC encoder part of the device.

Collaboration diagram for FEC Encoder:

### Classes

- struct [DCM::DeviceControl::FEC\\_Enc\\_Setting\\_t](#)  
*FEC encoder settings.*
- struct [DCM::DeviceControl::OutTS\\_FEC\\_Enc\\_Setting\\_t](#)  
*FEC encoder settings for specific TS.*
- struct [DCM::DeviceControl::FEC\\_Enc\\_Setting\\_V2\\_t](#)  
*FEC encoder settings.*
- struct [DCM::DeviceControl::OutTS\\_FEC\\_Enc\\_Setting\\_V2\\_t](#)  
*FEC encoder settings for specific TS.*
- struct [DCM::DeviceControl::OutTS\\_FEC\\_Enc\\_DefSetting\\_t](#)  
*Default FEC encoder settings (to be applied for new TS's)*
- struct [DCM::DeviceControl::FEC\\_Enc\\_ErrorGen\\_t](#)  
*FEC error generation parameters.*
- struct [DCM::DeviceControl::OutTS\\_FEC\\_Enc\\_ErrorGen\\_t](#)  
*FEC error generation for specific TS.*
- struct [DCM::DeviceControl::FEC\\_Enc\\_Overhead\\_t](#)  
*Bitrate overhead, due to FEC encoding.*
- struct [DCM::DeviceControl::OutTS\\_FEC\\_Enc\\_Overhead\\_t](#)  
*Bitrate overhead for specific TS.*

### Typedefs

- typedef sequence < [OutTS\\_FEC\\_Enc\\_Setting\\_t](#) > [DCM::DeviceControl::OutTS\\_FEC\\_Enc\\_Setting\\_List\\_t](#)  
*A sequence of [OutTS\\_FEC\\_Enc\\_Setting\\_t](#) entries.*
- typedef sequence < [OutTS\\_FEC\\_Enc\\_Setting\\_V2\\_t](#) > [DCM::DeviceControl::OutTS\\_FEC\\_Enc\\_Setting\\_V2\\_List\\_t](#)  
*A sequence of [OutTS\\_FEC\\_Enc\\_Setting\\_V2\\_t](#) entries.*
- typedef sequence < [OutTS\\_FEC\\_Enc\\_Overhead\\_t](#) > [DCM::DeviceControl::OutTS\\_FEC\\_Enc\\_Overhead\\_List\\_t](#)  
*A sequence of [OutTS\\_FEC\\_Enc\\_Overhead\\_t](#) entries.*

## Enumerations

- enum `DCM::DeviceControl::eFECEncMode` { `DCM::DeviceControl::eFEC_ENC_DISABLED`, `DCM::DeviceControl::eFEC_ENC_1D_MODE`, `DCM::DeviceControl::eFEC_ENC_2D_MODE` }

*Output mode for FEC encoder.*

- enum `DCM::DeviceControl::eFECSendingArrangement` { `DCM::DeviceControl::ePRO_MPEG_COP3_ANNEX_B`, `DCM::DeviceControl::ePRO_MPEG_COP3_ANNEX_A` }

*FEC linearity for encoder.*

- enum `DCM::DeviceControl::eFECErrorMode` { `DCM::DeviceControl::eFEC_ERROR_GEN_DISABLED`, `DCM::DeviceControl::eFEC_ERROR_GEN_SINGLE_BURST`, `DCM::DeviceControl::eFEC_ERROR_GEN_CONTINUOUS` }

*Mode for FEC error generation.*

## Functions

- void `DCM::DeviceControl::OutTS_FEC_Enc_SetL` (in `IPS_Ref_t RefPhys`, in `OutTS_FEC_Enc_Setting_List_t OutTS_FEC_Enc_Setting_List`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

*Set FEC encoder settings for some output TS.*

- void `DCM::DeviceControl::OutTS_FEC_Enc_GetL` (in `IPS_Ref_t RefPhys`, in `IPS_RefTS_List_t RefTsList`, out `OutTS_FEC_Enc_Setting_List_t OutTS_FEC_Enc_Setting_List`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get FEC encoder settings for some output TS.*

- void `DCM::DeviceControl::OutTS_FEC_Enc_V2_SetL` (in `IPS_Ref_t RefPhys`, in `OutTS_FEC_Enc_Setting_V2_List_t OutTS_FEC_Enc_Setting_V2_List`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

*For IPGW.*

- void `DCM::DeviceControl::OutTS_FEC_Enc_V2_GetL` (in `IPS_Ref_t RefPhys`, in `IPS_RefTS_List_t RefTsList`, out `OutTS_FEC_Enc_Setting_V2_List_t OutTS_FEC_Enc_Setting_V2_List`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)
- void `DCM::DeviceControl::SetDefault_FEC_Enc` (in `IPS_Ref_t RefPhys`, in `OutTS_FEC_Enc_DefSetting_t FEC_Enc_DefSetting`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Set default FEC Enc settings to be used for new OutTS.*

- void `DCM::DeviceControl::GetDefault_FEC_Enc` (in `IPS_Ref_t RefPhys`, out `OutTS_FEC_Enc_DefSetting_t FEC_Enc_DefSetting`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get default FEC Enc settings that are used for new OutTS.*

- void `DCM::DeviceControl::SetErrorGen_FEC_Enc` (in `IPS_RefTS_t RefTS`, in `eFECErrorMode - ErrorMode`, in unsigned short `NrGoodPackets`, in unsigned short `NrErrorPackets`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Set FEC Error generator mode for OutTS.*

- void `DCM::DeviceControl::SetErrorGen_FEC_Enc_V2` (in `IPS_RefTS_t RefTS`, in `OutTS_FEC_Enc_ErrorGen_t OutTS_FEC_Enc_ErrorGen`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Set FEC Error generator mode for OutTS.*

- void `DCM::DeviceControl::GetErrorGen_FEC_Enc` (in `IPS_Ref_t RefPhys`, out `OutTS_FEC_Enc_ErrorGen_t OutTS_FEC_Enc_ErrorGen`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the active FEC Error generator mode.*

- void [DCM::DeviceControl::OutTS\\_FEC\\_Enc\\_Overhead\\_GetL](#) (in [IPS\\_Ref\\_t](#) RefPhys, in [IPS\\_RefTS\\_List\\_t](#) RefTsList, out [OutTS\\_FEC\\_Enc\\_Overhead\\_List\\_t](#) OutTS\_FEC\_Enc\_Overhead\_List) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get FEC encoder Row/Col overhead for some OutTS.*

### 8.45.1 Detailed Description

This contains types, enums and methods to configure the FEC encoder part of the device.

### 8.45.2 Typedef Documentation

#### 8.45.2.1 typedef sequence<[OutTS\\_FEC\\_Enc\\_Overhead\\_t](#)> [DCM::DeviceControl::OutTS\\_FEC\\_Enc\\_Overhead\\_List\\_t](#)

A sequence of [OutTS\\_FEC\\_Enc\\_Overhead\\_t](#) entries.

Definition at line 19466 of file DCM.idl.

#### 8.45.2.2 typedef sequence<[OutTS\\_FEC\\_Enc\\_Setting\\_t](#)> [DCM::DeviceControl::OutTS\\_FEC\\_Enc\\_Setting\\_List\\_t](#)

A sequence of [OutTS\\_FEC\\_Enc\\_Setting\\_t](#) entries.

Definition at line 19384 of file DCM.idl.

#### 8.45.2.3 typedef sequence<[OutTS\\_FEC\\_Enc\\_Setting\\_V2\\_t](#)> [DCM::DeviceControl::OutTS\\_FEC\\_Enc\\_Setting\\_V2\\_List\\_t](#)

A sequence of [OutTS\\_FEC\\_Enc\\_Setting\\_V2\\_t](#) entries.

Definition at line 19405 of file DCM.idl.

### 8.45.3 Enumeration Type Documentation

#### 8.45.3.1 enum [DCM::DeviceControl::eFECEncMode](#)

Output mode for FEC encoder.

Enumerator:

***eFEC\_ENC\_DISABLED*** no FEC encoding  
***eFEC\_ENC\_1D\_MODE*** single FEC stream mode  
***eFEC\_ENC\_2D\_MODE*** dual FEC stream mode

Definition at line 19351 of file DCM.idl.

#### 8.45.3.2 enum [DCM::DeviceControl::eFECErrorMode](#)

Mode for FEC error generation.

Enumerator:

***eFEC\_ERROR\_GEN\_DISABLED*** no error generation  
***eFEC\_ERROR\_GEN\_SINGLE\_BURST*** generate single burst error

***eFEC\_ERROR\_GEN\_CONTINUOUS*** generate continuous error

Definition at line 19428 of file DCM.idl.

#### 8.45.3.3 enum DCM::DeviceControl::eFECSendingArrangement

FEC linearity for encoder.

Enumerator:

***ePRO\_MPEG\_COP3\_ANNEX\_B*** offset scheme as in annex B of Pro MPEG COP 3 standard

***ePRO\_MPEG\_COP3\_ANNEX\_A*** offset scheme as in annex A of Pro MPEG COP 3 standard

Definition at line 19359 of file DCM.idl.

#### 8.45.4 Function Documentation

**8.45.4.1 void DCM::DeviceControl::GetDefault\_FEC\_Enc ( in IPS\_Ref\_t *RefPhys*, out OutTS\_FEC\_Enc\_DefSetting\_t *FEC\_Enc\_DefSetting* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)**

Get default FEC Enc settings that are used for new OutTS.

Defaults are attached to a (logical) port.

##### Parameters

|     |                           |                                            |
|-----|---------------------------|--------------------------------------------|
| in  | <i>RefPhys</i>            | identifies the port (no wildcards allowed) |
| out | <i>FEC_Enc_DefSetting</i> | the default settings for FEC encoder       |

##### Exceptions

|                       |                                                                                                                    |
|-----------------------|--------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When called for other boards than GbE ones (Main, ASI, ...)                                                        |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>• <i>RefPhys</i> does not exist (or is a backup port)</li> </ul> |

**8.45.4.2 void DCM::DeviceControl::GetErrorGen\_FEC\_Enc ( in IPS\_Ref\_t *RefPhys*, out OutTS\_FEC\_Enc\_ErrorGen\_t *OutTS\_FEC\_Enc\_ErrorGen* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)**

Get the active FEC Error generator mode.

##### Parameters

|     |                               |                                                |
|-----|-------------------------------|------------------------------------------------|
| in  | <i>RefPhys</i>                | Board and port number. Port number is ignored. |
| out | <i>OutTS_FEC_Enc_ErrorGen</i> | The FEC error generation parameters            |

**Exceptions**

|                       |                                                                                                          |
|-----------------------|----------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When board is not a Gbe board or an IP Video Gateway board, or when no FEC board present on a GbE board. |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>• No FEC board is present</li> </ul>                   |

**8.45.4.3** void DCM::DeviceControl::OutTS\_FEC\_Enc\_GetL ( in IPS\_Ref\_t *RefPhys*, in IPS\_RefTS\_List\_t *RefTsList*, out OutTS\_FEC\_Enc\_Setting\_List\_t *OutTS\_FEC\_Enc\_Setting\_List* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get FEC encoder settings for some output TS.

**Parameters**

|     |                                   |                                                                                                                   |
|-----|-----------------------------------|-------------------------------------------------------------------------------------------------------------------|
| in  | <i>RefPhys</i>                    | the port the OutTS are attached to                                                                                |
| in  | <i>RefTsList</i>                  | list of references of OutTS for which to return the FEC ENC Settings (Empty list = all OutTS attached to RefPhys) |
| out | <i>OutTS_FEC_Enc_Setting_List</i> | list of FeTSOut/FecEncSett pairs                                                                                  |

**Exceptions**

|                       |                                                                                                                                                        |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When board is not a Gbe board or an IP Video Gateway board, or when no FEC board present on a GbE board.                                               |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>• RefPhys does not exist (or is a backup port)</li> <li>• RefTSOut does not match RefPhys</li> </ul> |

**8.45.4.4** void DCM::DeviceControl::OutTS\_FEC\_Enc\_Overhead\_GetL ( in IPS\_Ref\_t *RefPhys*, in IPS\_RefTS\_List\_t *RefTsList*, out OutTS\_FEC\_Enc\_Overhead\_List\_t *OutTS\_FEC\_Enc\_Overhead\_List* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get FEC encoder Row/Col overhead for some OutTS.

**Parameters**

|    |                                    |                                                                                                                    |
|----|------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| in | <i>RefPhys</i>                     | the port the OutTS are attached to                                                                                 |
| in | <i>RefTsList</i>                   | list of references of OutTS for which to return the FEC ENC overhead. (Empty list = all OutTS attached to RefPhys) |
| in | <i>OutTS_FEC_Enc_Overhead_List</i> | list of RefTSOut/FecEncOverhead pairs                                                                              |

**Exceptions**

|                       |                                                                                                          |
|-----------------------|----------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When board is not a Gbe board or an IP Video Gateway board, or when no FEC board present on a GbE board. |
|-----------------------|----------------------------------------------------------------------------------------------------------|

|                       |                                                                                                                                                     |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>• RefPhys does not exist (or is a backup port)</li> <li>• RefTs does not match RefPhys</li> </ul> |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|

**8.45.4.5** void DCM::DeviceControl::OutTS\_FEC\_Enc\_SetL ( in IPS\_Ref\_t *RefPhys*, in OutTS\_FEC\_Enc\_Setting\_List\_t *OutTS\_FEC\_Enc\_Setting\_List* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

Set FEC encoder settings for some output TS.

#### Parameters

|    |                                   |                                    |
|----|-----------------------------------|------------------------------------|
| in | <i>RefPhys</i>                    | the port the OutTS are attached to |
| in | <i>OutTS_FEC_Enc_Setting_List</i> | list of RefTSOut/FecEncSett pairs  |

#### Exceptions

|                       |                                                                                                                                                                                                                                                                                                              |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When board is not a Gbe board or an IP Video Gateway board, or when no FEC board present on a GbE board.                                                                                                                                                                                                     |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>• RefPhys does not exist (or is a backup port)</li> <li>• RefTSOut does not match RefPhys</li> <li>• FEC_Enc_Settings out of range</li> <li>• Enabling FEC encoding while RTP is disabled</li> <li>• Enabling FEC encoding while VBR is enabled</li> </ul> |
| <i>LicenseError</i>   | When FEC is enabled and no more FEC licenses available anymore.                                                                                                                                                                                                                                              |

**8.45.4.6** void DCM::DeviceControl::OutTS\_FEC\_Enc\_V2\_GetL ( in IPS\_Ref\_t *RefPhys*, in IPS\_RefTS\_List\_t *RefTsList*, out OutTS\_FEC\_Enc\_Setting\_V2\_List\_t *OutTS\_FEC\_Enc\_Setting\_V2\_List* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

**8.45.4.7** void DCM::DeviceControl::OutTS\_FEC\_Enc\_V2\_SetL ( in IPS\_Ref\_t *RefPhys*, in OutTS\_FEC\_Enc\_Setting\_V2\_List\_t *OutTS\_FEC\_Enc\_Setting\_V2\_List* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, LicenseError)

For IPGW.

Similar to the "V1" but without socket parameters. These socket parameters are then configured with [OutputFecGBE\\_ChangeL\(\)](#).

**Version**

Release 8.9

**8.45.4.8** void DCM::DeviceControl::SetDefault\_FEC\_Enc ( in IPS\_Ref\_t *RefPhys*, in OutTS\_FEC\_Enc\_DefSetting\_t *FEC\_Enc\_DefSetting* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set default FEC Enc settings to be used for new OutTS.

Defaults are attached to a (logical) port.

**Parameters**

|    |                           |                                            |
|----|---------------------------|--------------------------------------------|
| in | <i>RefPhys</i>            | identifies the port (no wildcards allowed) |
| in | <i>FEC_Enc_DefSetting</i> | the default settings for FEC encoder       |

**Exceptions**

|                       |                                                                                                                                                                                                                                                                                                                   |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When called for other boards than GbE ones (Main, ASI, ...)                                                                                                                                                                                                                                                       |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>• <i>RefPhys</i> does not exist (or is a backup port)</li> <li>• <i>FEC_Enc_DefSetting</i> out of range</li> <li>• Default enabling FEC encoding while RTP is default disabled</li> <li>• Default enabling FEC encoding while VBR is default enabled</li> </ul> |

**8.45.4.9** void DCM::DeviceControl::SetErrorGen\_FEC\_Enc ( in IPS\_RefTS\_t *RefTS*, in eFECErrorMode *ErrorMode*, in unsigned short *NrGoodPackets*, in unsigned short *NrErrorPackets* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set FEC Error generator mode for OutTS.

**Parameters**

|    |                       |                                              |
|----|-----------------------|----------------------------------------------|
| in | <i>RefTS</i>          | the location of the TS (board, port and ref) |
| in | <i>ErrorMode</i>      | the error mode for FEC error generator       |
| in | <i>NrGoodPackets</i>  | number of good packets (range 1..65536)      |
| in | <i>NrErrorPackets</i> | number of error packets (range 1..63)        |

**Remarks**

This setting is not saved to flash.

Starting error generation on another TS will automatically stop the pending error generation.

**Exceptions**

|                       |                                                                                                                                                                                                                               |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When called for other boards than GbE ones (Main, ASI, ...)                                                                                                                                                                   |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>• RefPhys does not exist (or is a backup port)</li> <li>• FECErrorMode out of range</li> <li>• NrGoodPackets out of range</li> <li>• NrErrorPackets out of range</li> </ul> |

**8.45.4.10** void DCM::DeviceControl::SetErrorGen\_FEC\_Enc\_V2 ( in IPS\_RefTS\_t *RefTS*,  
 in OutTS\_FEC\_Enc\_ErrorGen\_t *OutTS\_FEC\_Enc\_ErrorGen* ) raises (TimeOut,  
 OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set FEC Error generator mode for OutTS.

V2 for [DCM](#) Gateway.

**Parameters**

|    |                               |                                              |
|----|-------------------------------|----------------------------------------------|
| in | <i>RefTS</i>                  | the location of the TS (board, port and ref) |
| in | <i>OutTS_FEC_Enc_ErrorGen</i> | The FEC error generation parameters          |

**Remarks**

This setting is not saved to flash.

Starting error generation on another TS will automatically stop the pending error generation.

**Exceptions**

|                       |                                                                                                                                                                                                                               |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When board is not a Gbe board or an IP Video Gateway board, or when no FEC board present on a GbE board.                                                                                                                      |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>• RefPhys does not exist (or is a backup port)</li> <li>• FECErrorMode out of range</li> <li>• NrGoodPackets out of range</li> <li>• NrErrorPackets out of range</li> </ul> |

## 8.46 Hitless merge over separate ports

This contains types, enums and methods to configure Hitless Merge over separate ports.

Collaboration diagram for Hitless merge over separate ports:

### Classes

- struct [DCM::DeviceControl::HitlessMergeSetting\\_t](#)  
*Hitless merge input TS settings.*
- struct [DCM::DeviceControl::InTS\\_HitlessMergeSetting\\_t](#)  
*Hitless merge settings for specific TS.*

### Typedefs

- typedef sequence < [InTS\\_HitlessMergeSetting\\_t](#) > [DCM::DeviceControl::InTS\\_HitlessMergeSetting-List\\_t](#)  
*A sequence of [InTS\\_HitlessMergeSetting\\_t](#) entries.*

### Enumerations

- enum [DCM::DeviceControl::enHitlessMergeMode\\_t](#) { [DCM::DeviceControl::eHitlessMergeMode\\_FollowBoardDefault](#), [DCM::DeviceControl::eHitlessMergeMode\\_Disabled](#), [DCM::DeviceControl::eHitlessMergeMode\\_EnabledSameUDP\\_Socket](#), [DCM::DeviceControl::eHitlessMergeMode\\_EnabledOtherUDP\\_Socket](#), [DCM::DeviceControl::eHitlessMergeMode\\_Reserved1](#), [DCM::DeviceControl::eHitlessMergeMode\\_Reserved2](#), [DCM::DeviceControl::eHitlessMergeMode\\_Reserved3](#), [DCM::DeviceControl::eHitlessMergeMode\\_Reserved4](#) }  
*Hitless merge mode for input TS.*
- enum [DCM::DeviceControl::enHitlessMergeDefaultMode\\_t](#) { [DCM::DeviceControl::eHitlessMergeDefaultMode\\_Disabled](#), [DCM::DeviceControl::eHitlessMergeDefaultMode\\_EnabledSameUDP\\_Socket](#), [DCM::DeviceControl::eHitlessMergeDefaultMode\\_Reserved1](#), [DCM::DeviceControl::eHitlessMergeDefaultMode\\_Reserved2](#), [DCM::DeviceControl::eHitlessMergeDefaultMode\\_Reserved3](#), [DCM::DeviceControl::eHitlessMergeDefaultMode\\_Reserved4](#) }

### Functions

- void [DCM::DeviceControl::GetHitlessMergeModeEnabled](#) (in unsigned short BoardNr, out boolean HitlessMergeEnabled) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get the Hitless Merge over Separate Port Pairs Enabled setting of an GbE Board.*

- void [DCM::DeviceControl::SetHitlessMergeModeEnabled](#) (in unsigned short BoardNr, in boolean - HitlessMergeEnable) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)  
*Set the Hitless Merge over Separate Port Pairs Enabled setting of an GbE Board.*
- void [DCM::DeviceControl::InTS\\_HitlessMergeSetL](#) (in unsigned short BoardNr, in InTS\_HitlessMergeSettingList\_t InTS\_HitlessMergeSettingList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed, LicenseError)  
*Set Hitless merge settings for some input TS.*
- void [DCM::DeviceControl::InTS\\_HitlessMergeGetL](#) (in IPS\_Ref\_t RefPhys, in IPS\_RefTS\_List\_t RefTsList, out InTS\_HitlessMergeSettingList\_t InTS\_HitlessMergeSettingList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)  
*Get Hitless merge settings for some input TS.*
- void [DCM::DeviceControl::GetDefaultRule\\_HM\\_Mode](#) (in unsigned short BoardNr, out enHitlessMergeDefaultMode\_t HitlessMergeDefaultMode) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get the Hitless Merge default mode for hitless merge input TSs of an GbE Board.*
- void [DCM::DeviceControl::SetDefaultRule\\_HM\\_Mode](#) (in unsigned short BoardNr, in enHitlessMergeDefaultMode\_t HitlessMergeDefaultMode) raises (Timeout, OperationFailed, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)  
*Set the Hitless Merge default mode for hitless merge input TSs of an GbE Board.*
- void [DCM::DeviceControl::GetDefaultRule\\_HM\\_PacketWindow](#) (in unsigned short BoardNr, out unsigned short HitlessMergeDefaultPacketWindow) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get the Hitless Merge default packet window for hitless merge input TSs of an GbE Board.*
- void [DCM::DeviceControl::SetDefaultRule\\_HM\\_PacketWindow](#) (in unsigned short BoardNr, in unsigned short HitlessMergeDefaultPacketWindow) raises (Timeout, OperationFailed, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)  
*Set the Hitless Merge default packet window for hitless merge input TSs of an GbE Board.*

### 8.46.1 Detailed Description

This contains types, enums and methods to configure Hitless Merge over separate ports.

### 8.46.2 Typedef Documentation

#### 8.46.2.1 typedef sequence<InTS\_HitlessMergeSetting\_t> DCM::DeviceControl::InTS\_HitlessMergeSettingList\_t

A sequence of [InTS\\_HitlessMergeSetting\\_t](#) entries.

Definition at line 19688 of file DCM.idl.

### 8.46.3 Enumeration Type Documentation

#### 8.46.3.1 enum DCM::DeviceControl::enHitlessMergeDefaultMode\_t

Enumerator:

- eHitlessMergeDefaultMode\_Disabled* default setting: no hitless merge over separate port pairs
- eHitlessMergeDefaultMode\_EnabledSameUDP\_Socket* default setting: hitless merge over separate port pairs, backup stream has same IP-UDP as main

*eHitlessMergeDefaultMode\_Reserved1* Reserved for future use.

*eHitlessMergeDefaultMode\_Reserved2* Reserved for future use.

*eHitlessMergeDefaultMode\_Reserved3* Reserved for future use.

*eHitlessMergeDefaultMode\_Reserved4* Reserved for future use.

Definition at line 19661 of file DCM.idl.

#### 8.46.3.2 enum DCM::DeviceControl::enHitlessMergeMode\_t

Hitless merge mode for input TS.

Enumerator:

*eHitlessMergeMode\_FollowBoardDefault* follow the board default settings

*eHitlessMergeMode\_Disabled* no hitless merge over separate port pairs

*eHitlessMergeMode\_EnabledSameUDP\_Socket* hitless merge over separate port pairs, backup stream has same IP-UDP as main

*eHitlessMergeMode\_EnabledOtherUDP\_Socket* hitless merge over separate port pairs, backup stream has other IP-UDP as main

*eHitlessMergeMode\_Reserved1* Reserved for future use.

*eHitlessMergeMode\_Reserved2* Reserved for future use.

*eHitlessMergeMode\_Reserved3* Reserved for future use.

*eHitlessMergeMode\_Reserved4* Reserved for future use.

Definition at line 19649 of file DCM.idl.

#### 8.46.4 Function Documentation

**8.46.4.1** void DCM::DeviceControl::GetDefaultRule\_HM\_Mode ( in unsigned short *BoardNr*, out enHitlessMergeDefaultMode\_t *HitlessMergeDefaultMode* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the Hitless Merge default mode for hitless merge input TSs of an GbE Board.

Parameters

|     |                                |                                                           |
|-----|--------------------------------|-----------------------------------------------------------|
| in  | <i>BoardNr</i>                 |                                                           |
| out | <i>HitlessMergeDefaultMode</i> | Indicates the board level default mode for hitless merge. |

Exceptions

|                       |                                              |
|-----------------------|----------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing.   |
| <i>OpNotAllowed</i>   | Not logged on.                               |
| <i>OpNotSupported</i> | When called for non-GbE boards.              |
| <i>OpNotSucceeded</i> | When BoardNr refers to a non-existing board. |

## Version

Release 11.10

**8.46.4.2** void DCM::DeviceControl::GetDefaultRule\_HM\_PacketWindow ( in unsigned short *BoardNr*, out unsigned short *HitlessMergeDefaultPacketWindow* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the Hitless Merge default packet window for hitless merge input TSs of an GbE Board.

## Parameters

|     |                                        |                                                                    |
|-----|----------------------------------------|--------------------------------------------------------------------|
| in  | <i>BoardNr</i>                         |                                                                    |
| out | <i>HitlessMergeDefaultPacketWindow</i> | Indicates the board level default packet window for hitless merge. |

## Exceptions

|                       |                                              |
|-----------------------|----------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing.   |
| <i>OpNotAllowed</i>   | Not logged on.                               |
| <i>OpNotSupported</i> | When called for non-GbE boards.              |
| <i>OpNotSucceeded</i> | When BoardNr refers to a non-existing board. |

## Version

Release 11.10

**8.46.4.3** void DCM::DeviceControl::GetHitlessMergeModeEnabled ( in unsigned short *BoardNr*, out boolean *HitlessMergeEnabled* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the Hitless Merge over Separate Port Pairs Enabled setting of an GbE Board.

## Parameters

|     |                            |                                                                       |
|-----|----------------------------|-----------------------------------------------------------------------|
| in  | <i>BoardNr</i>             |                                                                       |
| out | <i>HitlessMergeEnabled</i> | Indicates whether Hitless Merge over separate ports is enabled or not |

## Exceptions

|                       |                                             |
|-----------------------|---------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing.  |
| <i>OpNotAllowed</i>   | Not logged on.                              |
| <i>OpNotSupported</i> | When called for non-GbE boards.             |
| <i>OpNotSucceeded</i> | When BoardNr refers to a non-existing board |

## Version

Release 11.10

**8.46.4.4** void DCM::DeviceControl::InTS\_HitlessMergeGetL ( in IPS\_Ref\_t *RefPhys*, in IPS\_RefTS\_List\_t *RefTsList*, out InTS\_HitlessMergeSettingList\_t *InTS\_HitlessMergeSettingList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Get Hitless merge settings for some input TS.

## Parameters

|     |                                       |                                                                                                                      |
|-----|---------------------------------------|----------------------------------------------------------------------------------------------------------------------|
| in  | <i>RefPhys</i>                        | The BoardNr and PortNr you want information about.                                                                   |
| in  | <i>RefTsList</i>                      | List of Referenced input TS for which to return the Hitless merge settings. Empty list=all InTs attached to RefPhys. |
| out | <i>InTS_Hitless-MergeSetting-List</i> | List of hitless merge settings for input TSs                                                                         |

## Exceptions

|                        |                                                                                                                                                                                                                                        |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>         | A timeout occurred during IIOP processing.                                                                                                                                                                                             |
| <i>OpNotAllowed</i>    | Not logged on.                                                                                                                                                                                                                         |
| <i>OpNotSupported</i>  | When called for non-GbE boards.                                                                                                                                                                                                        |
| <i>OpNotSucceeded</i>  | When RefPhys.BoardNr refers to a non-existing board.                                                                                                                                                                                   |
| <i>OperationFailed</i> | In case of <ul style="list-style-type: none"> <li>• Hitless merge is disabled</li> <li>• RefPhys does not exist (or is a backup port)</li> <li>• RefPhys is on the second port pair</li> <li>• RefTs does not match RefPhys</li> </ul> |

**8.46.4.5** void DCM::DeviceControl::InTS\_HitlessMergeSetL ( in unsigned short *BoardNr*, in InTS\_HitlessMergeSettingList\_t *InTS\_HitlessMergeSettingList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed, LicenseError)

Set Hitless merge settings for some input TS.

## Parameters

|    |                                       |                                                     |
|----|---------------------------------------|-----------------------------------------------------|
| in | <i>BoardNr</i>                        | The BoardNr of which parameters need to be changed. |
| in | <i>InTS_Hitless-MergeSetting-List</i> | List of hitless merge settings for input TSs        |

## Exceptions

|                       |                                              |
|-----------------------|----------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing.   |
| <i>OpNotAllowed</i>   | Not logged on.                               |
| <i>OpNotSupported</i> | When called for non-GbE boards.              |
| <i>OpNotSucceeded</i> | When BoardNr refers to a non-existing board. |

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OperationFailed</i> | In case <ul style="list-style-type: none"> <li>• Hitless merge is disabled</li> <li>• RefPhys does not exist (or is a backup port)</li> <li>• RefPhys is on the second port pair</li> <li>• InTS_HitlessMergeSettingList contains nonexistent RefTSIn</li> <li>• InTs_HitlessMergeSettingList contains invalid hitless merge mode</li> <li>• InTs_HitlessMergeSettingList contains invalid UDP socket data when mode is eHitlessMergeMode_EnabledOtherUDP_Socket</li> </ul> |
| <i>LicenseError</i>    | When Hitless merge is enabled and no more FEC licenses available.                                                                                                                                                                                                                                                                                                                                                                                                           |

**Note**

Setting the Mode of a TS to eHitlessMergeMode\_FollowBoardDefault will effectively remove the TS level hitless merge settings for that stream.

**8.46.4.6** void DCM::DeviceControl::SetDefaultRule\_HM\_Mode ( in unsigned short *BoardNr*, in enHitlessMergeDefaultMode\_t *HitlessMergeDefaultMode* ) raises (TimeOut, OperationFailed, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Set the Hitless Merge default mode for hitless merge input TSs of an GbE Board.

**Parameters**

|    |                                |                                                           |
|----|--------------------------------|-----------------------------------------------------------|
| in | <i>BoardNr</i>                 |                                                           |
| in | <i>HitlessMergeDefaultMode</i> | Indicates the board level default mode for hitless merge. |

**Exceptions**

|                        |                                              |
|------------------------|----------------------------------------------|
| <i>TimeOut</i>         | A timeout occurred during IIOP processing.   |
| <i>OpNotAllowed</i>    | Not logged on.                               |
| <i>OpNotSupported</i>  | When called for non-GbE boards.              |
| <i>OpNotSucceeded</i>  | When BoardNr refers to a non-existing board. |
| <i>OperationFailed</i> | When mode is out of range.                   |

**Version**

Release 11.10

**8.46.4.7** void DCM::DeviceControl::SetDefaultRule\_HM\_PacketWindow ( in unsigned short *BoardNr*, in unsigned short *HitlessMergeDefaultPacketWindow* ) raises (TimeOut, OperationFailed, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Set the Hitless Merge default packet window for hitless merge input TSs of an GbE Board.

**Parameters**

|    |                                        |                                                                    |
|----|----------------------------------------|--------------------------------------------------------------------|
| in | <i>BoardNr</i>                         |                                                                    |
| in | <i>HitlessMergeDefaultPacketWindow</i> | Indicates the board level default packet window for hitless merge. |

**Exceptions**

|                        |                                                            |
|------------------------|------------------------------------------------------------|
| <i>TimeOut</i>         | A timeout occurred during IIOP processing.                 |
| <i>OpNotAllowed</i>    | Not logged on.                                             |
| <i>OpNotSupported</i>  | When called for non-GbE boards.                            |
| <i>OpNotSucceeded</i>  | When BoardNr refers to a non-existing board                |
| <i>OperationFailed</i> | When packet window is smaller than 16, or higher than 250. |

**Version**

Release 11.10

**8.46.4.8** void DCM::DeviceControl::SetHitlessMergeModeEnabled ( in unsigned short *BoardNr*, in boolean *HitlessMergeEnable* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Set the Hitless Merge over Separate Port Pairs Enabled setting of an GbE Board.

**Parameters**

|    |                            |                                                          |
|----|----------------------------|----------------------------------------------------------|
| in | <i>BoardNr</i>             |                                                          |
| in | <i>HitlessMerge-Enable</i> | Indicates whether Hitless Merge should be enabled or not |

**Exceptions**

|                        |                                                                                                                                |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>         | A timeout occurred during IIOP processing.                                                                                     |
| <i>OpNotAllowed</i>    | Not logged on.                                                                                                                 |
| <i>OpNotSupported</i>  | When called for non-GbE boards.                                                                                                |
| <i>OpNotSucceeded</i>  | When BoardNr refers to a non-existing board.                                                                                   |
| <i>OperationFailed</i> | When enabling hitless merge while there are input streams which are already routed to an output on the second input port pair. |

**Note**

When hitless merge is being enabled, all FEC configurations will be removed. When hitless merge is being disabled, all hitless merge configuration will be removed.

When enabling hitless merge, the second port pair will become output only, when disabling hitless merge, the second port pair will become input/output again

**Version**

Release 11.10

## 8.47 Statistics

This module contains types, enums and methods related to statistics gathering.

Collaboration diagram for Statistics:

### Classes

- struct [DCM::DeviceControl::GbEFramesRecv\\_t](#)
- struct [DCM::DeviceControl::GbEFramesTrans\\_t](#)
- struct [DCM::DeviceControl::GbEStatisticsEntry\\_t](#)
- struct [DCM::DeviceControl::GbEPortStatsEntry\\_t](#)

### Typedefs

- typedef [GbEStatisticsEntry\\_t](#) [DCM::DeviceControl::GbEStatistics\\_t](#) [4]  
*Statistics for all 4 ports on a GbE board.*
- typedef sequence < [GbEPortStatsEntry\\_t](#) > [DCM::DeviceControl::GbEStatisticsEntryList\\_t](#)  
*A sequence of Statistics, one for each Gbe port on a board.*

### Functions

- void [DCM::DeviceControl::IPS\\_GBE\\_StatisticsReSet](#) (in [IPS\\_Ref\\_t](#) RefPhys) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Reset statistics.*
- void [DCM::DeviceControl::IPS\\_GBE\\_StatisticsGet](#) (in [IPS\\_Ref\\_t](#) RefPhys, out [GbEStatistics\\_t](#) Stats) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get statistics.*
- void [DCM::DeviceControl::IPS\\_GBE\\_RatesGet](#) (in [IPS\\_Ref\\_t](#) RefPhys, out [GbEStatistics\\_t](#) Stats) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get statistics rates per second.*
- void [DCM::DeviceControl::IPS\\_GBE\\_StatisticsGetL](#) (in [IPS\\_Ref\\_t](#) RefPhys, out [GbEStatisticsEntryList\\_t](#) Stats) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get statistics as a list of [GbEStatisticsEntry\\_t](#).*
- void [DCM::DeviceControl::IPS\\_GBE\\_RatesGetL](#) (in [IPS\\_Ref\\_t](#) RefPhys, out [GbEStatisticsEntryList\\_t](#) Stats) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get statistics rates per second.*

### 8.47.1 Detailed Description

This module contains types, enums and methods related to statistics gathering.

### 8.47.2 Typedef Documentation

#### 8.47.2.1 typedef GbEStatisticsEntry\_t DCM::DeviceControl::GbEStatistics\_t[4]

Statistics for all 4 ports on a GbE board.

Definition at line 19909 of file DCM.idl.

#### 8.47.2.2 typedef sequence<GbEPortStatsEntry\_t> DCM::DeviceControl::GbEStatisticsEntryList\_t

A sequence of Statistics, one for each Gbe port on a board.

Definition at line 19916 of file DCM.idl.

### 8.47.3 Function Documentation

#### 8.47.3.1 void DCM::DeviceControl::IPS\_GBE\_RatesGet ( in IPS\_Ref\_t *RefPhys*, out GbEStatistics\_t *Stats* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get statistics rates per second.

Returned values are either since boot or since last call to this function.

#### Parameters

|     |                |                                           |
|-----|----------------|-------------------------------------------|
| in  | <i>RefPhys</i> | specifies the BoardNr. PortNr is ignored. |
| out | <i>Stats</i>   |                                           |

#### Exceptions

|                       |                                                                                                   |
|-----------------------|---------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When called for other boards than GbE ones (Main, ASI,...).                                       |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>Invalid references (<i>RefPhys</i>).</li> </ul> |

**Deprecated** Use IPS\_GBE\_RatesGetL instead.

#### 8.47.3.2 void DCM::DeviceControl::IPS\_GBE\_RatesGetL ( in IPS\_Ref\_t *RefPhys*, out GbEStatisticsEntryList\_t *Stats* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get statistics rates per second.

Returned values are either since boot or since last call to this function.

#### Parameters

|     |                |                                           |
|-----|----------------|-------------------------------------------|
| in  | <i>RefPhys</i> | specifies the BoardNr. PortNr is ignored. |
| out | <i>Stats</i>   |                                           |

**Exceptions**

|                       |                                                                                            |
|-----------------------|--------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When called for other boards than GbE or IP adapter ones (Main, ASI,...).                  |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>Invalid references (RefPhys).</li> </ul> |

**Version**

release 6.9

**8.47.3.3** void DCM::DeviceControl::IPS\_GBE\_StatisticsGet ( in IPS\_Ref\_t *RefPhys*, out GbEStatistics\_t *Stats* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get statistics.

**Parameters**

|     |                |                                           |
|-----|----------------|-------------------------------------------|
| in  | <i>RefPhys</i> | specifies the BoardNr. PortNr is ignored. |
| out | <i>Stats</i>   |                                           |

**Exceptions**

|                       |                                                                                            |
|-----------------------|--------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When called for other boards than GbE ones (Main, ASI,...).                                |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>Invalid references (RefPhys).</li> </ul> |

**Deprecated** Use IPS\_GBE\_StatisticsGetL instead.

**8.47.3.4** void DCM::DeviceControl::IPS\_GBE\_StatisticsGetL ( in IPS\_Ref\_t *RefPhys*, out GbEStatisticsEntryList\_t *Stats* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get statistics as a list of [GbEStatisticsEntry\\_t](#).**Parameters**

|     |                |                                           |
|-----|----------------|-------------------------------------------|
| in  | <i>RefPhys</i> | specifies the BoardNr. PortNr is ignored. |
| out | <i>Stats</i>   |                                           |

**Exceptions**

|                       |                                                                                            |
|-----------------------|--------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When called for other boards than GbE or IP adapter ones (Main, ASI,...).                  |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>Invalid references (RefPhys).</li> </ul> |

**Version**

release 6.9

**8.47.3.5** void DCM::DeviceControl::IPS\_GBE\_StatisticsReSet ( in IPS\_Ref\_t *RefPhys* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Reset statistics.

#### Parameters

|    |                |                                          |
|----|----------------|------------------------------------------|
| in | <i>RefPhys</i> | specifies the BoardNr. PortNr is ignored |
|----|----------------|------------------------------------------|

#### Exceptions

|                       |                                                                                          |
|-----------------------|------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When called for other boards than GbE ones (Main, ASI,...).                              |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"><li>Invalid references (RefPhys).</li></ul> |

## 8.48 IGMPv2

This module contains types, enums and methods related to IGMPv2.

### Classes

- struct [DCM::DeviceControl::IGMPv2MulticastGroup\\_t](#)

### Typedefs

- typedef sequence < [IGMPv2MulticastGroup\\_t](#) > [DCM::DeviceControl::IGMPv2MulticastGroupList\\_t](#)  
*A sequence of [IGMPv2MulticastGroup\\_t](#).*

### Functions

- void [DCM::DeviceControl::IGMPv2JoinMulticastGroupL](#) (in [IPS\\_Ref\\_t](#) RefPhys, in [IGMPv2MulticastGroupList\\_t](#) Groups) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Join zero or more multicast groups.*
- void [DCM::DeviceControl::IGMPv2LeaveMulticastGroupL](#) (in [IPS\\_Ref\\_t](#) RefPhys, in [IGMPv2MulticastGroupList\\_t](#) Groups) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Leave zero or more multicast groups.*
- [IGMPv2MulticastGroupList\\_t](#) [DCM::DeviceControl::IGMPv2GetMulticastGroupL](#) (in [IPS\\_Ref\\_t](#) - RefPhys) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get the list with currently joined multicast groups.*
- void [DCM::DeviceControl::IGMPv2SetMulticastGroupL](#) (in [IPS\\_Ref\\_t](#) RefPhys, in [IGMPv2MulticastGroupList\\_t](#) Groups) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Specify the multicast groups to be joined.*

#### 8.48.1 Detailed Description

This module contains types, enums and methods related to IGMPv2.

**Deprecated** Use the IGMPv3 calls, they also support IGMP protocol v2 (use Exclude filter with no members). These calls are scheduled for removal in v6.00

#### 8.48.2 Typedef Documentation

##### 8.48.2.1 typedef sequence<[IGMPv2MulticastGroup\\_t](#)> [DCM::DeviceControl::IGMPv2MulticastGroupList\\_t](#)

A sequence of [IGMPv2MulticastGroup\\_t](#).

Definition at line 20014 of file DCM.idl.

## 8.48.3 Function Documentation

## 8.48.3.1 IGMPv2MulticastGroupList\_t DCM::DeviceControl::IGMPv2GetMulticastGroupL ( in IPS\_Ref\_t RefPhys ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the list with currently joined multicast groups.

## Parameters

|    |         |                       |
|----|---------|-----------------------|
| in | RefPhys | Board and portnumber. |
|----|---------|-----------------------|

## Returns

Requested list with multicast groups.

## Exceptions

|                |                                                                                               |
|----------------|-----------------------------------------------------------------------------------------------|
| TimeOut        | A timeout occurred during IIOP processing.                                                    |
| OpNotSucceeded | <ul style="list-style-type: none"> <li>IGMP Individual mode is enabled (see below)</li> </ul> |
| OpNotAllowed   | Not logged on.                                                                                |
| OpNotSupported | When called for a non-GbE board.                                                              |

## Note

If RefPhys.PortNr == 0xFFFF, information for all ports is returned.

## 8.48.3.2 void DCM::DeviceControl::IGMPv2JoinMulticastGroupL ( in IPS\_Ref\_t RefPhys, in IGMPv2MulticastGroupList\_t Groups ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Join zero or more multicast groups.

## Parameters

|    |         |                                                         |
|----|---------|---------------------------------------------------------|
| in | RefPhys | Board and port number to perform the join operation on. |
| in | Groups  | List of multicast groups to join.                       |

## Exceptions

|                |                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TimeOut        | A timeout occurred during IIOP processing.                                                                                                                                                                                                                                                                                                                                                                             |
| OpNotSucceeded | In case of <ul style="list-style-type: none"> <li>Invalid references (Groups[i].RefPhys).</li> <li>Invalid multicast IP address (Groups[i].MulticastGroup).</li> <li>Inconsistency between RefPhys.BoardNr and Groups[i].RefPhys.BoardNr.</li> <li>Inconsistency between RefPhys.PortNr and Groups[i].RefPhys.PortNr in case RefPhys.PortNr != 0xFFFF.</li> <li>IGMP Individual mode is enabled (see below)</li> </ul> |
| OpNotAllowed   | Not logged on.                                                                                                                                                                                                                                                                                                                                                                                                         |
| OpNotSupported | When called for a non-GbE board.                                                                                                                                                                                                                                                                                                                                                                                       |

**8.48.3.3** void DCM::DeviceControl::IGMPv2LeaveMulticastGroupL ( in IPS\_Ref\_t *RefPhys*, in IGMPv2MulticastGroupList\_t *Groups* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Leave zero or more multicast groups.

#### Parameters

|    |                |                               |
|----|----------------|-------------------------------|
| in | <i>RefPhys</i> | Specifies BoardNr and PortNr. |
| in | <i>Groups</i>  | List with multicast groups.   |

#### Exceptions

|                       |                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing.                                                                                                                                                                                                                                                                                                                                                                             |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>Invalid references (Groups[i].RefPhys).</li> <li>Invalid multicast IP address (Groups[i].MulticastGroup).</li> <li>Inconsistency between RefPhys.BoardNr and Groups[i].RefPhys.BoardNr.</li> <li>Inconsistency between RefPhys.PortNr and Groups[i].RefPhys.PortNr in case RefPhys.PortNr != 0xFFFF.</li> <li>IGMP Individual mode is enabled (see below)</li> </ul> |
| <i>OpNotAllowed</i>   | Not logged on.                                                                                                                                                                                                                                                                                                                                                                                                         |
| <i>OpNotSupported</i> | When called for a non-GbE board.                                                                                                                                                                                                                                                                                                                                                                                       |

**8.48.3.4** void DCM::DeviceControl::IGMPv2SetMulticastGroupL ( in IPS\_Ref\_t *RefPhys*, in IGMPv2MulticastGroupList\_t *Groups* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Specify the multicast groups to be joined.

No multicast group should exist yet, hence identical to IGMPv2JoinMulticastGroupL. Do not use.

#### Parameters

|    |                |                             |
|----|----------------|-----------------------------|
| in | <i>RefPhys</i> | Board and portnumber.       |
| in | <i>Groups</i>  | List with multicast groups. |

#### Exceptions

|                       |                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing.                                                                                                                                                                                                                                                                                                                                                                             |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>Invalid references (Groups[i].RefPhys).</li> <li>Invalid multicast IP address (Groups[i].MulticastGroup).</li> <li>Inconsistency between RefPhys.BoardNr and Groups[i].RefPhys.BoardNr.</li> <li>Inconsistency between RefPhys.PortNr and Groups[i].RefPhys.PortNr in case RefPhys.PortNr != 0xFFFF.</li> <li>IGMP Individual mode is enabled (see below)</li> </ul> |
| <i>OpNotAllowed</i>   | Not logged on.                                                                                                                                                                                                                                                                                                                                                                                                         |
| <i>OpNotSupported</i> | When called for a non-GbE board.                                                                                                                                                                                                                                                                                                                                                                                       |

## 8.49 IGMPv3

This module contains types, enums and methods related to IGMPv3.

### Classes

- struct [DCM::DeviceControl::IGMPv3Group\\_t](#)

### Typedefs

- typedef sequence< IGMPv3Group\_t > [DCM::DeviceControl::IGMPv3GroupList\\_t](#)

### Enumerations

- enum [DCM::DeviceControl::enumIGMP\\_Version](#) { [DCM::DeviceControl::eIGMPv2](#), [DCM::DeviceControl::eIGMPv3](#) }
- enum [DCM::DeviceControl::enumIGMPv3Filtertype](#) { [DCM::DeviceControl::eIGMPv3IncludeSourceList](#), [DCM::DeviceControl::eIGMPv3ExcludeSourceList](#) }

### Functions

- enumIGMP\_Version [DCM::DeviceControl::GetIGMP\\_Version](#) (in IPS\_Ref\_t RefPhys) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get the highest supported IGMP version.*
- void [DCM::DeviceControl::SetIGMP\\_Version](#) (in IPS\_Ref\_t RefPhys, in enumIGMP\_Version en-Version) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Set the highest IGMP version to be supported.*
- IGMPv3GroupList\_t [DCM::DeviceControl::IGMPv3GetMulticastGroupL](#) (in IPS\_Ref\_t RefPhys, in IGMPv3GroupList\_t Groups) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get the list of multicast groups and filter specifications.*
- void [DCM::DeviceControl::IGMPv3JoinLeaveL](#) (in IPS\_Ref\_t RefPhys, in IGMPv3GroupList\_t - Groups) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Join and/or leave multiple multicast groups.*
- void [DCM::DeviceControl::SetIGMP\\_IndividualMode](#) (in unsigned short BoardNumber, in boolean bModeOn) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*(Un)set individual join mode for this board.*
- void [DCM::DeviceControl::GetIGMP\\_IndividualMode](#) (in unsigned short BoardNumber, out boolean bModeOn) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get the individual join mode for this board.*

#### 8.49.1 Detailed Description

This module contains types, enums and methods related to IGMPv3.

#### 8.49.2 Typedef Documentation

##### 8.49.2.1 typedef sequence<IGMPv3Group\_t> DCM::DeviceControl::IGMPv3GroupList\_t

Definition at line 20133 of file DCM.idl.

### 8.49.3 Enumeration Type Documentation

#### 8.49.3.1 enum DCM::DeviceControl::enumIGMP\_Version

Enumerator:

*eIGMPv2*

*eIGMPv3*

Definition at line 20113 of file DCM.idl.

#### 8.49.3.2 enum DCM::DeviceControl::enumIGMPv3Filtertype

Enumerator:

*eIGMPv3IncludeSourceList*

*eIGMPv3ExcludeSourceList*

Definition at line 20118 of file DCM.idl.

### 8.49.4 Function Documentation

#### 8.49.4.1 void DCM::DeviceControl::GetIGMP\_IndividualMode ( in unsigned short *BoardNumber*, out boolean *bModeOn* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the individual join mode for this board.

##### Parameters

|     |                    |                                                                         |
|-----|--------------------|-------------------------------------------------------------------------|
| in  | <i>BoardNumber</i> | The board to apply the call on. Only DCG boards currently support this. |
| out | <i>bModeOn</i>     | Enable the individuel mode                                              |

##### Exceptions

|                       |                                                                   |
|-----------------------|-------------------------------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing.                        |
| <i>OpNotSucceeded</i> | When boardnumber doesn't specify a DCG card.                      |
| <i>OpNotAllowed</i>   | Not logged on.                                                    |
| <i>OpNotSupported</i> | When this call is not supported in the runningi software version. |

##### Version

8.5

#### 8.49.4.2 enumIGMP\_Version DCM::DeviceControl::GetIGMP\_Version ( in IPS\_Ref\_t *RefPhys* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the highest supported IGMP version.

##### Exceptions

|                       |                                            |
|-----------------------|--------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing. |
| <i>OpNotSucceeded</i> | Never thrown.                              |
| <i>OpNotAllowed</i>   | Not logged on.                             |

|                       |                                                                                                      |
|-----------------------|------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | When called for a non-GbE board, or when this call is not supported in the running software version. |
|-----------------------|------------------------------------------------------------------------------------------------------|

#### 8.49.4.3 IGMPv3GroupList\_t DCM::DeviceControl::IGMPv3GetMulticastGroupL ( in IPS\_Ref\_t RefPhys, in IGMPv3GroupList\_t Groups ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the list of multicast groups and filter specifications.

This includes both the groups joined statically from the GUI and multicast groups joined dynamically by the DCM software.

Depending on the individual join mode, the RefPhys's are interpreted as PortSet or individual ports

##### Parameters

|    |                |                                                                                                                                                                                                              |
|----|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>RefPhys</i> | Port(Set) to retrieve information from. Wildcard and virtual port(set)s allowed.                                                                                                                             |
| in | <i>Groups</i>  | Groups to retrieve information about. Pass an empty sequence in order to retrieve all groups. Only m_iPortNr and m_MulticastAddres are interpreted, other <a href="#">IGMPv3Group_t</a> members are ignored. |

##### Returns

Requested list with multicast settings.

##### Exceptions

|                       |                                                                                                      |
|-----------------------|------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing.                                                           |
| <i>OpNotSucceeded</i> | RefPhys is not a portset                                                                             |
| <i>OpNotAllowed</i>   | Not logged on.                                                                                       |
| <i>OpNotSupported</i> | When called for a non-GbE board, or when this call is not supported in the running software version. |

#### 8.49.4.4 void DCM::DeviceControl::IGMPv3JoinLeaveL ( in IPS\_Ref\_t RefPhys, in IGMPv3GroupList\_t Groups ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Join and/or leave multiple multicast groups.

For an IGMPv2 join, specify filter mode E (exclusive) and an empty filter list. For leaving, specify filter mode I (inclusive) and an empty filter list. This call also allows to change the filter mode or filter list for a previously joined group.

Depending on the individual join mode, the RefPhys's are interpreted as PortSet or individual ports

##### Parameters

|    |                |                                                |
|----|----------------|------------------------------------------------|
| in | <i>RefPhys</i> | Number of the board to change settings on.     |
| in | <i>Groups</i>  | Group list. Member m_bLeaveAllowed is ignored. |

**Exceptions**

|                       |                                                                                                                                                                                                 |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing.                                                                                                                                                      |
| <i>OpNotSucceeded</i> | The Portset we should join on does not exist, or if the number of joined multicast groups exceeds a predefined limit, or if it was attempted to leave a group that was not joined from the GUI. |
| <i>OpNotAllowed</i>   | Not logged on.                                                                                                                                                                                  |
| <i>OpNotSupported</i> | When called for a non-GbE board, or when this call is not supported in the running software version.                                                                                            |

**8.49.4.5** void DCM::DeviceControl::SetIGMP\_IndividualMode ( in unsigned short *BoardNumber*, in boolean *bModeOn* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

(Un)set individual join mode for this board.

When enabled, it is possible to join a multicast address on a single interface and not on the port pair.

When switching from individual mode to paired mode, all multicast groups will be removed. When going from paired mode to individual mode, all groups are kept.

**Parameters**

|    |                    |                                                                         |
|----|--------------------|-------------------------------------------------------------------------|
| in | <i>BoardNumber</i> | The board to apply the call on. Only DCG boards currently support this. |
| in | <i>bModeOn</i>     | Enable the individual mode                                              |

**Exceptions**

|                       |                                                                  |
|-----------------------|------------------------------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing.                       |
| <i>OpNotSucceeded</i> | When boardnumber doesn't specify a DCG card.                     |
| <i>OpNotAllowed</i>   | Not logged on.                                                   |
| <i>OpNotSupported</i> | When this call is not supported in the running software version. |

**Version**

8.5

**8.49.4.6** void DCM::DeviceControl::SetIGMP\_Version ( in IPS\_Ref\_t *RefPhys*, in enumIGMP\_Version *enVersion* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the highest IGMP version to be supported.

**Parameters**

|    |                  |                                     |
|----|------------------|-------------------------------------|
| in | <i>RefPhys</i>   | Board to which the setting applies. |
| in | <i>enVersion</i> | Either eIGMPv2 or eIGMPv3.          |

**Exceptions**

|                       |                                                                                                      |
|-----------------------|------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing.                                                           |
| <i>OpNotSucceeded</i> | When called with a non supported enVersion.                                                          |
| <i>OpNotAllowed</i>   | Not logged on.                                                                                       |
| <i>OpNotSupported</i> | When called for a non-GbE board, or when this call is not supported in the running software version. |

## 8.50 (Packet Counting and Threshold Monitoring)

Advanced Statistics for the GbE board: counters and threshold monitoring both for packets types before and after the error correction block for several configurations such as FEC protection, Individual Ports Hitless Merge, Hitless Merge over Separate Ports and also for when no error correction is enabled.

### Classes

- struct [DCM::DeviceControl::PCTM\\_ThresholdValues\\_t](#)  
*Threshold settings.*

*Get packet counters of one, multiple or all streams.*

- void **DCM::DeviceControl::PCTM\_Reset** (in unsigned short *BoardNr*) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

*Reset all packet counters, clear all threshold alarms and restart all threshold measurement windows.*

### 8.50.1 Detailed Description

Advanced Statistics for the GbE board: counters and threshold monitoring both for packets types before and after the error correction block for several configurations such as FEC protection, Individual Ports Hitless Merge, Hitless Merge over Separate Ports and also for when no error correction is enabled.

### 8.50.2 Typedef Documentation

#### 8.50.2.1 typedef sequence<PCTM\_StreamPacketCounters\_t> DCM::DeviceControl::PCTM\_StreamPacketCounters\_List\_t

Packet counters of multiple streams.

Definition at line 20325 of file DCM.idl.

#### 8.50.2.2 typedef sequence<PCTM\_StreamThresholdSettings\_t> DCM::DeviceControl::PCTM\_StreamThresholdSettings\_List\_t

Threshold settings for the packet types of multiple streams.

Definition at line 20295 of file DCM.idl.

### 8.50.3 Function Documentation

#### 8.50.3.1 void DCM::DeviceControl::PCTM\_GetBoardDefThresholds ( in unsigned short *BoardNr*, out PCTM\_ThresholdValues\_t *BoardDefaultSettings* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Get board default threshold settings for each packet type.

#### Parameters

|    |                             |                                                       |
|----|-----------------------------|-------------------------------------------------------|
| in | <i>BoardNr</i>              | The slot/board to retrieve the default settings from. |
| in | <i>BoardDefaultSettings</i> | The board default threshold settings to retrieve.     |

#### Exceptions

|                       |                                                                |
|-----------------------|----------------------------------------------------------------|
| <i>Timeout</i>        | Is thrown when it takes too long to handle the call;           |
| <i>OpNotSucceeded</i> | Is thrown when supplying an invalid or non-existing board nbr; |
| <i>OpNotSupported</i> | Is thrown when called for another board than a GbE IO-board;   |

**Version**

Release 11.10

**8.50.3.2** void DCM::DeviceControl::PCTM\_GetPacketCounters ( in IPS\_Ref\_t *Location*, in IPS\_RefTS\_List\_t *Streams*, out PCTM\_StreamPacketCounters\_List\_t *PacketCounters* )  
 raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Get packet counters of one, multiple or all streams.

**Note**

Packet counters can be retrieved for all packet types both in case:

- no error correction is configured;
- FEC protection is enabled;
- Single Port Hitless Merge is enabled;
- Hitless Merge over Separate Ports is enabled;

In general, the Missing Packets before Error Correction counters are only increased for those streams for which stream specific settings have a non-zero threshold value. (limited to maximally 32 main TS per port pair)

If no error correction is configured, only the Valid Packet counters and the Missing Packets after Error Correction counters are increased.

The Fixed Packet counters are only increased if FEC protection is used.

**Remarks**

Both parameter 'Location' and 'Streams' are used to filter. If 'Streams' is an empty list, then use 'Location' to filter all streams on the specified location (board level, port level, etc.). If 'Streams' is not an empty list then return packet counters for the streams explicitly specified, but in that case the location is not allowed to conflict with any of the streams.

**Parameters**

|    |                       |                                                         |
|----|-----------------------|---------------------------------------------------------|
| in | <i>Location</i>       | The slot/board to fetch the counters from.              |
| in | <i>Streams</i>        | The streams for which to retrieve the packet counters.  |
| in | <i>PacketCounters</i> | The retrieved packet counters of the specified streams. |

**Exceptions**

|                       |                                                                |
|-----------------------|----------------------------------------------------------------|
| <i>Timeout</i>        | Is thrown when it takes too long to handle the call;           |
| <i>OpNotSucceeded</i> | Is thrown when supplying an invalid or non-existing board nbr; |
| <i>OpNotSupported</i> | Is thrown when called for another board than a GbE IO-board;   |

## Version

Release 11.10

**8.50.3.3** void DCM::DeviceControl::PCTM\_GetStreamThresholds ( in IPS\_Ref\_t *Location*, in IPS\_RefTS\_List\_t *Streams*, out PCTM\_StreamThresholdSettings\_List\_t *StreamSpecificSettings* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Get stream specific packet type thresholds settings.

## Remarks

Both parameter 'Location' and 'Streams' are used to filter. If 'Streams' is an empty list, then use 'Location' to filter all streams on the specified location (board level, port level, etc.). If 'Streams' is not an empty list then return settings for the streams explicitly specified, but in that case the location is not allowed to conflict with any of the streams.

## Parameters

|    |                               |                                                             |
|----|-------------------------------|-------------------------------------------------------------|
| in | <i>Location</i>               | The location to retrieve the stream specific settings from. |
| in | <i>Streams</i>                | The streams for which to retrieve the threshold settings.   |
| in | <i>StreamSpecificSettings</i> | The stream specific threshold settings.                     |

## Exceptions

|                       |                                                                |
|-----------------------|----------------------------------------------------------------|
| <i>Timeout</i>        | Is thrown when it takes too long to handle the call;           |
| <i>OpNotSucceeded</i> | Is thrown when supplying an invalid or non-existing board nbr; |
| <i>OpNotSupported</i> | Is thrown when called for another board than a GbE IO-board;   |

## Version

Release 11.10

**8.50.3.4** void DCM::DeviceControl::PCTM\_Reset ( in unsigned short *BoardNr* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Reset all packet counters, clear all threshold alarms and restart all threshold measurement windows.

## Note

reset will also reset the existing 'FEC Dec statistics'

## Parameters

|    |                |                          |
|----|----------------|--------------------------|
| in | <i>BoardNr</i> | The slot/board to reset. |
|----|----------------|--------------------------|

## Exceptions

|                       |                                                                |
|-----------------------|----------------------------------------------------------------|
| <i>Timeout</i>        | Is thrown when it takes too long to handle the call;           |
| <i>OpNotSucceeded</i> | Is thrown when supplying an invalid or non-existing board nbr; |

|                       |                                                              |
|-----------------------|--------------------------------------------------------------|
| <i>OpNotSupported</i> | Is thrown when called for another board than a GbE IO-board; |
|-----------------------|--------------------------------------------------------------|

**Version**

Release 11.10

**8.50.3.5** void DCM::DeviceControl::PCTM\_SetBoardDefThresholds ( in unsigned short *BoardNr*, in PCTM\_ThresholdValues\_t *BoardDefaultSettings* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Set board default threshold settings for each packet type.

**Note**

The threshold settings comprise threshold values where a non-zero threshold value indicates the threshold monitoring is active for all counters of the respective packet type unless stream specific threshold settings decide otherwise.

If the threshold value for a stream's packet type is reached an alarm will be raised for the packet type of that specific stream. An evaluation is made at the end of each 30 sec measurement window ignoring measurements of previous windows. The alarm will automatically be cleared due to one of the next measurement window evaluations as soon as the threshold value was not exceeded during the new window.

Threshold values of zero imply no threshold monitoring is active so no alarms can be raised for that packet type. (unless for streams with stream specific settings that decide otherwise) Changing a non-zero threshold value back to zero will only clear the alarms for the respective packet type during the next measurement window evaluation. (unless for streams with stream specific settings that decide otherwise)

Enabling threshold monitoring for the Missing Packet before Error Correction packet type is only possible using stream specific threshold settings.

**Parameters**

|    |                             |                                                  |
|----|-----------------------------|--------------------------------------------------|
| in | <i>BoardNr</i>              | The slot/board to apply the default settings on. |
| in | <i>BoardDefaultSettings</i> | The board default threshold settings to apply.   |

**Exceptions**

|                        |                                                                                                                                                                      |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Timeout</i>         | Is thrown when it takes too long to handle the call;                                                                                                                 |
| <i>OpNotSucceeded</i>  | Is thrown when supplying an invalid or non-existing board nbr;                                                                                                       |
| <i>OpNotSupported</i>  | Is thrown when called for another board than a GbE IO-board;                                                                                                         |
| <i>OperationFailed</i> | Is thrown when: <ul style="list-style-type: none"> <li>supplying a non-zero threshold value for the Missing Packet before Error - Correction packet type.</li> </ul> |

**Version**

Release 11.10

**8.50.3.6** void DCM::DeviceControl::PCTM\_SetStreamThresholds ( in unsigned short *BoardNr*,  
in PCTM\_StreamThresholdSettings\_List\_t *StreamSpecificSettings* ) raises (TimeOut,  
OpNotSucceeded, OpNotAllowed, OpNotSupported, OperationFailed)

Set or unset stream specific packet type thresholds settings that overwrite the board default settings.

#### Note

The same general behaviour concerning threshold monitoring such as measurement windows, evaluations, alarm raising and clearing, and configuration as described for the board level default settings apply;

For each stream the board default threshold settings are used for each of its packet types unless stream specific threshold settings are supplied by providing a non-zero threshold value for each packet type for which the board default is not to be used.

Disabling the stream specific threshold settings is done by providing a threshold value of zero for each of the stream's packet types where the board default is to be used again for.

Providing stream specific non-zero threshold values for the Missing Packet before Error Correction packet type will in addition enable the packet counter for the packet type of the stream, limited to 32 main TS per port pair.

Changing a non-zero stream specific threshold value back to zero while the board default threshold value for the same packet type is zero will as a side-effect trigger, if applicable, clearing the alarm of that stream for that packet type.

#### Parameters

|    |                                |                                                          |
|----|--------------------------------|----------------------------------------------------------|
| in | <i>BoardNr</i>                 | The slot/board to apply the stream specific settings on. |
| in | <i>StreamSpecific-Settings</i> | The stream specific threshold settings.                  |

#### Exceptions

|                        |                                                                                                                                                                                                                                                                                                       |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Timeout</i>         | Is thrown when it takes too long to handle the call;                                                                                                                                                                                                                                                  |
| <i>OpNotSucceeded</i>  | Is thrown when supplying an invalid or non-existing board nbr;                                                                                                                                                                                                                                        |
| <i>OpNotSupported</i>  | Is thrown when called for another board than a GbE IO-board;                                                                                                                                                                                                                                          |
| <i>OperationFailed</i> | Is thrown when: <ul style="list-style-type: none"> <li>supplying an empty list of settings;</li> <li>supplying settings such that the total number of streams per board for which the Missing Packet before Error Correction threshold value is non-zero exceeds 32 main TS per port pair;</li> </ul> |

#### Version

Release 11.10

## 8.51 License

This module contains types, enums and methods related to license.

### Classes

- struct `DCM::DeviceControl::Feature_t`
- struct `DCM::DeviceControl::LicenseValidation_t`
- struct `DCM::DeviceControl::TempLicenseData`
- struct `DCM::DeviceControl::FeatureUsage_t`  
*Represents the license usage count per feature.*
- struct `DCM::DeviceControl::BoardFeatureUsage_t`  
*Contains the feature usage per board.*

### Typedefs

- typedef `sequence< Feature_t > DCM::DeviceControl::FeatureList_t`  
*Sequence of Features ...*
- typedef `unsigned short DCM::DeviceControl::TempLicenseState_t`
- typedef `sequence< FeatureUsage_t > DCM::DeviceControl::FeatureUsageList_t`  
*A list of [FeatureUsage\\_t](#) elements.*
- typedef `sequence< BoardFeatureUsage_t > DCM::DeviceControl::BoardFeatureUsageList_t`  
*A list of [BoardFeatureUsage\\_t](#) elements.*

### Enumerations

- enum `DCM::DeviceControl::eFeatureState` { `DCM::DeviceControl::eFeatureInvalid`, `DCM::DeviceControl::eFeatureDisabled`, `DCM::DeviceControl::eFeatureEnabled` }  
*Feature Status.*
- enum `DCM::DeviceControl::eFeatureType` { `DCM::DeviceControl::eFeatureUnknown`, `DCM::DeviceControl::eFeatureInherited`, `DCM::DeviceControl::eFeatureNative` }  
*Feature Type.*
- enum `DCM::DeviceControl::eFeatureInstallState` { `DCM::DeviceControl::eFeatureEmpty`, `DCM::DeviceControl::eFeatureNotInstalled`, `DCM::DeviceControl::eFeatureInstalled` }  
*Install State.*
- enum `DCM::DeviceControl::eFeatureExpireState` { `DCM::DeviceControl::eFeatureExpired`, `DCM::DeviceControl::eFeatureNotExpired` }  
*obsolete: not used for temporary licenses a temporary license gives access to all feature during a limited time.*
- enum `DCM::DeviceControl::eDeviceState` { `DCM::DeviceControl::eDeviceStateInvalid`, `DCM::DeviceControl::eDeviceStateMain`, `DCM::DeviceControl::eDeviceStateBackup`, `DCM::DeviceControl::eDeviceStateReserved1`, `DCM::DeviceControl::eDeviceStateReserved2`, `DCM::DeviceControl::eDeviceStateReserved3`, `DCM::DeviceControl::eDeviceStateReserved4` }

## Functions

- void [DCM::DeviceControl::UninstallFeature](#) (in unsigned short BoardNr, in string Name) raises (-TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*UnInstalls the license of a feature.*
- void [DCM::DeviceControl::SetFeatureState](#) (in unsigned short BoardNr, in string Name, in eFeature-State State) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Sets the state of a feature.*
- void [DCM::DeviceControl::GetHostId](#) (in unsigned short BoardNr, out string HostId) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*GetHostId.*
- void [DCM::DeviceControl::GetFamilyName](#) (in unsigned short BoardNr, out string FamilyName) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*GetFamilyName.*
- FeatureList\_t [DCM::DeviceControl::GetFeatureSettings](#) (in unsigned short BoardNr) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Gets the settings of all the registered features.*
- LicenseValidation\_t [DCM::DeviceControl::GetLicenseValidation](#) (in unsigned short BoardNr) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*GetVersionAndValidationKey.*
- eDeviceState [DCM::DeviceControl::GetDeviceState](#) (in unsigned short BoardNr) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*GetDeviceState.*
- TempLicenseData [DCM::DeviceControl::GetTempLicenseData](#) (in unsigned short BoardNr) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Gets the data of the Temporary Licenses.*
- void [DCM::DeviceControl::ExpireTempLicenses](#) (in unsigned short BoardNr) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Makes sure the temporary licenses are expired at the time the users wants it.*
- BoardFeatureUsageList\_t [DCM::DeviceControl::GetBoardFeatureUsageL](#) (in unsigned short BoardNr) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Returns the licenses in use per feature and per board.*

## Variables

- const TempLicenseState\_t [DCM::DeviceControl::TEMP\\_LICENSE\\_NOT\\_ACTIVE](#) = 0  
*no temporary licenses active*
- const TempLicenseState\_t [DCM::DeviceControl::TEMP\\_LICENSE\\_ACTIVE](#) = 1  
*temporary licenses active*
- const TempLicenseState\_t [DCM::DeviceControl::TEMP\\_LICENSE\\_WAITING](#) = 2  
*temporary licenses waiting for the start time to become active*

### 8.51.1 Detailed Description

This module contains types, enums and methods related to license.

## 8.51.2 Typedef Documentation

### 8.51.2.1 typedef sequence<BoardFeatureUsage\_t> DCM::DeviceControl::BoardFeatureUsageList\_t

A list of [BoardFeatureUsage\\_t](#) elements.

Definition at line 20714 of file DCM.idl.

### 8.51.2.2 typedef sequence<Feature\_t> DCM::DeviceControl::FeatureList\_t

Sequence of Features ...

Definition at line 20548 of file DCM.idl.

### 8.51.2.3 typedef sequence<FeatureUsage\_t> DCM::DeviceControl::FeatureUsageList\_t

A list of [FeatureUsage\\_t](#) elements.

Definition at line 20702 of file DCM.idl.

### 8.51.2.4 typedef unsigned short DCM::DeviceControl::TempLicenseState\_t

Definition at line 20655 of file DCM.idl.

## 8.51.3 Enumeration Type Documentation

### 8.51.3.1 enum DCM::DeviceControl::eDeviceState

Enumerator:

*eDeviceStateInvalid* Device is in an invalid state, meaning no licenses can be taken.

*eDeviceStateMain* Device is MAIN.

*eDeviceStateBackup* Device is BACKUP.

*eDeviceStateReserved1* reserved for future use

*eDeviceStateReserved2* reserved for future use

*eDeviceStateReserved3* reserved for future use

*eDeviceStateReserved4* reserved for future use

Definition at line 20632 of file DCM.idl.

### 8.51.3.2 enum DCM::DeviceControl::eFeatureExpireState

obsolete: not used for temporary licenses a temporary license gives access to all feature during a limited time.

Enumerator:

*eFeatureExpired*

*eFeatureNotExpired*

Definition at line 20525 of file DCM.idl.

### 8.51.3.3 enum DCM::DeviceControl::eFeatureInstallState

Install State.

**Enumerator:**

*eFeatureEmpty* invalid or unused table entry  
*eFeatureNotInstalled* no valid license key has ever been entered  
*eFeatureInstalled*

Definition at line 20516 of file DCM.idl.

**8.51.3.4 enum DCM::DeviceControl::eFeatureState**

Feature Status.

**Enumerator:**

*eFeatureInvalid* --> Value may not be used !!!  
*eFeatureDisabled*  
*eFeatureEnabled*

Definition at line 20500 of file DCM.idl.

**8.51.3.5 enum DCM::DeviceControl::eFeatureType**

Feature Type.

**Enumerator:**

*eFeatureUnknown*  
*eFeatureInherited*  
*eFeatureNative*

Definition at line 20508 of file DCM.idl.

**8.51.4 Function Documentation****8.51.4.1 void DCM::DeviceControl::ExpireTempLicenses ( in unsigned short *BoardNr* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)**

Makes sure the temporary licenses are expired at the time the users wants it.

Remark: when this is not used, the temporary licenses will expire on the given expiration time and the system will reboot in case there are more licenses used than there are licenses available per feature.

**Parameters**

|    |                |  |
|----|----------------|--|
| in | <i>BoardNr</i> |  |
|----|----------------|--|

**Exceptions**

|                       |                                                                                  |
|-----------------------|----------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | <ul style="list-style-type: none"> <li>• Boadnr != 0 (mainboard only)</li> </ul> |
|-----------------------|----------------------------------------------------------------------------------|

**8.51.4.2 BoardFeatureUsageList\_t DCM::DeviceControl::GetBoardFeatureUsageL ( in unsigned short *BoardNr* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)**

Returns the licenses in use per feature and per board.

T

**Parameters**

|    |                |                            |
|----|----------------|----------------------------|
| in | <i>BoardNr</i> | board number. Should be 0. |
|----|----------------|----------------------------|

**Returns**

BoardFeatureUsageList\_t

**Exceptions**

|                       |                                                                                |
|-----------------------|--------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | <ul style="list-style-type: none"><li>• Boadnr != 0 (mainboard only)</li></ul> |
|-----------------------|--------------------------------------------------------------------------------|

**Version**

Release 8.5

**8.51.4.3 eDeviceState DCM::DeviceControl::GetDeviceState ( in unsigned short *BoardNr* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)**

GetDeviceState.

**Parameters**

|    |                |  |
|----|----------------|--|
| in | <i>BoardNr</i> |  |
|----|----------------|--|

**Returns**

eDeviceState

**Exceptions**

|                       |                                                                                |
|-----------------------|--------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | <ul style="list-style-type: none"><li>• Boadnr != 0 (mainboard only)</li></ul> |
|-----------------------|--------------------------------------------------------------------------------|

**8.51.4.4 void DCM::DeviceControl::GetFamilyName ( in unsigned short *BoardNr*, out string *FamilyName* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)**

GetFamilyName.

**Parameters**

|     |                   |  |
|-----|-------------------|--|
| in  | <i>BoardNr</i>    |  |
| out | <i>FamilyName</i> |  |

**Exceptions**

|                       |                                                                                   |
|-----------------------|-----------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | <ul style="list-style-type: none"> <li>• Boardnr != 0 (mainboard only)</li> </ul> |
|-----------------------|-----------------------------------------------------------------------------------|

**8.51.4.5 FeatureList\_t DCM::DeviceControl::GetFeatureSettings ( in unsigned short *BoardNr* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)**

Gets the settings of all the registered features.

**Parameters**

|    |                |  |
|----|----------------|--|
| in | <i>BoardNr</i> |  |
|----|----------------|--|

**Returns**

FeatureList

**Exceptions**

|                       |                                                                                   |
|-----------------------|-----------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | <ul style="list-style-type: none"> <li>• Boardnr != 0 (mainboard only)</li> </ul> |
|-----------------------|-----------------------------------------------------------------------------------|

**8.51.4.6 void DCM::DeviceControl::GetHostId ( in unsigned short *BoardNr*, out string *HostId* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)**

GetHostId.

**Parameters**

|     |                |  |
|-----|----------------|--|
| in  | <i>BoardNr</i> |  |
| out | <i>HostId</i>  |  |

**Exceptions**

|                       |                                                                                   |
|-----------------------|-----------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | <ul style="list-style-type: none"> <li>• Boardnr != 0 (mainboard only)</li> </ul> |
|-----------------------|-----------------------------------------------------------------------------------|

**8.51.4.7 LicenseValidation\_t DCM::DeviceControl::GetLicenseValidation ( in unsigned short *BoardNr* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)**

GetVersionAndValidationKey.

**Parameters**

|    |                |  |
|----|----------------|--|
| in | <i>BoardNr</i> |  |
|----|----------------|--|

**Returns**[LicenseValidation\\_t](#)**Exceptions**

|                       |                                                                                  |
|-----------------------|----------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | <ul style="list-style-type: none"> <li>• Boadnr != 0 (mainboard only)</li> </ul> |
|-----------------------|----------------------------------------------------------------------------------|

**8.51.4.8** TempLicenseData DCM::DeviceControl::GetTempLicenseData ( in unsigned short *BoardNr* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the data of the Temporary Licenses.

**Parameters**

|    |                |  |
|----|----------------|--|
| in | <i>BoardNr</i> |  |
|----|----------------|--|

**Returns**[TempLicenseData](#)**Exceptions**

|                       |                                                                                  |
|-----------------------|----------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | <ul style="list-style-type: none"> <li>• Boadnr != 0 (mainboard only)</li> </ul> |
|-----------------------|----------------------------------------------------------------------------------|

**8.51.4.9** void DCM::DeviceControl::SetFeatureState ( in unsigned short *BoardNr*, in string *Name*, in eFeatureState *State* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Sets the state of a feature.

**Parameters**

|    |                |                    |
|----|----------------|--------------------|
| in | <i>BoardNr</i> |                    |
| in | <i>Name</i>    | FeatureName.       |
| in | <i>State</i>   | Disable or Enable. |

**Exceptions**

|                       |                                                                                                                                                                                                                      |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | <ul style="list-style-type: none"> <li>• BoardNr != 0 (mainboard only)</li> <li>• State is not valid</li> <li>• Feature can't be enabled when feature isn't installed</li> <li>• Feature is not supported</li> </ul> |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**8.51.4.10** void DCM::DeviceControl::UninstallFeature ( in unsigned short *BoardNr*, in string *Name* )  
 raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

UnInstalls the license of a feature.

#### Parameters

|    |                |                           |
|----|----------------|---------------------------|
| in | <i>BoardNr</i> |                           |
| in | <i>Name</i>    | FeatureName to uninstall. |

#### Exceptions

|                       |                                                                                                                       |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | <ul style="list-style-type: none"> <li>• BoardNr != 0 (mainboard only)</li> <li>• Feature is not supported</li> </ul> |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------|

#### Note

The IDL-call to install the Features is described in the DCM\_MB.idl document.

### 8.51.5 Variable Documentation

**8.51.5.1** const TempLicenseState\_t DCM::DeviceControl::TEMP\_LICENSE\_ACTIVE = 1

temporary licenses active

Definition at line 20657 of file DCM.idl.

**8.51.5.2** const TempLicenseState\_t DCM::DeviceControl::TEMP\_LICENSE\_NOT\_ACTIVE = 0

no temporary licenses active

Definition at line 20656 of file DCM.idl.

**8.51.5.3** const TempLicenseState\_t DCM::DeviceControl::TEMP\_LICENSE\_WAITING = 2

temporary licenses waiting for the start time to become active

Definition at line 20658 of file DCM.idl.

## 8.52 Backup

In this group different backup type definitions, enums and methods are defined.

Collaboration diagram for Backup:

### Classes

- struct [DCM::DeviceControl::ServiceBackupParams\\_t](#)
- struct [DCM::DeviceControl::BackupService\\_t](#)
- struct [DCM::DeviceControl::BackupSrvTable\\_t](#)
- struct [DCM::DeviceControl::ServiceBackupParams2\\_t](#)
- struct [DCM::DeviceControl::AltSrcBU\\_Setting\\_t](#)
- struct [DCM::DeviceControl::AltSrcMergeActiveInSvc\\_t](#)
- struct [DCM::DeviceControl::TsOutSvcSourceSelection\\_t](#)

### Modules

- [TS and Service Backup](#)
- [1:1 Device Backup](#)
- [Define and activate TS Backup](#)
- *end of one\_to\_one\_backup*
- [MIP Synchronization feature](#)

### Typedefs

- typedef sequence< BackupService\_t > [DCM::DeviceControl::BackupServiceList\\_t](#)
- typedef sequence< BackupSrvTable\_t > [DCM::DeviceControl::BackupSrvTableList\\_t](#)
- typedef sequence< AltSrcBU\_Setting\_t > [DCM::DeviceControl::AltSrcBU\\_SettingList\\_t](#)
- typedef sequence< AltSrcMergeActiveInSvc\_t > [DCM::DeviceControl::AltSrcMergeActiveInSvcList\\_t](#)

- typedef sequence < TsOutSvcSourceSelection\_t > [DCM::DeviceControl::TsOutSvcSourceSelection-List\\_t](#)

### Enumerations

- enum [DCM::DeviceControl::eServiceBackupMode\\_t](#) { [DCM::DeviceControl::eSBU\\_NonRevertive](#), [DCM::DeviceControl::eSBU\\_Revertive](#), [DCM::DeviceControl::eSBU\\_Floating](#) }
- enum [DCM::DeviceControl::ServiceSourcePriority\\_t](#) { [DCM::DeviceControl::eMainPriority](#), [DCM::DeviceControl::eHighestBackupPriority](#), [DCM::DeviceControl::eReservedPriority1](#), [DCM::DeviceControl::eReservedPriority2](#), [DCM::DeviceControl::eReservedPriority3](#), [DCM::DeviceControl::eReservedPriority4](#), [DCM::DeviceControl::eReservedPriority5](#), [DCM::DeviceControl::eReservedPriority6](#), [DCM::DeviceControl::eReservedPriority7](#) }

### Functions

- void [DCM::DeviceControl::SetServiceBU\\_Params](#) (in [IPS\\_Service\\_t](#) OutService, in [ServiceBackupParams\\_t](#) ServiceBackupParams) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Sets the ServiceBackup parameters for an output service.*

- void [DCM::DeviceControl::GetServiceBU\\_Params](#) (in [IPS\\_Service\\_t](#) OutService, out [ServiceBackupParams\\_t](#) ServiceBackupParams) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Gets the ServiceBackup parameters of an output service.*

- void [DCM::DeviceControl::SetServiceBU\\_Params2](#) (in [IPS\\_Service\\_t](#) OutService, in [ServiceBackupParams2\\_t](#) ServiceBackupParams2) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Sets the ServiceBackup parameters for an output service.*

- void [DCM::DeviceControl::GetServiceBU\\_Params2](#) (in [IPS\\_Service\\_t](#) OutService, out [ServiceBackupParams2\\_t](#) ServiceBackupParams2) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Gets the ServiceBackup parameters of an output service.*

- void [DCM::DeviceControl::SetServiceBU\\_BackupL](#) (in [IPS\\_Service\\_t](#) OutService, in [BackupSrvTableList\\_t](#) BackupSrvList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Sets the ServiceBackupList of an output service.*

- void [DCM::DeviceControl::GetServiceBU\\_BackupL](#) (in [IPS\\_Service\\_t](#) OutService, out [BackupSrvTableList\\_t](#) BackupSrvList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Gets the ServiceBackupList of an output service.*

- void [DCM::DeviceControl::SetActiveInputService](#) (in [IPS\\_Service\\_t](#) OutService, in [IPS\\_Service\\_t](#) InMergeSvcSource, in [IPS\\_Service\\_t](#) ActiveInService) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Lets the user activate for a certain output service, the input service to be used.*

- void [DCM::DeviceControl::GetActiveInputService](#) (in [IPS\\_Service\\_t](#) OutService, in [IPS\\_Service\\_t](#) InMergeSvcSource, out [IPS\\_Service\\_t](#) ActiveInService) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Gets for a certain output service, the active input service.*

- void [DCM::DeviceControl::SetServiceBU\\_SwitchToGoodSrcOnly](#) (in unsigned short Board, in boolean Enabled) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Sets for service backup that the switch to the backup service will only happen if this service is not in alarm.*

- void `DCM::DeviceControl::GetServiceBU_SwitchToGoodSrcOnly` (in unsigned short Board, out boolean Enabled) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Gets for service backup if the switch to the backup service will only happen if this service is not in alarm.*
- void `DCM::DeviceControl::SetServiceBU_BackupL_V2` (in IPS\_Service\_t OutService, in AltSrcBU\_Setting\_t AltSrcBU\_Setting) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Sets the ServiceBackupList of an output service for a certian alternate source.*

- void `DCM::DeviceControl::GetServiceBU_BackupL_V2` (in IPS\_Service\_t OutService, in AlternateSrcIdList\_t AlternateSrcIdList, out AltSrcBU\_SettingList\_t AltSrcBU\_SettingList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Gets the Backup services for all alternate sources of an output service.*

- void `DCM::DeviceControl::SetActiveInputService_V2` (in IPS\_Service\_t OutService, in AltSrcMergeActiveInSvc\_t AltSrcMergeActiveInSvc) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Lets the user activate for a certain output service, the input service to be used.*

- void `DCM::DeviceControl::GetActiveInputServices_V2` (in IPS\_Service\_t OutService, in AlternateSrcIdList\_t AlternateSrcIdList, out AltSrcMergeActiveInSvcList\_t AltSrcMergeActiveInSvcList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Gets for a certain output service, the active input services for all its alternate sources.*

- void `DCM::DeviceControl::BoardBU_SvcSourcesActivate` (in unsigned short BoardNr, in ServiceSourcePriority\_t SourcePrio) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Lets the user activate for a all active alternate output services on a board the main or backup service sources.*

- void `DCM::DeviceControl::OutTS_BU_SvcSource_ActivateL` (in IPS\_Ref\_t PhysRef, in TsOutSvcSourceSelectionList\_t TsOutSvcSourceSelectionList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Lets the user activate for all active alternate output services of one or more output transport streams, the main or backup service sources.*

### 8.52.1 Detailed Description

In this group different backup type definitions, enums and methods are defined.

### 8.52.2 Typedef Documentation

#### 8.52.2.1 typedef sequence<AltSrcBU\_Setting\_t> DCM::DeviceControl::AltSrcBU\_SettingList\_t

Definition at line 23208 of file DCM.idl.

#### 8.52.2.2 typedef sequence<AltSrcMergeActiveInSvc\_t> DCM::DeviceControl::AltSrcMergeActiveInSvcList\_t

Definition at line 23252 of file DCM.idl.

#### 8.52.2.3 typedef sequence<BackupService\_t> DCM::DeviceControl::BackupServiceList\_t

Definition at line 23051 of file DCM.idl.

#### 8.52.2.4 typedef sequence<BackupSrvTable\_t> DCM::DeviceControl::BackupSrvTableList\_t

Definition at line 23060 of file DCM.idl.

### 8.52.2.5 typedef sequence<TsOutSvcSourceSelection\_t> DCM::DeviceControl::TsOutSvcSourceSelectionList\_t

Definition at line 23301 of file DCM.idl.

## 8.52.3 Enumeration Type Documentation

### 8.52.3.1 enum DCM::DeviceControl::eServiceBackupMode\_t

Enumerator:

*eSBU\_NonRevertive*

*eSBU\_Revertive*

*eSBU\_Floating* In this mode a switch will happen when the active source is bad < and any other good source is available.

Definition at line 23086 of file DCM.idl.

### 8.52.3.2 enum DCM::DeviceControl::ServiceSourcePriority\_t

Enumerator:

*eMainPriority*

*eHighestBackupPriority*

*eReservedPriority1*

*eReservedPriority2*

*eReservedPriority3*

*eReservedPriority4*

*eReservedPriority5*

*eReservedPriority6*

*eReservedPriority7*

Definition at line 23282 of file DCM.idl.

## 8.52.4 Function Documentation

### 8.52.4.1 void DCM::DeviceControl::BoardBU\_SvcSourcesActivate ( in unsigned short *BoardNr*, in ServiceSourcePriority\_t *SourcePrio* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Lets the user activate for a all active alternate output services on a board the main or backup service sources.  
(also for all active merged services)

#### Parameters

|    |                   |                                                                                      |
|----|-------------------|--------------------------------------------------------------------------------------|
| in | <i>BoardNr</i>    | specifies for which (output) board the call is meant                                 |
| in | <i>SourcePrio</i> | specifies which source should be activated (main or highest priority backup source). |

**Exceptions**

|                       |                                            |
|-----------------------|--------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing. |
| <i>OpNotSupported</i> | when BoardNr = 0 = Main board.             |
| <i>OpNotSucceeded</i> | Invalid priority given.                    |
| <i>OpNotAllowed</i>   | Not logged on                              |

**Version**

Release 8.0

**8.52.4.2** void DCM::DeviceControl::GetActiveInputService ( in IPS\_Service\_t *OutService*, in IPS\_Service\_t *InMergeSvcSource*, out IPS\_Service\_t *ActiveInService* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets for a certain output service, the active input service.

**Parameters**

|     |                         |                                                                           |
|-----|-------------------------|---------------------------------------------------------------------------|
| in  | <i>OutService</i>       | Service where the active source should is requested from.                 |
| in  | <i>InMergeSvcSource</i> | Merged service reference where the active source should is requested from |
| out | <i>ActiveInService</i>  | Active input service source                                               |

**Exceptions**

|                       |                                |
|-----------------------|--------------------------------|
| <i>OpNotSupported</i> | when BoardNr = 0 = Main board. |
| <i>OpNotSucceeded</i> | Invalid service reference.     |

**8.52.4.3** void DCM::DeviceControl::GetActiveInputServices\_V2 ( in IPS\_Service\_t *OutService*, in AlternateSrcIdList\_t *AlternateSrcIdList*, out AltSrcMergeActiveInSvcList\_t *AltSrcMergeActiveInSvcList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets for a certain output service, the active input services for all its alternate sources.

**Parameters**

|     |                                   |                                                                                                                                    |
|-----|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| in  | <i>OutService</i>                 | Service where the active source should is requested from.                                                                          |
| in  | <i>AlternateSrcIdList</i>         | The IDs of the alternate sources for which settings are requested. If empty, then settings of all services on the TS are returned. |
| out | <i>AltSrcMergeActiveInSvcList</i> | Active input service sources                                                                                                       |

**Exceptions**

|                       |                                |
|-----------------------|--------------------------------|
| <i>OpNotSupported</i> | when BoardNr = 0 = Main board. |
| <i>OpNotSucceeded</i> | Invalid service reference.     |

**Version**

Release 7.1

**8.52.4.4** void DCM::DeviceControl::GetServiceBU\_BackupL ( in IPS\_Service\_t *OutService*, out BackupSrvTableList\_t *BackupSrvList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the ServiceBackupList of an output service.

#### Parameters

|     |                      |                                                                       |
|-----|----------------------|-----------------------------------------------------------------------|
| in  | <i>OutService</i>    | specifies BoardNr, PortNr, TS and output SID to get the BuSrv-List of |
| out | <i>BackupSrvList</i> | List backup input services                                            |

#### Exceptions

|                       |                                                                                                                            |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | when BoardNr = 0 = Main board.                                                                                             |
| <i>OpNotSucceeded</i> | in case of <ul style="list-style-type: none"> <li>Invalid OutputService reference (BoardNr, PortNr, TS and SID)</li> </ul> |

**8.52.4.5** void DCM::DeviceControl::GetServiceBU\_BackupL\_V2 ( in IPS\_Service\_t *OutService*, in AlternateSrcIdList\_t *AlternateSrcIdList*, out AltSrcBU\_SettingList\_t *AltSrcBU\_SettingList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the Backup services for all alternate sources of an output service.

#### Parameters

|     |                             |                                                                                                                                    |
|-----|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| in  | <i>OutService</i>           | specifies BoardNr, PortNr, TS and output SID to get the BuSrv-List of                                                              |
| in  | <i>AlternateSrcIdList</i>   | The IDs of the alternate sources for which settings are requested. If empty, then settings of all services on the TS are returned. |
| out | <i>AltSrcBU_SettingList</i> | List backup input services                                                                                                         |

#### Exceptions

|                       |                                                                                                                            |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | when BoardNr = 0 = Main board.                                                                                             |
| <i>OpNotSucceeded</i> | in case of <ul style="list-style-type: none"> <li>Invalid OutputService reference (BoardNr, PortNr, TS and SID)</li> </ul> |

#### Version

Release 7.1

**8.52.4.6** void DCM::DeviceControl::GetServiceBU\_Params ( in IPS\_Service\_t *OutService*, out ServiceBackupParams\_t *ServiceBackupParams* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the ServiceBackup parameters of an output service.

Obsolete from V6.0 onwards. If the mode is floating (not supported in this IIOP call), then Revertive false will be returned.

**Parameters**

|     |                             |                                                                      |
|-----|-----------------------------|----------------------------------------------------------------------|
| in  | <i>OutService</i>           | specifies BoardNr, PortNr, TS and output SID to get the BU-params of |
| out | <i>ServiceBackup-Params</i> | BU-parameters                                                        |

**Exceptions**

|                       |                                                                                                                            |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | when BoardNr = 0 = Main board.                                                                                             |
| <i>OpNotSucceeded</i> | in case of <ul style="list-style-type: none"> <li>Invalid OutputService reference (BoardNr, PortNr, TS and SID)</li> </ul> |

**8.52.4.7** void DCM::DeviceControl::GetServiceBU\_Params2 ( in IPS\_Service\_t *OutService*, out ServiceBackupParams2\_t *ServiceBackupParams2* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the ServiceBackup parameters of an output service.

Supported from V6.0 onwards.

**Parameters**

|     |                              |                                                                      |
|-----|------------------------------|----------------------------------------------------------------------|
| in  | <i>OutService</i>            | specifies BoardNr, PortNr, TS and output SID to get the BU-params of |
| out | <i>ServiceBackup-Params2</i> | BU-parameters                                                        |

**Exceptions**

|                       |                                                                                                                            |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | when BoardNr = 0 = Main board.                                                                                             |
| <i>OpNotSucceeded</i> | in case of <ul style="list-style-type: none"> <li>Invalid OutputService reference (BoardNr, PortNr, TS and SID)</li> </ul> |

**8.52.4.8** void DCM::DeviceControl::GetServiceBU\_SwitchToGoodSrcOnly ( in unsigned short *Board*, out boolean *Enabled* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets for service backup if the switch to the backup service will only happen if this service is not in alarm.

**Parameters**

|     |                |                                                                                            |
|-----|----------------|--------------------------------------------------------------------------------------------|
| in  | <i>Board</i>   |                                                                                            |
| out | <i>Enabled</i> | TRUE if the switch to the backup service will only happen if this service is not in alarm. |

**Exceptions**

|                       |                              |
|-----------------------|------------------------------|
| <i>OpNotSupported</i> | when Board = 0 = Main board. |
| <i>OpNotSucceeded</i> | if Board is invalid          |

**8.52.4.9** void DCM::DeviceControl::OutTS\_BU\_SvcSource\_ActivateL ( in IPS\_Ref\_t *PhysRef*, in TsOutSvcSourceSelectionList\_t *TsOutSvcSourceSelectionList* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Lets the user activate for all active alternate output services of one or more output transport streams, the main or backup service sources.

(also for all active merged services)

#### Parameters

|    |                                    |                                                      |
|----|------------------------------------|------------------------------------------------------|
| in | <i>PhysRef</i>                     | The port the OutTS are attached to. ANY_PORT allowed |
| in | <i>TsOutSvcSourceSelectionList</i> | List of RefTs/SvcSourceSelection                     |

#### Exceptions

|                       |                                                                                                                                                                                                  |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Timeout</i>        | A timeout occurred during IIOP processing.                                                                                                                                                       |
| <i>OpNotSupported</i> | when BoardNr = 0 = Main board.                                                                                                                                                                   |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>• PhysRef does not exist</li> <li>• ServiceSourcePriority_t out of range</li> <li>• RefTs does not match PhysRef or cannot be found</li> </ul> |
| <i>OpNotAllowed</i>   | Not logged on.                                                                                                                                                                                   |

#### Version

Release 8.0

**8.52.4.10** void DCM::DeviceControl::SetActiveInputService ( in IPS\_Service\_t *OutService*, in IPS\_Service\_t *InMergeSvcSource*, in IPS\_Service\_t *ActiveInService* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Lets the user activate for a certain output service, the input service to be used.

If it appears that the chosen input service is in alarm, the input will automatically switch to another backup input service after the specified delay time. If the revertive setting is activated then the service will switch back to the original service if that service is active

#### Parameters

|    |                         |                                                                               |
|----|-------------------------|-------------------------------------------------------------------------------|
| in | <i>OutService</i>       | Service where the active source should be set.                                |
| in | <i>InMergeSvcSource</i> | Merged service reference for wich a certain input service source is activated |
| in | <i>ActiveInService</i>  | Input service source to be activated                                          |

#### Exceptions

|                       |                                |
|-----------------------|--------------------------------|
| <i>OpNotSupported</i> | when BoardNr = 0 = Main board. |
| <i>OpNotSucceeded</i> | Invalid service reference.     |

**8.52.4.11** void DCM::DeviceControl::SetActiveInputService\_V2 ( in IPS\_Service\_t *OutService*, in AltSrcMergeActiveInSvc\_t *AltSrcMergeActiveInSvc* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Lets the user activate for a certain output service, the input service to be used.

#### Parameters

|    |                               |                                                |
|----|-------------------------------|------------------------------------------------|
| in | <i>OutService</i>             | Service where the active source should be set. |
| in | <i>AltSrcMergeActiveInSvc</i> | the backup service to activate                 |

#### Exceptions

|                       |                                |
|-----------------------|--------------------------------|
| <i>OpNotSupported</i> | when BoardNr = 0 = Main board. |
| <i>OpNotSucceeded</i> | Invalid service reference.     |

#### Version

Release 7.1

**8.52.4.12** void DCM::DeviceControl::SetServiceBU\_BackupL ( in IPS\_Service\_t *OutService*, in BackupSrvTableList\_t *BackupSrvList* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Sets the ServiceBackupList of an output service.

#### Parameters

|    |                      |                                                                        |
|----|----------------------|------------------------------------------------------------------------|
| in | <i>OutService</i>    | specifies BoardNr, PortNr, TS and output SID to set the BuSrv-List for |
| in | <i>BackupSrvList</i> | List of backup input services                                          |

#### Exceptions

|                       |                                                                                                                                                                                                                    |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | when BoardNr = 0 = Main board.                                                                                                                                                                                     |
| <i>OpNotSucceeded</i> | in case of <ul style="list-style-type: none"> <li>Invalid OutputService reference (BoardNr, PortNr, TS and SID)</li> <li>number of backup services in BackupSrvList.BackupSvcList.BackupService &gt; 1.</li> </ul> |

#### Note

Only one backup service can be specified

From Release V8.2.87 onwards it is possible to specify up to 8 backup services

**8.52.4.13** void DCM::DeviceControl::SetServiceBU\_BackupL\_V2 ( in IPS\_Service\_t *OutService*, in AltSrcBU\_Setting\_t *AltSrcBU\_Setting* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Sets the ServiceBackupList of an output service for a certian alternate source.

**Parameters**

|    |                         |                                                                        |
|----|-------------------------|------------------------------------------------------------------------|
| in | <i>OutService</i>       | specifies BoardNr, PortNr, TS and output SID to set the BuSrv-List for |
| in | <i>AltSrcBU-Setting</i> | The settings that contain the backup sources                           |

**Exceptions**

|                       |                                                                                                                                                                                                                 |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | when BoardNr = 0 = Main board.                                                                                                                                                                                  |
| <i>OpNotSucceeded</i> | in case of <ul style="list-style-type: none"> <li>Invalid OutService reference (BoardNr, PortNr, TS and SID)</li> <li>number of backup services in BackupSrvList.BackupSvcList.BackupService &gt; 1.</li> </ul> |

**Note**

Only one backup service can be specified

From Release V8.2.87 onwards it is possible to specify up to 8 backup services

**Version**

Release 7.1

**8.52.4.14** void DCM::DeviceControl::SetServiceBU\_Params ( in IPS\_Service\_t *OutService*, in ServiceBackupParams\_t *ServiceBackupParams* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Sets the ServiceBackup parameters for an output service.

Obsolete from V6.0 onwards.

**Parameters**

|    |                             |                                                                       |
|----|-----------------------------|-----------------------------------------------------------------------|
| in | <i>OutService</i>           | specifies BoardNr, PortNr, TS and output SID to set the BU-params for |
| in | <i>ServiceBackup-Params</i> | BU-parameters                                                         |

**Exceptions**

|                       |                                                                                                                         |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | when BoardNr = 0 = Main board.                                                                                          |
| <i>OpNotSucceeded</i> | in case of <ul style="list-style-type: none"> <li>Invalid OutService reference (BoardNr, PortNr, TS and SID)</li> </ul> |

**8.52.4.15** void DCM::DeviceControl::SetServiceBU\_Params2 ( in IPS\_Service\_t *OutService*, in ServiceBackupParams2\_t *ServiceBackupParams2* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Sets the ServiceBackup parameters for an output service.

Supported from V6.0 onwards.

**Parameters**

|    |                              |                                                                       |
|----|------------------------------|-----------------------------------------------------------------------|
| in | <i>OutService</i>            | specifies BoardNr, PortNr, TS and output SID to set the BU-params for |
| in | <i>ServiceBackup-Params2</i> | BU-parameters                                                         |

**Exceptions**

|                       |                                                                                                                                                                                        |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | when BoardNr = 0 = Main board.                                                                                                                                                         |
| <i>OpNotSucceeded</i> | in case of <ul style="list-style-type: none"> <li>• Invalid OutService reference (BoardNr, PortNr, TS and SID)</li> <li>• Invalid mode specified in the ServiceBackupParams</li> </ul> |

**8.52.4.16** void DCM::DeviceControl::SetServiceBU\_SwitchToGoodSrcOnly ( in unsigned short *Board*, in boolean *Enabled* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Sets for service backup that the switch to the backup service will only happen if this service is not in alarm.

**Parameters**

|    |                |                                                                                            |
|----|----------------|--------------------------------------------------------------------------------------------|
| in | <i>Board</i>   |                                                                                            |
| in | <i>Enabled</i> | TRUE if the switch to the backup service will only happen if this service is not in alarm. |

**Exceptions**

|                       |                              |
|-----------------------|------------------------------|
| <i>OpNotSupported</i> | when Board = 0 = Main board. |
| <i>OpNotSucceeded</i> | if Board is invalid          |

## 8.53 TS and Service Backup

Collaboration diagram for TS and Service Backup:

### Classes

- struct `DCM::DeviceControl::ServiceLossTrigger_t`
- struct `DCM::DeviceControl::TS_LossTrigger_t`

### Typedefs

- typedef unsigned long `DCM::DeviceControl::TriggerBitmap_t`  
*Bitmap of triggers.*
- typedef sequence < `ServiceLossTrigger_t` > `DCM::DeviceControl::ServiceLossTriggerList_t`  
*A sequence of `ServiceLossTrigger_t`.*
- typedef sequence < `TS_LossTrigger_t` > `DCM::DeviceControl::TS_LossTriggerList_t`  
*A sequence of `TS_LossTrigger_t`.*

### Functions

- void `DCM::DeviceControl::SetDefaultServiceLossTriggers` (in `IPS_Ref_t RefPhys`, in `TriggerBitmap_t TriggerBitmap`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Set the default Service Loss Alarm triggers.*
- void `DCM::DeviceControl::GetDefaultServiceLossTriggers` (in `IPS_Ref_t RefPhys`, out `TriggerBitmap_t TriggerBitmap`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get the default Service Loss Alarm triggers.*
- void `DCM::DeviceControl::SetDefaultTS_LossTriggers` (in unsigned short Board, in `TriggerBitmap_t TriggerBitmap`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Set the default TS Loss Alarm triggers.*
- void `DCM::DeviceControl::GetDefaultTS_LossTriggers` (in unsigned short Board, out `TriggerBitmap_t TriggerBitmap`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get the default TS Loss Alarm triggers.*
- void `DCM::DeviceControl::SetServiceLossTriggers` (in `IPS_RefTS_t RefTS`, in `ServiceLossTriggerList_t TriggerList`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Set the service loss triggers for specified services on given TS.*
- void `DCM::DeviceControl::ResetServiceLossTriggers` (in `IPS_RefTS_t RefTS`, in `ServiceIdList_t InputSidList`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Reset the service loss triggers for specified services on given TS.*

- void [DCM::DeviceControl::GetServiceLossTriggers](#) (in IPS\_RefTS\_t RefTS, in ServiceIdList\_t - InputSidList, out ServiceLossTriggerList\_t TriggerList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get the service loss triggers for all or specified input services on given Port and TS.*
- void [DCM::DeviceControl::SetTS\\_LossTriggers](#) (in IPS\_Ref\_t Ref, in TS\_LossTriggerList\_t TriggerList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Set the TS loss triggers for specified TS's on given port.*
- void [DCM::DeviceControl::ResetTS\\_LossTriggers](#) (in IPS\_Ref\_t Ref, in Ref\_List\_t RefList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Reset the TS loss triggers for specified TS's on given port.*
- void [DCM::DeviceControl::GetTS\\_LossTriggers](#) (in IPS\_Ref\_t Ref, in Ref\_List\_t RefList, out TS\_LossTriggerList\_t TriggerList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the TS loss triggers for all or specified input TS's on given Port.*

### 8.53.1 Typedef Documentation

#### 8.53.1.1 typedef sequence< ServiceLossTrigger\_t > DCM::DeviceControl::ServiceLossTriggerList\_t

A sequence of [ServiceLossTrigger\\_t](#).

Definition at line 20851 of file DCM.idl.

#### 8.53.1.2 typedef unsigned long DCM::DeviceControl::TriggerBitmap\_t

Bitmap of triggers.

For service loss triggers the bits have following meaning.

- bit 0: indicates that active link loss should be used as trigger. (Supported after 3.0).
- bit 1: indicates that UDP loss should be used as trigger. (Supported after 3.0).
- bit 2: indicated that UDP stream loss should be used as trigger.
- bit 3: indicates that ASI/8VSB/DVBS2 sync loss should be used as trigger.
- bit 4: indicates that any pid error should be used as trigger.
- bit 5: indicates that "smart" pid error should be used as trigger. (Supported after 3.0).
- bit 6: indicates that a pid list error should be used as trigger.
- bit 7: indicates that PMT error should be used as trigger.
- bit 8: indicates that missing in PAT should be used as trigger (only for routed services).
- bit 9: indicates that a scrambled input should be used as trigger (Supported after 4.5).
- bit 10: indicates that any pid bitrate too low should be used as trigger.
- bit 11: indicates that "smart" bitrate too low should be used as trigger.
- bit 12: indicates that a pid list for bitrate too low should be used as trigger.
- bit 13: indicates that hardware GPI contact 1 should be used as trigger.
- bit 14: indicates that hardware GPI contact 2 should be used as trigger.

- bit 15: indicates that hardware GPI contact 3 should be used as trigger.
- bit 16: indicates that hardware GPI contact 4 should be used as trigger.
- bit 17: indicates that hardware GPI contact 5 should be used as trigger.
- bit 18: indicates that a not descrambled pid should be used as trigger (from 8.9 on).
- bit 19: indicates that an attempt to descramble a pid in the clear should be used as trigger (from 8.9 on).
- bit 20: indicates that MFP video loss should be used as trigger (from 10.1 on).
- bit 21: indicates that MFP audio loss should be used as trigger (from 10.10 on).
- bit 22: indicates that MFP SD/HD mismatch should be used as trigger (from 11.10 on).
- bit 23: indicates that MFP MPEG/AVC mismatch should be used as trigger (from 11.10 on).

For TS loss triggers the bits have following meaning.

- bit 0: indicates that active link loss should be used as trigger. (Supported from 7.1 onwards).
- bit 1: indicates that UDP loss should be used as trigger. (Supported from 7.1 onwards).
- bit 2: indicated that UDP stream loss should be used as trigger.
- bit 3: indicates that ASI sync loss should be used as trigger.
- bit 4: indicates that sync byte error should be used as trigger.
- bit 5: indicates that service loss should be used as trigger.
- bit 6: indicates that PAT error should be used as trigger. (Supported from 7.1 onwards).
- bit 7: indicates that a not descrambled pid should be used as trigger (from 8.9 on).

Definition at line 20786 of file DCM.idl.

#### 8.53.1.3 typedef sequence<TS\_LossTrigger\_t> DCM::DeviceControl::TS\_LossTriggerList\_t

A sequence of [TS\\_LossTrigger\\_t](#).

Definition at line 20916 of file DCM.idl.

### 8.53.2 Function Documentation

**8.53.2.1** void DCM::DeviceControl::GetDefaultServiceLossTriggers ( in IPS\_Ref\_t *RefPhys*, out TriggerBitmap\_t *TriggerBitmap* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the default Service Loss Alarm triggers.

#### Parameters

|     |                      |                               |
|-----|----------------------|-------------------------------|
| in  | <i>RefPhys</i>       | specifies BoardNr and PortNr. |
| out | <i>TriggerBitmap</i> |                               |

**Exceptions**

|                       |                                                          |
|-----------------------|----------------------------------------------------------|
| <i>OpNotSupported</i> | when BoardNr = 0 = Main board.                           |
| <i>OpNotSucceeded</i> | in case of invalid references RefPhys (BoardNr, PortNr). |

**8.53.2.2** void DCM::DeviceControl::GetDefaultTS\_LossTriggers ( in unsigned short *Board*, out TriggerBitmap\_t *TriggerBitmap* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the default TS Loss Alarm triggers.

**Parameters**

|     |                      |                    |
|-----|----------------------|--------------------|
| in  | <i>Board</i>         | specifies BoardNr. |
| out | <i>TriggerBitmap</i> |                    |

**Exceptions**

|                       |                                |
|-----------------------|--------------------------------|
| <i>OpNotSupported</i> | when BoardNr = 0 = Main board. |
|-----------------------|--------------------------------|

**8.53.2.3** void DCM::DeviceControl::GetServiceLossTriggers ( in IPS\_RefTS\_t *RefTS*, in ServiceIdList\_t *InputSidList*, out ServiceLossTriggerList\_t *TriggerList* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the service loss triggers for all or specified input services on given Port and TS.

**Parameters**

|     |                     |                                                                                   |
|-----|---------------------|-----------------------------------------------------------------------------------|
| in  | <i>RefTS</i>        | specifies BoardNr, PortNr and TS. wildcard RefTS.Ref == INVALID_REF for all TS's. |
| in  | <i>InputSidList</i> | when empty, the triggers for ALL services are given.                              |
| out | <i>TriggerList</i>  |                                                                                   |

**Exceptions**

|                       |                                                                                                                                                                                                |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | when BoardNr = 0 = Main board.                                                                                                                                                                 |
| <i>OpNotSucceeded</i> | in case of <ul style="list-style-type: none"> <li>Invalid reference RefTS (BoardNr, PortNr and TS).</li> <li>Not existent TS or not an input TS.</li> <li>Not existent service ID's</li> </ul> |

**Note**

TriggerList.PidList will be empty if bit 6 (PID list error) or bit 12 (PID list bitrate error) of TriggerList.TriggerBitmap is FALSE. Not supported bits in TriggerList.TriggerBitmap will always be 0.

**8.53.2.4** void DCM::DeviceControl::GetTS\_LossTriggers ( in IPS\_Ref\_t *Ref*, in Ref\_List\_t *RefList*, out TS\_LossTriggerList\_t *TriggerList* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the TS loss triggers for all or specified input TS's on given Port.

**Parameters**

|     |                    |                                                                               |
|-----|--------------------|-------------------------------------------------------------------------------|
| in  | <i>Ref</i>         | specifies BoardNr, PortNr. wildcard Ref.PortNr == INVALID_PORT for all ports. |
| in  | <i>RefList</i>     | when empty, the triggers for ALL TS's are given.                              |
| out | <i>TriggerList</i> |                                                                               |

**Exceptions**

|                       |                                                                                                                                                      |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | when BoardNr = 0 = Main board.                                                                                                                       |
| <i>OpNotSucceeded</i> | in case of <ul style="list-style-type: none"> <li>Invalid reference RefTS (BoardNr, PortNr).</li> <li>Not existent TS or not an input TS.</li> </ul> |

**Remarks**

Not supported bits in TriggerList.TriggerBitmap will always be 0.  
When no input TS's are found on given port, an empty list is returned.

**8.53.2.5** void DCM::DeviceControl::ResetServiceLossTriggers ( in IPS\_RefTS\_t *RefTS*,  
in ServiceIdList\_t *InputSidList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed,  
OpNotSupported)

Reset the service loss triggers for specified services on given TS.

This call serves to let given service(s) follow the default. The service specific bitmap and eventual pid list are cleared.

**Parameters**

|    |                     |                                                                                 |
|----|---------------------|---------------------------------------------------------------------------------|

**8.53.2.6** void DCM::DeviceControl::ResetTS\_LossTriggers ( in IPS\_Ref\_t *Ref*, in Ref\_List\_t *RefList*  
) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Reset the TS loss triggers for specified TS's on given port.

This call serves to let given TS(s) follow the board default. The TS specific bitmap is cleared.

**Parameters**

|    |            |                            |
|----|------------|----------------------------|
| in | <i>Ref</i> | specifies BoardNr, PortNr. |

## 8.54 1:1 Device Backup

Collaboration diagram for 1:1 Device Backup:

### Classes

- struct `DCM::DeviceControl::DeviceBackupLink_t`  
*Configuration of a link between 2 devices for use with Device Backup.*
- struct `DCM::DeviceControl::DeviceBackupParams_t`
- struct `DCM::DeviceControl::DeviceBackupParamsV2_t`  
*Following combinations of Roles and Modes are valid:*
- struct `DCM::DeviceControl::AlarmTriggerRule_t`
- struct `DCM::DeviceControl::RestoreOption`  
*Single settings restore option.*
- struct `DCM::DeviceControl::RestoreOption_V2`  
*Single settings restore option.*

### Typedefs

- typedef sequence < DeviceBackupLink\_t > `DCM::DeviceControl::DeviceBackupLinkList_t`
- typedef sequence < AlarmTriggerRule\_t > `DCM::DeviceControl::AlarmTriggerRuleList`
- typedef sequence < RestoreOption > `DCM::DeviceControl::RestoreOptions`  
*List of options.*
- typedef sequence < RestoreOption\_V2 > `DCM::DeviceControl::RestoreOptions_V2`  
*List of options.*

### Enumerations

- enum `DCM::DeviceControl::eDeviceActiveMode` { `DCM::DeviceControl::DeviceMode_Active`, `DCM::DeviceControl::DeviceMode_Inactive` }
- enum `DCM::DeviceControl::eDeviceRole` { `DCM::DeviceControl::DeviceRole_Standalone`, `DCM::DeviceControl::DeviceRole_Main`, `DCM::DeviceControl::DeviceRole_Backup` }
- enum `DCM::DeviceControl::eDeviceRole_V2` { `DCM::DeviceControl::DeviceRole_V2_Standalone`, `DCM::DeviceControl::DeviceRole_V2_Main`, `DCM::DeviceControl::DeviceRole_V2_Backup`, `DCM::DeviceControl::DeviceRole_V2_Single`, `DCM::DeviceControl::DeviceRole_V2_LiveLive`, `DCM::DeviceControl::DeviceRole_V2_Reserved_005`, `DCM::DeviceControl::DeviceRole_V2_Reserved_004`, `DCM::DeviceControl::DeviceRole_V2_Reserved_003`, `DCM::DeviceControl::DeviceRole_V2_Reserved_002`, `DCM::DeviceControl::DeviceRole_V2_Reserved_001` }

- enum `DCM::DeviceControl::eDBURevertMode` { `DCM::DeviceControl::DBURevertMode_None`, `DCM::DeviceControl::DBURevertMode_Revertive`, `DCM::DeviceControl::DBURevertMode_Floating`, `DCM::DeviceControl::DBURevertMode_Reserved_003`, `DCM::DeviceControl::DBURevertMode_Reserved_004`, `DCM::DeviceControl::DBURevertMode_Reserved_005` }
- enum `DCM::DeviceControl::eActivationMode` { `DCM::DeviceControl::ActivationMode_Active`, `DCM::DeviceControl::ActivationMode_Inactive`, `DCM::DeviceControl::ActivationMode_Auto` }
- enum `DCM::DeviceControl::eRestoreOption` { `DCM::DeviceControl::Restore_NoGbeNetwork`, `DCM::DeviceControl::Restore_NoDeviceBackup`, `DCM::DeviceControl::Restore_NoSCS`, `DCM::DeviceControl::Restore_NoSettingsBackup`, `DCM::DeviceControl::Restore_NoNTP`, `DCM::DeviceControl::Restore_NoIPsec`, `DCM::DeviceControl::Restore_NoStaticRouteMB`, `DCM::DeviceControl::Restore_NoDcCfgMgr`, `DCM::DeviceControl::Restore_NoIcmpV2GbE`, `DCM::DeviceControl::Restore_NoBasicNetwork` }

*Single settings restore option type. Deprecated, use the V2 versions instead.*

- enum `DCM::DeviceControl::eRestoreSettingsResult` { `DCM::DeviceControl::Restore_Done`, `DCM::DeviceControl::Restore_Reboot`, `DCM::DeviceControl::Restore_Busy`, `DCM::DeviceControl::Restore_Error`, `DCM::DeviceControl::Restore_Result_Reserved1`, `DCM::DeviceControl::Restore_Result_Reserved2`, `DCM::DeviceControl::Restore_Result_Reserved3`, `DCM::DeviceControl::Restore_Result_Reserved4` }

*Result of the settings restore call.*

- enum `DCM::DeviceControl::eRestoreOption_V2` { `DCM::DeviceControl::Restore_V2_NoGbeNetwork`, `DCM::DeviceControl::Restore_V2_NoDeviceBackup`, `DCM::DeviceControl::Restore_V2_NoSCS`, `DCM::DeviceControl::Restore_V2_NoSettingsBackup`, `DCM::DeviceControl::Restore_V2_NoNTP`, `DCM::DeviceControl::Restore_V2_NoIPsec`, `DCM::DeviceControl::Restore_V2_NoStaticRouteMB`, `DCM::DeviceControl::Restore_V2_NoDcCfgMgr`, `DCM::DeviceControl::Restore_V2_NoIcmpV2GbE`, `DCM::DeviceControl::Restore_V2_NoBasicNetwork`, `DCM::DeviceControl::Restore_V2_NoPsbSec`, `DCM::DeviceControl::Restore_V2_Reserved_20`, `DCM::DeviceControl::Restore_V2_Reserved_19`, `DCM::DeviceControl::Restore_V2_Reserved_18`, `DCM::DeviceControl::Restore_V2_Reserved_17`, `DCM::DeviceControl::Restore_V2_Reserved_16`, `DCM::DeviceControl::Restore_V2_Reserved_15`, `DCM::DeviceControl::Restore_V2_Reserved_14`, `DCM::DeviceControl::Restore_V2_Reserved_13`, `DCM::DeviceControl::Restore_V2_Reserved_12`, `DCM::DeviceControl::Restore_V2_Reserved_11`, `DCM::DeviceControl::Restore_V2_Reserved_10`, `DCM::DeviceControl::Restore_V2_Reserved_9`, `DCM::DeviceControl::Restore_V2_Reserved_8`, `DCM::DeviceControl::Restore_V2_Reserved_7`, `DCM::DeviceControl::Restore_V2_Reserved_6`, `DCM::DeviceControl::Restore_V2_Reserved_5`, `DCM::DeviceControl::Restore_V2_Reserved_4`, `DCM::DeviceControl::Restore_V2_Reserved_3`, `DCM::DeviceControl::Restore_V2_Reserved_2`, `DCM::DeviceControl::Restore_V2_Reserved_1` }

*Single settings restore option type.*

## Functions

- void `DCM::DeviceControl::SetDeviceActiveMode` (in `eDeviceActiveMode DeviceActiveMode`) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Set the device mode.*
- void `DCM::DeviceControl::GetDeviceActiveMode` (out `eDeviceActiveMode DeviceActiveMode`) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Query the device mode.*
- void `DCM::DeviceControl::SetPowerupDeviceActiveMode` (in `eDeviceActiveMode DeviceActiveMode`) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Set the power-up device mode.*
- void `DCM::DeviceControl::GetPowerupDeviceActiveMode` (out `eDeviceActiveMode DeviceActiveMode`) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the power-up device mode.*

- void **DCM::DeviceControl::GetPeerDeviceActiveMode** (out eDeviceActiveMode DeviceActiveMode) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the peer device mode.*

- void **DCM::DeviceControl::SetDeviceBU\_Params** (in DeviceBackupParams\_t DeviceBackupParams) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Sets the parameters to be used by Device Backup.*

- void **DCM::DeviceControl::GetDeviceBU\_Params** (out DeviceBackupParams\_t DeviceBackupParams) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Gets the parameters used by Device Backup.*

- void **DCM::DeviceControl::SetDeviceBU\_ParamsV2** (in DeviceBackupParamsV2\_t DeviceBackupParams) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Sets the parameters to be used by Device Backup.*

- void **DCM::DeviceControl::GetDeviceBU\_ParamsV2** (out DeviceBackupParamsV2\_t DeviceBackupParams) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Gets the parameters used by Device Backup.*

- void **DCM::DeviceControl::DeviceBU\_ActivateDevice** () raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Instructs this device to gracefully become the active device.*

- void **DCM::DeviceControl::SetIP\_AliasMode** (in IPS\_Ref\_t RefPhys, in eActivationMode ActivationMode) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Set activation mode for the list of IP aliases associated with a specific network interface.*

- void **DCM::DeviceControl::GetIP\_AliasMode** (in IPS\_Ref\_t RefPhys, out eActivationMode ActivationMode) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get activation mode for the list of IP aliases associated with a specific network interface.*

- void **DCM::DeviceControl::SetIP\_AliasList** (in IPS\_Ref\_t RefPhys, in IP\_List\_t IP\_Addresses) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Set the list of IP aliases associated with a specific network interface.*

- void **DCM::DeviceControl::GetIP\_AliasList** (in IPS\_Ref\_t RefPhys, out IP\_List\_t IP\_Addresses) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the list of IP aliases associated with a specific network interface.*

- void **DCM::DeviceControl::SetDeviceBackupTriggers** (in MM\_IDList Triggers) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Sets the list of triggers that define when a backup is needed.*

- void **DCM::DeviceControl::GetDeviceBackupTriggers** (out MM\_IDList Triggers) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Gets the list of triggers that define when a backup is needed.*

- void **DCM::DeviceControl::SetCardNotOperationalTriggers** (in unsigned short Board, in AlarmTriggerRuleList Rules) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Set list alarm trigger rules for CardNotOperational.*

- void **DCM::DeviceControl::GetCardNotOperationalTriggers** (in unsigned short Board, out AlarmTriggerRuleList Rules) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get list alarm trigger rules for CardNotOperational.*

- void **DCM::DeviceControl::GetActiveCardNotOperTriggers** (in unsigned short Board, out MM\_IDList ActiveAlarms) raises (TimeOut, OpNotAllowed, OpNotSupported)

*Get list measurement references of all active alarms configured as trigger for backup.*

- void **DCM::DeviceControl::GetSettingsRestoreOptions** (out RestoreOptions options) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the restore options.*

- void [DCM::DeviceControl::SetSettingsRestoreOptions](#) (in RestoreOptions options) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Set restore options.*
- void [DCM::DeviceControl::BackupSettings](#) (out ByteStream settings) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Retrieve settings from the device.*
- void [DCM::DeviceControl::RestoreSettings](#) (in ByteStream settings) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Restore settings onto the device.*
- void [DCM::DeviceControl::BackupSettings2](#) (in unsigned short scope, out ByteStream settings) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Retrieve settings from the device.*
- void [DCM::DeviceControl::RestoreSettings2](#) (in unsigned short scope, in ByteStream settings) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Restore settings onto the device.*
- void [DCM::DeviceControl::RestoreSettings3](#) (in unsigned short scope, in ByteStream settings, in boolean bReturnEarly, out eRestoreSettingsResult Result) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Restore settings onto the device and try to do this seamless.*
- void [DCM::DeviceControl::PollRestoreSettingsResult](#) (out eRestoreSettingsResult Result) raises (-TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Check if the asynchronously launched RestoreSettingsAsync call has finished its job (poll for its status).*
- void [DCM::DeviceControl::GetSettingsRestoreOptions\\_V2](#) (out RestoreOptions\_V2 options) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get the restore options.*
- void [DCM::DeviceControl::SetSettingsRestoreOptions\\_V2](#) (in RestoreOptions\_V2 options) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Set restore options.*

### 8.54.1 Typedef Documentation

#### 8.54.1.1 typedef sequence<AlarmTriggerRule\_t> DCM::DeviceControl::AlarmTriggerRuleList

Definition at line 21410 of file DCM.idl.

#### 8.54.1.2 typedef sequence<DeviceBackupLink\_t> DCM::DeviceControl::DeviceBackupLinkList\_t

Definition at line 21133 of file DCM.idl.

#### 8.54.1.3 typedef sequence<RestoreOption> DCM::DeviceControl::RestoreOptions

List of options.

Definition at line 21483 of file DCM.idl.

#### 8.54.1.4 typedef sequence<RestoreOption\_V2> DCM::DeviceControl::RestoreOptions\_V2

List of options.

Definition at line 21695 of file DCM.idl.

### 8.54.2 Enumeration Type Documentation

#### 8.54.2.1 enum DCM::DeviceControl::eActivationMode

Enumerator:

*ActivationMode\_Active*  
*ActivationMode\_Inactive*  
*ActivationMode\_Auto*

Definition at line 21267 of file DCM.idl.

#### 8.54.2.2 enum DCM::DeviceControl::eDBURevertMode

Enumerator:

*DBURevertMode\_None* Device requires manual action after failover.  
*DBURevertMode\_Revertive* Device reverts to main when failure solved.  
*DBURevertMode\_Floating* Active device remains active until failure regardless of main/backup setting.  
*DBURevertMode\_Reserved\_003*  
*DBURevertMode\_Reserved\_004*  
*DBURevertMode\_Reserved\_005*

Definition at line 21105 of file DCM.idl.

#### 8.54.2.3 enum DCM::DeviceControl::eDeviceActiveMode

Enumerator:

*DeviceMode\_Active* Device is the active device.  
*DeviceMode\_Inactive* Device is the inactive device.

Definition at line 21000 of file DCM.idl.

#### 8.54.2.4 enum DCM::DeviceControl::eDeviceRole

Enumerator:

*DeviceRole\_Standalone* Device does not take part in device backup or is managed externally (e.g. ROSA EM)  
*DeviceRole\_Main* Device is main device.  
*DeviceRole\_Backup* Device is backup device.

Definition at line 21082 of file DCM.idl.

#### 8.54.2.5 enum DCM::DeviceControl::eDeviceRole\_V2

Enumerator:

*DeviceRole\_V2\_Standalone* Device does not take part in device backup or is managed externally (e.g. ROSA EM)  
*DeviceRole\_V2\_Main* Device is main device.  
*DeviceRole\_V2\_Backup* Device is backup device.

***DeviceRole\_V2\_Single*** Device acts solely upon its own status.

***DeviceRole\_V2\_LiveLive*** Device is in a live-live configuration.

***DeviceRole\_V2\_Reserved\_005***

***DeviceRole\_V2\_Reserved\_004***

***DeviceRole\_V2\_Reserved\_003***

***DeviceRole\_V2\_Reserved\_002***

***DeviceRole\_V2\_Reserved\_001***

Definition at line 21090 of file DCM.idl.

#### 8.54.2.6 enum DCM::DeviceControl::eRestoreOption

Single settings restore option type. Deprecated, use the V2 versions instead.

Enumerator:

***Restore\_NoGbeNetwork*** Exclude GbE Network settings (basic + vlan + igmp)

***Restore\_NoDeviceBackup*** Exclude 1:1 Device Backup settings.

***Restore\_NoSCS*** Exclude SCS settings.

***Restore\_NoSettingsBackup*** Exclude Settings Backup's own settings.

***Restore\_NoNTP*** Exclude NTP's drift file.

***Restore\_NoIPsec*** Exclude the IPsec settings file.

***Restore\_NoStaticRouteMB*** Exclude static routes for mainboard settings file.

***Restore\_NoDcCfgMgr*** Exclude DcCfgMgr settings.

***Restore\_NoIgmpV2GbE*** Exclude IgmpV2GbE settings (igmp)

***Restore\_NoBasicNetwork*** Exclude Basic network settings (basic)

Definition at line 21461 of file DCM.idl.

#### 8.54.2.7 enum DCM::DeviceControl::eRestoreOption\_V2

Single settings restore option type.

Enumerator:

***Restore\_V2\_NoGbeNetwork*** Exclude GbE Network settings (basic + vlan + igmp)

***Restore\_V2\_NoDeviceBackup*** Exclude 1:1 Device Backup settings.

***Restore\_V2\_NoSCS*** Exclude SCS settings.

***Restore\_V2\_NoSettingsBackup*** Exclude Settings Backup's own settings.

***Restore\_V2\_NoNTP*** Exclude NTP's drift file.

***Restore\_V2\_NoIPsec*** Exclude the IPsec settings file.

***Restore\_V2\_NoStaticRouteMB*** Exclude static routes for mainboard settings file.

***Restore\_V2\_NoDcCfgMgr*** Exclude DcCfgMgr settings.

***Restore\_V2\_NoIgmpV2GbE*** Exclude IgmpV2GbE settings (igmp)

***Restore\_V2\_NoBasicNetwork*** Exclude Basic network settings (basic)

***Restore\_V2\_NoPsbSec*** Exclude settings regarding product security.

*Restore\_V2\_Reserved\_20*  
*Restore\_V2\_Reserved\_19*  
*Restore\_V2\_Reserved\_18*  
*Restore\_V2\_Reserved\_17*  
*Restore\_V2\_Reserved\_16*  
*Restore\_V2\_Reserved\_15*  
*Restore\_V2\_Reserved\_14*  
*Restore\_V2\_Reserved\_13*  
*Restore\_V2\_Reserved\_12*  
*Restore\_V2\_Reserved\_11*  
*Restore\_V2\_Reserved\_10*  
*Restore\_V2\_Reserved\_9*  
*Restore\_V2\_Reserved\_8*  
*Restore\_V2\_Reserved\_7*  
*Restore\_V2\_Reserved\_6*  
*Restore\_V2\_Reserved\_5*  
*Restore\_V2\_Reserved\_4*  
*Restore\_V2\_Reserved\_3*  
*Restore\_V2\_Reserved\_2*  
*Restore\_V2\_Reserved\_1*

Definition at line 21652 of file DCM.idl.

#### 8.54.2.8 enum DCM::DeviceControl::eRestoreSettingsResult

Result of the settings restore call.

Enumerator:

*Restore\_Done* The settings restore has finished.  
*Restore\_Reboot* The settings restore will reboot to finish.  
*Restore\_Busy* The async call is still being processed.  
*Restore\_Error* The async call is done with errors.  
*Restore\_Result\_Reserved1*  
*Restore\_Result\_Reserved2*  
*Restore\_Result\_Reserved3*  
*Restore\_Result\_Reserved4*

Definition at line 21584 of file DCM.idl.

## 8.54.3 Function Documentation

**8.54.3.1** void DCM::DeviceControl::BackupSettings ( out ByteStream *settings* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Retrieve settings from the device.

## Parameters

|     |                 |                           |
|-----|-----------------|---------------------------|
| out | <i>settings</i> | Settings in binary format |
|-----|-----------------|---------------------------|

## Exceptions

|                       |                                            |
|-----------------------|--------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing. |
| <i>OpNotSucceeded</i> | Internal errors.                           |
| <i>OpNotAllowed</i>   | Not logged on.                             |
| <i>OpNotSupported</i> | /                                          |

**8.54.3.2** void DCM::DeviceControl::BackupSettings2 ( in unsigned short *scope*, out ByteStream *settings* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Retrieve settings from the device.

## Parameters

|     |                 |                                                                        |
|-----|-----------------|------------------------------------------------------------------------|
| in  | <i>scope</i>    | Scope of the operation: 0-n are normal boards, 0xFFFF is whole chassis |
| out | <i>settings</i> | Settings in binary format                                              |

## Exceptions

|                       |                                                                        |
|-----------------------|------------------------------------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing.                             |
| <i>OpNotSucceeded</i> | Internal errors or the specified card is not an active IP Adapter card |
| <i>OpNotAllowed</i>   | Not logged on.                                                         |
| <i>OpNotSupported</i> | /                                                                      |

**8.54.3.3** void DCM::DeviceControl::DeviceBU\_ActivateDevice ( ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Instructs this device to gracefully become the active device.

If the device is a main device then this call will result in a manual restore operation. If the device is a backup device then this call will result in a manual backup operation.

## Exceptions

|                       |                                                                  |
|-----------------------|------------------------------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing.                       |
| <i>OpNotAllowed</i>   | Not logged on.                                                   |
| <i>OpNotSupported</i> | When this call is not supported in the running software version. |
| <i>OpNotSucceeded</i> | On internal error only                                           |

**8.54.3.4** void DCM::DeviceControl::GetActiveCardNotOperTriggers ( in unsigned short *Board*, out MM\_IDList *ActiveAlarms* ) raises (Timeout, OpNotAllowed, OpNotSupported)

Get list measurement references of all active alarms configured as trigger for backup.

#### Parameters

|     |                     |                                                              |
|-----|---------------------|--------------------------------------------------------------|
| in  | <i>Board</i>        | Specifies BoardNr.                                           |
| out | <i>ActiveAlarms</i> | References of alarms that are triggering CardNotOperational. |

#### Exceptions

|                       |                                                                                                                                          |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Timeout</i>        | Never thrown.                                                                                                                            |
| <i>OpNotSucceeded</i> | in case of <ul style="list-style-type: none"> <li>• A timeout occurred during IIOP processing.</li> <li>• Invalid parameters.</li> </ul> |
| <i>OpNotAllowed</i>   | Not logged on.                                                                                                                           |
| <i>OpNotSupported</i> | Thrown if this call is not supported in the running software version.                                                                    |

**8.54.3.5** void DCM::DeviceControl::GetCardNotOperationalTriggers ( in unsigned short *Board*, out AlarmTriggerRuleList *Rules* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get list alarm trigger rules for CardNotOperational.

#### Parameters

|     |              |                                                 |
|-----|--------------|-------------------------------------------------|
| in  | <i>Board</i> | Specifies BoardNr.                              |
| out | <i>Rules</i> | rules defining triggers for CardNotOperational. |

#### Exceptions

|                       |                                                                                                                                          |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Timeout</i>        | Never thrown.                                                                                                                            |
| <i>OpNotSucceeded</i> | in case of <ul style="list-style-type: none"> <li>• A timeout occurred during IIOP processing.</li> <li>• Invalid parameters.</li> </ul> |
| <i>OpNotAllowed</i>   | Not logged on.                                                                                                                           |
| <i>OpNotSupported</i> | Thrown if this call is not supported in the running software version.                                                                    |

**8.54.3.6** void DCM::DeviceControl::GetDeviceActiveMode ( out eDeviceActiveMode *DeviceActiveMode* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Query the device mode.

#### Parameters

|     |                          |  |
|-----|--------------------------|--|
| out | <i>DeviceActive-Mode</i> |  |
|-----|--------------------------|--|

**Exceptions**

|                       |                                                                                                      |
|-----------------------|------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing.                                                           |
| <i>OpNotSucceeded</i> | On internal error only.                                                                              |
| <i>OpNotAllowed</i>   | Not logged on.                                                                                       |
| <i>OpNotSupported</i> | When called for a non-GbE board, or when this call is not supported in the running software version. |

**8.54.3.7 void DCM::DeviceControl::GetDeviceBackupTriggers ( out MM\_IDList *Triggers* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)**

Gets the list of triggers that define when a backup is needed.

When one of the Alarm-triggers is open then the "Device Operational Failure" alarm is open, which triggers the 1:1 device backup.

**Parameters**

|     |                 |                                                                                                                                                |
|-----|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| out | <i>Triggers</i> | References of alarms that trigger the backup. Currently, only alarms on mainboard can be used as triggers. This can be expanded in the future. |
|-----|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------|

**Exceptions**

|                       |                                                                                                                                                         |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | Never thrown.                                                                                                                                           |
| <i>OpNotSucceeded</i> | in case of <ul style="list-style-type: none"> <li>A timeout occurred during IIOP processing.</li> </ul>                                                 |
| <i>OpNotAllowed</i>   | Not logged on.                                                                                                                                          |
| <i>OpNotSupported</i> | in case of <ul style="list-style-type: none"> <li>not supported in the running software version.</li> <li>on any board except the mainboard.</li> </ul> |

**8.54.3.8 void DCM::DeviceControl::GetDeviceBU\_Params ( out DeviceBackupParams\_t *DeviceBackupParams* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)**

Gets the parameters used by Device Backup.

**Parameters**

|     |                            |  |
|-----|----------------------------|--|
| out | <i>DeviceBackup-Params</i> |  |
|-----|----------------------------|--|

**Exceptions**

|                       |                                                                                        |
|-----------------------|----------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing.                                             |
| <i>OpNotAllowed</i>   | Not logged on.                                                                         |
| <i>OpNotSupported</i> | When this call is not supported in the running software version.                       |
| <i>OpNotSucceeded</i> | On internal error or whether the settings cannot be expressed due to version mismatch. |

**8.54.3.9** void DCM::DeviceControl::GetDeviceBU\_ParamsV2 ( out DeviceBackupParamsV2\_t *DeviceBackupParams* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the parameters used by Device Backup.

#### Parameters

|     |                            |  |
|-----|----------------------------|--|
| out | <i>DeviceBackup-Params</i> |  |
|-----|----------------------------|--|

#### Exceptions

|                       |                                                                  |
|-----------------------|------------------------------------------------------------------|
| <i>Timeout</i>        | A timeout occurred during IIOP processing.                       |
| <i>OpNotAllowed</i>   | Not logged on.                                                   |
| <i>OpNotSupported</i> | When this call is not supported in the running software version. |
| <i>OpNotSucceeded</i> | On internal error only                                           |

**8.54.3.10** void DCM::DeviceControl::GetIP\_AliasList ( in IPS\_Ref\_t *RefPhys*, out IP\_List\_t *IP\_Addresses* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the list of IP aliases associated with a specific network interface.

#### Parameters

|    |                     |                                                                                                                                                                                                             |
|----|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>RefPhys</i>      | BoardNr and PortNr of the network interface. Board numbers 1..n refer to the I/O boards. Specify BoardNr = 0 and PortNr = 0 for the 10/100 network interface, and PortNr = 1 for the GbE network interface. |
| in | <i>IP_Addresses</i> | List of IP secondary IP addresses.                                                                                                                                                                          |

#### Exceptions

|                       |                                                                                                   |
|-----------------------|---------------------------------------------------------------------------------------------------|
| <i>Timeout</i>        | A timeout occurred during IIOP processing.                                                        |
| <i>OpNotSucceeded</i> | When RefPhys is invalid.                                                                          |
| <i>OpNotAllowed</i>   | Not logged on.                                                                                    |
| <i>OpNotSupported</i> | When called for an ASI board, or when this call is not supported in the running software version. |

**8.54.3.11** void DCM::DeviceControl::GetIP\_AliasMode ( in IPS\_Ref\_t *RefPhys*, out eActivationMode *ActivationMode* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get activation mode for the list of IP aliases associated with a specific network interface.

#### Parameters

|    |                        |                                                                                                                                                                                                             |
|----|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>RefPhys</i>         | BoardNr and PortNr of the network interface. Board numbers 1..n refer to the I/O boards. Specify BoardNr = 0 and PortNr = 0 for the 10/100 network interface, and PortNr = 1 for the GbE network interface. |
| in | <i>Activation-Mode</i> | Activation mode for the IP aliases.                                                                                                                                                                         |

**Exceptions**

|                       |                                                                                                   |
|-----------------------|---------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing.                                                        |
| <i>OpNotSucceeded</i> | When RefPhys is invalid.                                                                          |
| <i>OpNotAllowed</i>   | Not logged on.                                                                                    |
| <i>OpNotSupported</i> | When called for an ASI board, or when this call is not supported in the running software version. |

**8.54.3.12** void DCM::DeviceControl::GetPeerDeviceActiveMode ( out eDeviceActiveMode DeviceActiveMode ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the peer device mode.

**Parameters**

|     |                          |  |
|-----|--------------------------|--|
| out | <i>DeviceActive-Mode</i> |  |
|-----|--------------------------|--|

**Exceptions**

|                       |                                                                                                      |
|-----------------------|------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing.                                                           |
| <i>OpNotSucceeded</i> | On internal error only.                                                                              |
| <i>OpNotAllowed</i>   | Not logged on.                                                                                       |
| <i>OpNotSupported</i> | When called for a non-GbE board, or when this call is not supported in the running software version. |

**Version**

Release4.0

**8.54.3.13** void DCM::DeviceControl::GetPowerupDeviceActiveMode ( out eDeviceActiveMode DeviceActiveMode ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the power-up device mode.

**Parameters**

|     |                          |  |
|-----|--------------------------|--|
| out | <i>DeviceActive-Mode</i> |  |
|-----|--------------------------|--|

**Exceptions**

|                       |                                                                                                      |
|-----------------------|------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing.                                                           |
| <i>OpNotSucceeded</i> | On internal error only.                                                                              |
| <i>OpNotAllowed</i>   | Not logged on.                                                                                       |
| <i>OpNotSupported</i> | When called for a non-GbE board, or when this call is not supported in the running software version. |

**Version**

Release4.0

**8.54.3.14** void DCM::DeviceControl::GetSettingsRestoreOptions ( out RestoreOptions *options* )  
raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the restore options.

This call also returns disabled options.

#### Parameters

|     |                |                 |
|-----|----------------|-----------------|
| out | <i>options</i> | Restore options |
|-----|----------------|-----------------|

#### Exceptions

|                       |                                            |
|-----------------------|--------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing. |
| <i>OpNotSucceeded</i> | /                                          |
| <i>OpNotAllowed</i>   | Not logged on.                             |
| <i>OpNotSupported</i> | /                                          |

**Deprecated** Use GetSettingsRestoreOptions\_V2 instead

**8.54.3.15** void DCM::DeviceControl::GetSettingsRestoreOptions\_V2 ( out RestoreOptions\_V2 *options* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the restore options.

This call also returns disabled options.

#### Parameters

|     |                |                 |
|-----|----------------|-----------------|
| out | <i>options</i> | Restore options |
|-----|----------------|-----------------|

#### Exceptions

|                       |                                            |
|-----------------------|--------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing. |
| <i>OpNotSucceeded</i> | /                                          |
| <i>OpNotAllowed</i>   | Not logged on.                             |
| <i>OpNotSupported</i> | /                                          |

#### Version

8.1

**8.54.3.16** void DCM::DeviceControl::PollRestoreSettingsResult ( out eRestoreSettingsResult *Result* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Check if the asynchronously launched RestoreSettingsAsync call has finished its job (poll for its status).

#### Parameters

|     |               |                                                                                                                          |
|-----|---------------|--------------------------------------------------------------------------------------------------------------------------|
| out | <i>Result</i> | The eRestoreSettingsResult. After a reboot the state will be Done, otherwise it depends of the outcome on previous call. |
|-----|---------------|--------------------------------------------------------------------------------------------------------------------------|

**Exceptions**

|                       |                                                                                          |
|-----------------------|------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing.                                               |
| <i>OpNotSucceeded</i> | Internal errors, file format bad or the specified card is not an active IP Adapter card. |
| <i>OpNotAllowed</i>   | Not logged on.                                                                           |
| <i>OpNotSupported</i> | /                                                                                        |

**Version**

Release 8.5

**8.54.3.17** void DCM::DeviceControl::RestoreSettings ( in ByteStream *settings* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Restore settings onto the device.

**Parameters**

|    |                 |                                                                                                                           |
|----|-----------------|---------------------------------------------------------------------------------------------------------------------------|
| in | <i>settings</i> | Settings in binary format retrieved from a BackupSettings call or from a settings-export via the GUI in pre-5.0 versions. |
|----|-----------------|---------------------------------------------------------------------------------------------------------------------------|

**Exceptions**

|                       |                                            |
|-----------------------|--------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing. |
| <i>OpNotSucceeded</i> | Internal errors, file format bad.          |
| <i>OpNotAllowed</i>   | Not logged on.                             |
| <i>OpNotSupported</i> | /                                          |

**8.54.3.18** void DCM::DeviceControl::RestoreSettings2 ( in unsigned short *scope*, in ByteStream *settings* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Restore settings onto the device.

The device will be rebooted a couple of seconds after this call returned.

**Parameters**

|    |                 |                                                                                                                           |
|----|-----------------|---------------------------------------------------------------------------------------------------------------------------|
| in | <i>scope</i>    | Scope of the operation: 0-n are normal boards, 0xFFFF is whole chassis                                                    |
| in | <i>settings</i> | Settings in binary format retrieved from a BackupSettings call or from a settings-export via the GUI in pre-5.0 versions. |

**Exceptions**

|                       |                                                                                          |
|-----------------------|------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing.                                               |
| <i>OpNotSucceeded</i> | Internal errors, file format bad or the specified card is not an active IP Adapter card. |
| <i>OpNotAllowed</i>   | Not logged on.                                                                           |
| <i>OpNotSupported</i> | /                                                                                        |

**8.54.3.19** void DCM::DeviceControl::RestoreSettings3 ( in unsigned short *scope*, in ByteStream *settings*, in boolean *bReturnEarly*, out eRestoreSettingsResult *Result* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Restore settings onto the device and try to do this seamless.

This is different with RestoreSettings2 which will enforce a reboot. As the seamless apply of settings can take some time, this call will take longer than RestoreSettings2, but it avoids reboots if not necessary.

#### Parameters

|     |                     |                                                                                                                                                                                                                                                                             |
|-----|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in  | <i>scope</i>        | Scope of the operation: 0-n are normal boards, 0xFFFF is whole chassis                                                                                                                                                                                                      |
| in  | <i>settings</i>     | Settings in binary format retrieved from a BackupSettings call or from a settings-export via the GUI in pre-5.0 versions.                                                                                                                                                   |
| in  | <i>bReturnEarly</i> | when set to true, the call will return after it is determined whether a reboot is needed. On <a href="#">DCM</a> this parameter will have no effect. On D9036 the call will return before importing VSE settings, use the PollRestoreSettings-Result to monitor the result. |
| out | <i>Result</i>       | Returns the result of the restore process.                                                                                                                                                                                                                                  |

#### Exceptions

|                       |                                                                                          |
|-----------------------|------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing.                                               |
| <i>OpNotSucceeded</i> | Internal errors, file format bad or the specified card is not an active IP Adapter card. |
| <i>OpNotAllowed</i>   | Not logged on.                                                                           |
| <i>OpNotSupported</i> | /                                                                                        |

#### Version

Release 8.5

**8.54.3.20** void DCM::DeviceControl::SetCardNotOperationalTriggers ( in unsigned short *Board*, in AlarmTriggerRuleList *Rules* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set list alarm trigger rules for CardNotOperational.

#### Parameters

|    |              |                                                 |
|----|--------------|-------------------------------------------------|
| in | <i>Board</i> | Specifies BoardNr.                              |
| in | <i>Rules</i> | rules defining triggers for CardNotOperational. |

#### Exceptions

|                       |                                                                                                                                      |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | Never thrown.                                                                                                                        |
| <i>OpNotSucceeded</i> | in case of <ul style="list-style-type: none"> <li>A timeout occurred during IIOP processing.</li> <li>Invalid parameters.</li> </ul> |
| <i>OpNotAllowed</i>   | Not logged on.                                                                                                                       |
| <i>OpNotSupported</i> | Thrown if this call is not supported in the running software version.                                                                |

**8.54.3.21** void DCM::DeviceControl::SetDeviceActiveMode ( in eDeviceActiveMode *DeviceActiveMode* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the device mode.

#### Parameters

|    |                          |  |
|----|--------------------------|--|
| in | <i>DeviceActive-Mode</i> |  |
|----|--------------------------|--|

#### Exceptions

|                       |                                                                                                      |
|-----------------------|------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing.                                                           |
| <i>OpNotSucceeded</i> | When called with an invalid mode.                                                                    |
| <i>OpNotAllowed</i>   | Not logged on.                                                                                       |
| <i>OpNotSupported</i> | When called for a non-GbE board, or when this call is not supported in the running software version. |

#### Note

The device mode is a volatile setting: it is retained as long as the software keeps running, but is reset to PowerupDeviceActiveMode after a power failure or warm reboot.

**8.54.3.22** void DCM::DeviceControl::SetDeviceBackupTriggers ( in MM\_IDList *Triggers* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Sets the list of triggers that define when a backup is needed.

When one of the Alarm-triggers is open then the "Device Operational Failure" alarm is open, which triggers the 1:1 device backup.

#### Parameters

|    |                 |                                                                                                                                                |
|----|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>Triggers</i> | References of alarms that trigger the backup. Currently, only alarms on mainboard can be used as triggers. This can be expanded in the future. |
|----|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------|

#### Exceptions

|                       |                                                                                                                                                                                                           |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | Never thrown.                                                                                                                                                                                             |
| <i>OpNotSucceeded</i> | in case of <ul style="list-style-type: none"> <li>A timeout occurred during IIOP processing.</li> <li>An unknown alarm is passed. The previous alarms in the passed list are the new triggers.</li> </ul> |
| <i>OpNotAllowed</i>   | Not logged on.                                                                                                                                                                                            |
| <i>OpNotSupported</i> | in case of <ul style="list-style-type: none"> <li>not supported in the running software version.</li> <li>on any board except the mainboard.</li> </ul>                                                   |

**8.54.3.23** void DCM::DeviceControl::SetDeviceBU\_Params ( in DeviceBackupParams\_t  
DeviceBackupParams ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Sets the parameters to be used by Device Backup.

#### Parameters

|    |                     |  |
|----|---------------------|--|
| in | DeviceBackup-Params |  |
|----|---------------------|--|

#### Exceptions

|                |                                                                                                                                                                                                                                                            |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TimeOut        | A timeout occurred during IIOP processing.                                                                                                                                                                                                                 |
| OpNotAllowed   | Not logged on.                                                                                                                                                                                                                                             |
| OpNotSupported | When this call is not supported in the running software version.                                                                                                                                                                                           |
| OpNotSucceeded | When any of the following occurs: <ul style="list-style-type: none"> <li>• Peer IP Address is invalid</li> <li>• UDP Port used by another application</li> <li>• Network interface is invalid</li> <li>• Delay values are outside allowed range</li> </ul> |

**8.54.3.24** void DCM::DeviceControl::SetDeviceBU\_ParamsV2 ( in DeviceBackupParamsV2\_t  
DeviceBackupParams ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Sets the parameters to be used by Device Backup.

#### Parameters

|    |                     |  |
|----|---------------------|--|
| in | DeviceBackup-Params |  |
|----|---------------------|--|

#### Exceptions

|                |                                                                                                                                                                                                                                                                                                                                                 |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TimeOut        | A timeout occurred during IIOP processing.                                                                                                                                                                                                                                                                                                      |
| OpNotAllowed   | Not logged on.                                                                                                                                                                                                                                                                                                                                  |
| OpNotSupported | When this call is not supported in the running software version.                                                                                                                                                                                                                                                                                |
| OpNotSucceeded | When any of the following occurs: <ul style="list-style-type: none"> <li>• Peer IP Address is invalid</li> <li>• Insufficient or duplicate links</li> <li>• UDP Port used by another application</li> <li>• Network interface is invalid</li> <li>• Delay values are outside allowed range</li> <li>• Invalid role or revertive mode</li> </ul> |

**8.54.3.25** void DCM::DeviceControl::SetIP\_AliasList ( in IPS\_Ref\_t RefPhys, in IP\_List\_t  
IP\_Addresses ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the list of IP aliases associated with a specific network interface.

## Parameters

|    |                     |                                                                                                                                                                                                             |
|----|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>RefPhys</i>      | BoardNr and PortNr of the network interface. Board numbers 1..n refer to the I/O boards. Specify BoardNr = 0 and PortNr = 0 for the 10/100 network interface, and PortNr = 1 for the GbE network interface. |
| in | <i>IP_Addresses</i> | List of IP secondary IP addresses.                                                                                                                                                                          |

## Exceptions

|                       |                                                                                                                                                                                                                                                                                                   |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing.                                                                                                                                                                                                                                                        |
| <i>OpNotSucceeded</i> | When called with an invalid ActivationMode, when one of the specified aliases is outside the subnet associated with the specified network interface, when one of the specified aliases conflicts with the IP address assigned to another GbE network interface, static route or static ARP entry. |
| <i>OpNotAllowed</i>   | Not logged on.                                                                                                                                                                                                                                                                                    |
| <i>OpNotSupported</i> | When called for an ASI board, or when this call is not supported in the running software version.                                                                                                                                                                                                 |

**8.54.3.26** void DCM::DeviceControl::SetIP\_AliasMode ( in IPS\_Ref\_t *RefPhys*, in eActivationMode *ActivationMode* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set activation mode for the list of IP aliases associated with a specific network interface.

## Parameters

|    |                        |                                                                                                                                                                                                                                                                                                                                                                              |
|----|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>RefPhys</i>         | BoardNr and PortNr of the network interface. Board numbers 1..n refer to the I/O boards. Specify BoardNr = 0 and PortNr = 0 for the 10/100 network interface, and PortNr = 1 for the GbE network interface. If BoardNr = 0xffff, PortNr is ignored and the setting is applied to all boards. If PortNr = 0xffff, the setting is applied to all ports of the specified board. |
| in | <i>Activation-Mode</i> | Activation mode for the IP aliases.                                                                                                                                                                                                                                                                                                                                          |

## Exceptions

|                       |                                                                                                                                                                                                                                                                                                   |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing.                                                                                                                                                                                                                                                        |
| <i>OpNotSucceeded</i> | When called with an invalid ActivationMode, when one of the specified aliases is outside the subnet associated with the specified network interface, when one of the specified aliases conflicts with the IP address assigned to another GbE network interface, static route or static ARP entry. |
| <i>OpNotAllowed</i>   | Not logged on.                                                                                                                                                                                                                                                                                    |
| <i>OpNotSupported</i> | When called for an ASI board, or when this call is not supported in the running software version.                                                                                                                                                                                                 |

**8.54.3.27** void DCM::DeviceControl::SetPowerupDeviceActiveMode ( in eDeviceActiveMode *DeviceActiveMode* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the power-up device mode.

## Parameters

|    |                          |  |
|----|--------------------------|--|
| in | <i>DeviceActive-Mode</i> |  |
|----|--------------------------|--|

**Exceptions**

|                       |                                                                                                      |
|-----------------------|------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing.                                                           |
| <i>OpNotSucceeded</i> | When called with an invalid mode.                                                                    |
| <i>OpNotAllowed</i>   | Not logged on.                                                                                       |
| <i>OpNotSupported</i> | When called for a non-GbE board, or when this call is not supported in the running software version. |

**Note**

The power-up device mode is a non-volatile setting, which is restored to the last set value after power failure or warm reboot.

**8.54.3.28** void DCM::DeviceControl::SetSettingsRestoreOptions ( in RestoreOptions *options* )  
raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set restore options.

The options are merged into the current set of options. Unknown settings are ignored. For duplicate options only the last one is kept.

**Parameters**

|    |                |                 |
|----|----------------|-----------------|
| in | <i>options</i> | Restore options |
|----|----------------|-----------------|

**Exceptions**

|                       |                                            |
|-----------------------|--------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing. |
| <i>OpNotSucceeded</i> | /                                          |
| <i>OpNotAllowed</i>   | Not logged on.                             |
| <i>OpNotSupported</i> | /                                          |

**Deprecated** Use SetSettingsRestoreOptions\_V2

**8.54.3.29** void DCM::DeviceControl::SetSettingsRestoreOptions\_V2 ( in RestoreOptions\_V2 *options* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set restore options.

The options are merged into the current set of options. Unknown settings are ignored. For duplicate options only the last one is kept.

**Parameters**

|    |                |                 |
|----|----------------|-----------------|
| in | <i>options</i> | Restore options |
|----|----------------|-----------------|

**Exceptions**

|                       |                                            |
|-----------------------|--------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing. |
| <i>OpNotSucceeded</i> | /                                          |
| <i>OpNotAllowed</i>   | Not logged on.                             |
| <i>OpNotSupported</i> | /                                          |

## 8.55 Define and activate TS Backup

end of one\_to\_one\_backup

Collaboration diagram for Define and activate TS Backup:

### Classes

- struct [DCM::DeviceControl::TS\\_BackupParams\\_t](#)

### Functions

- void [DCM::DeviceControl::SetTS\\_BU\\_Params](#) (in [IPS\\_RefTS\\_t](#) InTS, in [TS\\_BackupParams\\_t](#) TS\_BackupParams) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Set the Backup parameters for an Input TS.*
- void [DCM::DeviceControl::GetTS\\_BU\\_Params](#) (in [IPS\\_RefTS\\_t](#) InTS, out [TS\\_BackupParams\\_t](#) T-S\_BackupParams) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get the Backup parameters for an Input TS.*
- void [DCM::DeviceControl::SetActiveInputTS](#) (in [IPS\\_RefTS\\_t](#) InTS, in [IPS\\_RefTS\\_t](#) ActiveInTS) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Let the user manually set the active InputTS.*
- void [DCM::DeviceControl::GetActiveInputTS](#) (in [IPS\\_RefTS\\_t](#) InTS, out [IPS\\_RefTS\\_t](#) ActiveInTS) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get the active InputTS.*
- void [DCM::DeviceControl::SetTS\\_BU\\_SwitchToGoodSrcOnly](#) (in unsigned short Board, in boolean Enabled) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Sets for TS backup that the switch to the backup TS will only happen if this TS is not in alarm.*
- void [DCM::DeviceControl::GetTS\\_BU\\_SwitchToGoodSrcOnly](#) (in unsigned short Board, out boolean Enabled) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Gets for TS backup if the switch to the backup TS will only happen if this TS is not in alarm.*

### 8.55.1 Detailed Description

end of one\_to\_one\_backup

### 8.55.2 Function Documentation

**8.55.2.1** void DCM::DeviceControl::GetActiveInputTS ( in IPS\_RefTS\_t *InTS*, out IPS\_RefTS\_t *ActiveInTS* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the active InputTS.

#### Parameters

|    |                   |                              |
|----|-------------------|------------------------------|
| in | <i>InTS</i>       | The main Input TS.           |
| in | <i>ActiveInTS</i> | The Input TS that is active. |

#### Exceptions

|                       |                                                                                                                                           |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | <ul style="list-style-type: none"> <li>not supported in the running software version.</li> <li>when the mainboard is supplied.</li> </ul> |
| <i>OpNotSucceeded</i> | <ul style="list-style-type: none"> <li>When a non-existing TsIn is provided.</li> <li>When a TsOut is provided iso a TsIn.</li> </ul>     |

**8.55.2.2** void DCM::DeviceControl::GetTS\_BU\_Params ( in IPS\_RefTS\_t *InTS*, out TS\_BackupParams\_t *TS\_BackupParams* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the Backup parameters for an Input TS.

#### Parameters

|     |                         |                         |
|-----|-------------------------|-------------------------|
| in  | <i>InTS</i>             | Specifies the Input TS. |
| out | <i>TS_Backup-Params</i> | The current parameters. |

#### Exceptions

|                       |                                                                                                                                                      |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | in case of <ul style="list-style-type: none"> <li>not supported in the running software version.</li> <li>when the mainboard is supplied.</li> </ul> |
| <i>OpNotSucceeded</i> | in case of <ul style="list-style-type: none"> <li>When a non-existing TsIn is provided.</li> <li>When a TsOut is provided iso a TsIn.</li> </ul>     |

**8.55.2.3** void DCM::DeviceControl::GetTS\_BU\_SwitchToGoodSrcOnly ( in unsigned short *Board*, out boolean *Enabled* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets for TS backup if the switch to the backup TS will only happen if this TS is not in alarm.

**Parameters**

|     |                |                                                                                  |
|-----|----------------|----------------------------------------------------------------------------------|
| in  | <i>Board</i>   |                                                                                  |
| out | <i>Enabled</i> | TRUE if the switch to the backup TS will only happen if this TS is not in alarm. |

**Exceptions**

|                       |                              |
|-----------------------|------------------------------|
| <i>OpNotSupported</i> | when Board = 0 = Main board. |
| <i>OpNotSucceeded</i> | if Board is invalid          |

**8.55.2.4 void DCM::DeviceControl::SetActiveInputTS ( in IPS\_RefTS\_t *InTS*, in IPS\_RefTS\_t *ActiveInTS* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)**

Let the user manually set the active InputTS.

**Parameters**

|    |                   |                                     |
|----|-------------------|-------------------------------------|
| in | <i>InTS</i>       | The main Input TS.                  |
| in | <i>ActiveInTS</i> | The Input TS that should be active. |

**Exceptions**

|                       |                                                                                                                                                                                                         |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | <ul style="list-style-type: none"> <li>not supported in the running software version.</li> <li>when the mainboard is supplied.</li> </ul>                                                               |
| <i>OpNotSucceeded</i> | <ul style="list-style-type: none"> <li>When a non-existing TsIn is provided.</li> <li>When a TsOut is provided iso a TsIn.</li> <li>When the ActiveInTS is currently not in the backup list.</li> </ul> |

**8.55.2.5 void DCM::DeviceControl::SetTS\_BU\_Params ( in IPS\_RefTS\_t *InTS*, in TS\_BackupParams\_t *TS\_BackupParams* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)**

Set the Backup parameters for an Input TS.

**Parameters**

|    |                         |                          |
|----|-------------------------|--------------------------|
| in | <i>InTS</i>             | Specifies the Input TS.  |
| in | <i>TS_Backup-Params</i> | The parameters to apply. |

**Exceptions**

|                       |                                                                                                                                                      |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | in case of <ul style="list-style-type: none"> <li>not supported in the running software version.</li> <li>when the mainboard is supplied.</li> </ul> |

|                       |                                                                                                                                                                                                                                                                                     |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | in case of <ul style="list-style-type: none"> <li>• When a non-existing TsIn is provided.</li> <li>• When a TsOut is provided instead of a TsIn.</li> <li>• There is more than one backup source specified.</li> <li>• The Backup source is the same as the target TsIn.</li> </ul> |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**8.55.2.6** void DCM::DeviceControl::SetTS\_BU\_SwitchToGoodSrcOnly ( in unsigned short *Board*, in boolean *Enabled* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Sets for TS backup that the switch to the backup TS will only happen if this TS is not in alarm.

#### Parameters

|    |                |                                                                                  |
|----|----------------|----------------------------------------------------------------------------------|
| in | <i>Board</i>   |                                                                                  |
| in | <i>Enabled</i> | TRUE if the switch to the backup TS will only happen if this TS is not in alarm. |

#### Exceptions

|                       |                              |
|-----------------------|------------------------------|
| <i>OpNotSupported</i> | when Board = 0 = Main board. |
| <i>OpNotSucceeded</i> | if Board is invalid          |

## 8.56 MIP Synchronization feature

Collaboration diagram for MIP Synchronization feature:

### Classes

- struct [DCM::DeviceControl::MIP\\_SyncTargetSettings\\_t](#)

### Enumerations

- enum [DCM::DeviceControl::enMIP\\_Sync\\_DeviceRole](#) { [DCM::DeviceControl::eMIP\\_SyncNone](#), - [DCM::DeviceControl::eMIP\\_SyncInitiator](#), [DCM::DeviceControl::eMIP\\_SyncTarget](#) }

### Functions

- void [DCM::DeviceControl::GetMIP\\_SyncDeviceRole](#) (out [enMIP\\_Sync\\_DeviceRole](#) [MIP\\_Sync\\_DeviceRole](#)) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get the MIP Synchronization role of a device.*
- void [DCM::DeviceControl::SetMIP\\_SyncDeviceRole](#) (in [enMIP\\_Sync\\_DeviceRole](#) [MIP\\_Sync\\_DeviceRole](#)) raises (TimeOut, OperationFailed, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Set the MIP Synchronization role of a device.*
- void [DCM::DeviceControl::GetMIP\\_SyncTargetSettings](#) (out [MIP\\_SyncTargetSettings\\_t](#) [TargetSettings](#)) raises (TimeOut, OperationFailed, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get the settings of the MIP Synchronization Target.*
- void [DCM::DeviceControl::SetMIP\\_SyncTargetSettings](#) (in [MIP\\_SyncTargetSettings\\_t](#) [TargetSettings](#)) raises (TimeOut, OperationFailed, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Set the settings of the MIP Synchronization Target.*
- void [DCM::DeviceControl::ASI\\_SFN\\_MKII\\_GetMIP\\_SyncEnable](#) (in unsigned short [BoardNr](#), out boolean [MIP\\_SyncEnabled](#)) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get the MIP Synchronization Enabled setting of an ASI SFN MKII Board.*
- void [DCM::DeviceControl::ASI\\_SFN\\_MKII\\_SetMIP\\_SyncEnable](#) (in unsigned short [BoardNr](#), in boolean [MIP\\_SyncEnabled](#)) raises (TimeOut, OperationFailed, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Set the MIP Synchronization Enabled setting of an ASI SFN MKII Board.*

## 8.56.1 Enumeration Type Documentation

## 8.56.1.1 enum DCM::DeviceControl::enMIP\_Sync\_DeviceRole

Enumerator:

*eMIP\_SyncNone*  
*eMIP\_SyncInitiator*  
*eMIP\_SyncTarget*

Definition at line 21847 of file DCM.idl.

## 8.56.2 Function Documentation

8.56.2.1 void DCM::DeviceControl::ASI\_SF\_N\_MKII\_GetMIP\_SyncEnable ( in unsigned short *BoardNr*, out boolean *MIP\_SyncEnabled* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the MIP Synchronization Enabled setting of an ASI SFN MKII Board.

## Parameters

|     |                         |                                              |
|-----|-------------------------|----------------------------------------------|
| in  | <i>BoardNr</i>          |                                              |
| out | <i>MIP_Sync-Enabled</i> | Indicates whether MIP Sync is enabled or not |

## Exceptions

|                        |                                                                |
|------------------------|----------------------------------------------------------------|
| <i>TimeOut</i>         | A timeout occurred during IIOP processing.                     |
| <i>OpNotAllowed</i>    | Not logged on.                                                 |
| <i>OpNotSupported</i>  | When called for non-ASI-SFN-MKII boards.                       |
| <i>OpNotSucceeded</i>  | On internal error only.                                        |
| <i>OperationFailed</i> | When <a href="#">DCM</a> is not MIP Synchronization Initiator. |

## Version

Release 9.0

8.56.2.2 void DCM::DeviceControl::ASI\_SF\_N\_MKII\_SetMIP\_SyncEnable ( in unsigned short *BoardNr*, in boolean *MIP\_SyncEnable* ) raises (TimeOut, OperationFailed, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the MIP Synchronization Enabled setting of an ASI SFN MKII Board.

## Parameters

|    |                        |                                                     |
|----|------------------------|-----------------------------------------------------|
| in | <i>BoardNr</i>         |                                                     |
| in | <i>MIP_Sync-Enable</i> | Indicates whether MIP Sync should be enabled or not |

**Exceptions**

|                        |                                                       |
|------------------------|-------------------------------------------------------|
| <i>TimeOut</i>         | A timeout occurred during IIOP processing.            |
| <i>OpNotAllowed</i>    | Not logged on.                                        |
| <i>OpNotSupported</i>  | When called for non-ASI-SFN-MKII boards.              |
| <i>OpNotSucceeded</i>  | On internal error only.                               |
| <i>OperationFailed</i> | When <b>DCM</b> is not MIP Synchronization Initiator. |

**Version**

Release 9.0

**8.56.2.3** void DCM::DeviceControl::GetMIP\_SyncDeviceRole ( out enMIP\_Sync\_DeviceRole MIP\_Sync\_DeviceRole ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the MIP Synchronization role of a device.

**Parameters**

|     |                            |                                                     |
|-----|----------------------------|-----------------------------------------------------|
| out | <i>MIP_Sync_DeviceRole</i> | indicates device role regarding MIP Synchronization |
|-----|----------------------------|-----------------------------------------------------|

**Exceptions**

|                       |                                                                  |
|-----------------------|------------------------------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing.                       |
| <i>OpNotAllowed</i>   | Not logged on.                                                   |
| <i>OpNotSupported</i> | When this call is not supported in the running software version. |
| <i>OpNotSucceeded</i> | On internal error only.                                          |

**Version**

Release 9.0

**8.56.2.4** void DCM::DeviceControl::GetMIP\_SyncTargetSettings ( out MIP\_SyncTargetSettings\_t TargetSettings ) raises (TimeOut, OperationFailed, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the settings of the MIP Synchronization Target.

**Parameters**

|     |                       |                                            |
|-----|-----------------------|--------------------------------------------|
| out | <i>TargetSettings</i> | settings of the MIP Synchronization Target |
|-----|-----------------------|--------------------------------------------|

**Exceptions**

|                        |                                                                  |
|------------------------|------------------------------------------------------------------|
| <i>TimeOut</i>         | A timeout occurred during IIOP processing.                       |
| <i>OpNotAllowed</i>    | Not logged on.                                                   |
| <i>OpNotSupported</i>  | When this call is not supported in the running software version. |
| <i>OpNotSucceeded</i>  | On internal error only.                                          |
| <i>OperationFailed</i> | When <b>DCM</b> is not MIP Synchronization Initiator.            |

**Version**

Release 9.0

**8.56.2.5** void DCM::DeviceControl::SetMIP\_SyncDeviceRole ( in enMIP\_Sync\_DeviceRole MIP\_Sync\_DeviceRole ) raises (TimeOut, OperationFailed, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the MIP Synchronization role of a device.

**Parameters**

|    |                            |                                                     |
|----|----------------------------|-----------------------------------------------------|
| in | <i>MIP_Sync_DeviceRole</i> | indicates device role regarding MIP Synchronization |
|----|----------------------------|-----------------------------------------------------|

**Exceptions**

|                        |                                                                  |
|------------------------|------------------------------------------------------------------|
| <i>TimeOut</i>         | A timeout occurred during IIOP processing.                       |
| <i>OpNotAllowed</i>    | Not logged on.                                                   |
| <i>OpNotSupported</i>  | When this call is not supported in the running software version. |
| <i>OpNotSucceeded</i>  | On internal error only.                                          |
| <i>OperationFailed</i> | When problems regarding settingsfile.                            |

**Version**

Release 9.0

**8.56.2.6** void DCM::DeviceControl::SetMIP\_SyncTargetSettings ( in MIP\_SyncTargetSettings\_t TargetSettings ) raises (TimeOut, OperationFailed, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the settings of the MIP Synchronization Target.

**Parameters**

|     |                       |                                         |
|-----|-----------------------|-----------------------------------------|
| out | <i>TargetSettings</i> | settings of the Target MIP Synchronizer |
|-----|-----------------------|-----------------------------------------|

**Exceptions**

|                        |                                                                                                        |
|------------------------|--------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>         | A timeout occurred during IIOP processing.                                                             |
| <i>OpNotAllowed</i>    | Not logged on.                                                                                         |
| <i>OpNotSupported</i>  | When this call is not supported in the running software version.                                       |
| <i>OpNotSucceeded</i>  | On internal error only.                                                                                |
| <i>OperationFailed</i> | When <a href="#">DCM</a> is not MIP Synchronization Initiator or when problems regarding settingsfile. |

**Version**

Release 9.0

## 8.57 DTF

Types and methods to control DTF.

### Classes

- struct [DCM::DeviceControl::ASI\\_DTF\\_t](#)  
*Structure holding DTF input settings.*
- struct [DCM::DeviceControl::ASI\\_DTF\\_Ex\\_t](#)  
*Structure holding DTF input settings. The difference with the [ASI\\_DTF\\_t](#) structure is that this structure here doesn't hold the scrambling key directly. Instead, it holds a reference to a key in the list that can be set up using the [ASI\\_DTF\\_SetKeyList](#) method. Also the scrambling type can be selected to be odd or even.*
- struct [DCM::DeviceControl::ASI\\_DTF\\_RDCS\\_t](#)  
*Structure holding DTF RDCS input settings. From V9.0 onwards.*
- struct [DCM::DeviceControl::ASI\\_DTF\\_OutputTS\\_t](#)  
*Structure holding DTF output settings.*
- struct [DCM::DeviceControl::ASI\\_DTF\\_OutputTS\\_Ex\\_t](#)  
*Structure holding DTF output settings. The difference with the [ASI\\_DTF\\_OutputTS\\_t](#) is that this structure here provides for scrambling type, scrambling key indices and the possibility to overrule the input-level settings by one global setting.*
- struct [DCM::DeviceControl::ASI\\_DTF\\_OutputTS\\_RDCS\\_t](#)  
*Structure holding DTF RDCS output settings. From V9.0 onwards.*
- struct [DCM::DeviceControl::ASI\\_DTF\\_ScramblingKeyPair\\_t](#)  
*Structure holding DTF scrambling keys.*
- struct [DCM::DeviceControl::ASI\\_DTF\\_ScramblingKey\\_t](#)

### Typedefs

- typedef sequence< [ASI\\_DTF\\_t](#) > [DCM::DeviceControl::ASI\\_DTF\\_List\\_t](#)  
*Provides a list of DTF input settings structures.*
- typedef sequence< [ASI\\_DTF\\_Ex\\_t](#) > [DCM::DeviceControl::ASI\\_DTF\\_ListEx\\_t](#)  
*Provides a list of DTF input settings structures.*
- typedef sequence< [ASI\\_DTF\\_RDCS\\_t](#) > [DCM::DeviceControl::ASI\\_DTF\\_RDCS\\_List\\_t](#)  
*Provides a list of DTF RDCS input settings structures. From V9.0 onwards.*
- typedef sequence< [ASI\\_DTF\\_ScramblingKeyPair\\_t](#) > [DCM::DeviceControl::ASI\\_DTF\\_ScramblingKeyList](#)  
*Type to hold a list of scrambling key pairs, should hold exactly 64 key pairs.*
- typedef sequence< [ASI\\_DTF\\_ScramblingKey\\_t](#) > [DCM::DeviceControl::ASI\\_DTF\\_KeyList\\_t](#)

### Enumerations

- enum [DCM::DeviceControl::eASI\\_BoardType](#) { [DCM::DeviceControl::ASI\\_BoardRegular](#), [DCM::DeviceControl::ASI\\_BoardDTF](#) }  
*Defines the ASI board's sub type.*
- enum [DCM::DeviceControl::eASI\\_DTF\\_ScramblingType](#) { [DCM::DeviceControl::DTF\\_OddScrambling](#), [DCM::DeviceControl::DTF\\_EvenScrambling](#) }  
*Defines the scrambling type.*

## Functions

- void [DCM::DeviceControl::SetASIBoardType](#) (in IPS\_Ref\_t RefPhys, in eASI\_BoardType ASIBoardType) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Configures the ASI board in either regular or DTF mode.*
- void [DCM::DeviceControl::GetASIBoardType](#) (in IPS\_Ref\_t RefPhys, out eASI\_BoardType ASIBoardType) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Reads the current ASI board sub-type.*
- ASI\_DTF\_OutputTS\_t [DCM::DeviceControl::ASI\\_DTF\\_OutTS\\_Get](#) (in IPS\_Ref\_t RefPhys) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Retrieves the current DTF settings.*
- ASI\_DTF\_OutputTS\_Ex\_t [DCM::DeviceControl::ASI\\_DTF\\_OutTS\\_GetEx](#) (in IPS\_Ref\_t RefPhys) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Retrieves the current DTF settings.*
- ASI\_DTF\_OutputTS\_RDCS\_t [DCM::DeviceControl::ASI\\_DTF\\_OutTS\\_RDCS\\_Get](#) (in IPS\_Ref\_t RefPhys) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Retrieves the DTF RDCS settings.*
- void [DCM::DeviceControl::ASI\\_DTF\\_Change](#) (in IPS\_Ref\_t RefPhys, in ASI\_DTF\_OutputTS\_t - OutputTS) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Sets the DTF settings.*
- void [DCM::DeviceControl::ASI\\_DTF\\_ChangeEx](#) (in IPS\_Ref\_t RefPhys, in ASI\_DTF\_OutputTS\_Ex\_t OutputTS) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Sets the DTF settings.*
- void [DCM::DeviceControl::ASI\\_DTF\\_RDCS\\_Change](#) (in IPS\_Ref\_t RefPhys, in ASI\_DTF\_OutputTS\_RDCS\_t OutputTS) raises (TimeOut, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)  
*Sets DTF RDCS settings.*
- unsigned long [DCM::DeviceControl::ASI\\_DTF\\_OutTS\\_GetStuffingBitRate](#) (in IPS\_Ref\_t RefPhys) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Retrieves the bit rate of the stuffing packets in the DTF output stream.*
- ASI\_DTF\_ScramblingKeyList [DCM::DeviceControl::ASI\\_DTF\\_GetKeyList](#) (in IPS\_Ref\_t RefPhys) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Retrieves the list of 64 scrambling key pairs.*
- void [DCM::DeviceControl::ASI\\_DTF\\_SetKeyList](#) (in IPS\_Ref\_t RefPhys, in ASI\_DTF\_ScramblingKeyList KeyList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Sets up the list with 64 scrambling key pairs.*
- void [DCM::DeviceControl::ASI\\_DTF\\_SetKeyList\\_V2](#) (in unsigned short BoardNumber, in ASI\_DTF\_KeyList\_t KeyList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Replace DTF BISS scrambling keys.*
- void [DCM::DeviceControl::ASI\\_DTF\\_ClearCredentials](#) (in unsigned short BoardNumber) raises (-TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Clear all DTF related credentials.*
- void [DCM::DeviceControl::ASI\\_DTF\\_SetSWDK](#) (in unsigned short BoardNumber, in string SWDK) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Enter a SWDF decryption key.*

### 8.57.1 Detailed Description

Types and methods to control DTF.

### 8.57.2 Typedef Documentation

#### 8.57.2.1 typedef sequence< ASI\_DTF\_ScramblingKey\_t> DCM::DeviceControl::ASI\_DTF\_KeyList\_t

Definition at line 22084 of file DCM.idl.

#### 8.57.2.2 typedef sequence<ASI\_DTF\_t> DCM::DeviceControl::ASI\_DTF\_List\_t

Provides a list of DTF input settings structures.

**Deprecated** Obsoleted by ASI\_DTF\_ListEx\_t from release 6.0

Definition at line 22022 of file DCM.idl.

#### 8.57.2.3 typedef sequence<ASI\_DTF\_Ex\_t> DCM::DeviceControl::ASI\_DTF\_ListEx\_t

Provides a list of DTF input settings structures.

Definition at line 22025 of file DCM.idl.

#### 8.57.2.4 typedef sequence<ASI\_DTF\_RDCS\_t> DCM::DeviceControl::ASI\_DTF\_RDCS\_List\_t

Provides a list of DTF RDCS input settings structures. From V9.0 onwards.

Definition at line 22028 of file DCM.idl.

#### 8.57.2.5 typedef sequence<ASI\_DTF\_ScramblingKeyPair\_t> DCM::DeviceControl::ASI\_DTF\_ScramblingKeyList

Type to hold a list of scrambling key pairs, should hold exactly 64 key pairs.

**Deprecated** Obsoleted in release 6.0

Definition at line 22073 of file DCM.idl.

### 8.57.3 Enumeration Type Documentation

#### 8.57.3.1 enum DCM::DeviceControl::eASI\_BoardType

Defines the ASI board's sub type.

Enumerator:

**ASI\_BoardRegular** Generic ASI mode.

**ASI\_BoardDTF** DTF mode.

Definition at line 21966 of file DCM.idl.

#### 8.57.3.2 enum DCM::DeviceControl::eASI\_DTF\_ScramblingType

Defines the scrambling type.

Enumerator:

**DTF\_OddScrambling** Odd scrambling.

***DTF\_EvenScrambling*** Even scrambling.

Definition at line 21973 of file DCM.idl.

#### 8.57.4 Function Documentation

**8.57.4.1** void DCM::DeviceControl::ASI\_DTF\_Change ( in IPS\_Ref\_t *RefPhys*, in ASI\_DTF\_OutputTS\_t *OutputTS* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Sets the DTF settings.

##### Parameters

|    |                 |                                                                                           |
|----|-----------------|-------------------------------------------------------------------------------------------|
| in | <i>RefPhys</i>  | The board (and port) to apply the call on. Only port 10 (index 9) is currently supported. |
| in | <i>OutputTS</i> | The new DTF configuration                                                                 |

**Deprecated** Obsoleted in release 6.0

**8.57.4.2** void DCM::DeviceControl::ASI\_DTF\_ChangeEx ( in IPS\_Ref\_t *RefPhys*, in ASI\_DTF\_OutputTS\_Ex\_t *OutputTS* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Sets the DTF settings.

##### Parameters

|    |                 |                                                                                           |
|----|-----------------|-------------------------------------------------------------------------------------------|
| in | <i>RefPhys</i>  | The board (and port) to apply the call on. Only port 10 (index 9) is currently supported. |
| in | <i>OutputTS</i> | The new DTF configuration                                                                 |

**8.57.4.3** void DCM::DeviceControl::ASI\_DTF\_ClearCredentials ( in unsigned short *BoardNumber* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Clear all DTF related credentials.

##### Parameters

|    |                    |                                                            |
|----|--------------------|------------------------------------------------------------|
| in | <i>BoardNumber</i> | The board to apply the call on. Only board 0 is supported. |
|----|--------------------|------------------------------------------------------------|

##### Version

8.5

**8.57.4.4** ASI\_DTF\_ScramblingKeyList DCM::DeviceControl::ASI\_DTF\_GetKeyList ( in IPS\_Ref\_t *RefPhys* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Retrieves the list of 64 scrambling key pairs.

**Parameters**

|           |                |                                                                                           |
|-----------|----------------|-------------------------------------------------------------------------------------------|
| <i>in</i> | <i>RefPhys</i> | The board (and port) to apply the call on. Only port 10 (index 9) is currently supported. |
|-----------|----------------|-------------------------------------------------------------------------------------------|

**Returns**

A list holding the key pairs.

**Deprecated** Obsoleted in release 6.0

**8.57.4.5** `ASI_DTF_OutputTS_t DCM::DeviceControl::ASI_DTF_OutTS_Get ( in IPS_Ref_t RefPhys )`  
raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Retrieves the current DTF settings.

**Parameters**

|           |                |                                                                                           |
|-----------|----------------|-------------------------------------------------------------------------------------------|
| <i>in</i> | <i>RefPhys</i> | The board (and port) to apply the call on. Only port 10 (index 9) is currently supported. |
|-----------|----------------|-------------------------------------------------------------------------------------------|

**Returns**

The current DTF configuration.

**Deprecated** Obsoleted in release 6.0

**8.57.4.6** `ASI_DTF_OutputTS_Ex_t DCM::DeviceControl::ASI_DTF_OutTS_GetEx ( in IPS_Ref_t RefPhys )`  
raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Retrieves the current DTF settings.

**Parameters**

|           |                |                                                                                           |
|-----------|----------------|-------------------------------------------------------------------------------------------|
| <i>in</i> | <i>RefPhys</i> | The board (and port) to apply the call on. Only port 10 (index 9) is currently supported. |
|-----------|----------------|-------------------------------------------------------------------------------------------|

**Returns**

The current DTF configuration.

**8.57.4.7** `unsigned long DCM::DeviceControl::ASI_DTF_OutTS_GetStuffingBitRate ( in IPS_Ref_t RefPhys )`  
raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Retrieves the bit rate of the stuffing packets in the DTF output stream.

**Parameters**

|           |                |                                                                                           |
|-----------|----------------|-------------------------------------------------------------------------------------------|
| <i>in</i> | <i>RefPhys</i> | The board (and port) to apply the call on. Only port 10 (index 9) is currently supported. |
|-----------|----------------|-------------------------------------------------------------------------------------------|

**Returns**

The bit rate of the stuffing packets

**8.57.4.8** `ASI_DTF_OutputTS_RDCS_t DCM::DeviceControl::ASI_DTF_OutTS_RDCS_Get ( in IPS_Ref_t RefPhys )` raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Retrieves the DTF RDCS settings.

**Parameters**

|    |                |                                                                                           |
|----|----------------|-------------------------------------------------------------------------------------------|
| in | <i>RefPhys</i> | The board (and port) to apply the call on. Only port 10 (index 9) is currently supported. |
|----|----------------|-------------------------------------------------------------------------------------------|

**Returns**

The DTF RDCS settings.

**Version**

Release 9.0

**8.57.4.9** `void DCM::DeviceControl::ASI_DTF_RDCS_Change ( in IPS_Ref_t RefPhys, in ASI_DTF_OutputTS_RDCS_t OutputTS )` raises (TimeOut, OpNotSucceeded, OperationFailed, OpNotAllowed, OpNotSupported)

Sets DTF RDCS settings.

**Parameters**

|    |                 |                                                                                           |
|----|-----------------|-------------------------------------------------------------------------------------------|
| in | <i>RefPhys</i>  | The board (and port) to apply the call on. Only port 10 (index 9) is currently supported. |
| in | <i>OutputTS</i> | The DTF RDCS settings of each input                                                       |

**Version**

Release 9.0

**8.57.4.10** `void DCM::DeviceControl::ASI_DTF_SetKeyList ( in IPS_Ref_t RefPhys, in ASI_DTF_ScramblingKeyList KeyList )` raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Sets up the list with 64 scrambling key pairs.

**Parameters**

|    |                |                                                                                           |
|----|----------------|-------------------------------------------------------------------------------------------|
| in | <i>RefPhys</i> | The board (and port) to apply the call on. Only port 10 (index 9) is currently supported. |
| in | <i>KeyList</i> | A list holding exactly 64 key pairs.                                                      |

**Deprecated** Obsoleted in release 6.0

**8.57.4.11** void DCM::DeviceControl::ASI\_DTF\_SetKeyList\_V2 ( in unsigned short *BoardNumber*, in ASI\_DTF\_KeyList\_t *KeyList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Replace DTF BISS scrambling keys.

If an index is used multiple times in the list of key pairs, only the last keypair will be applied. If a key is not valid, it will erase the key that is currently in use.

#### Parameters

|    |                    |                                                            |
|----|--------------------|------------------------------------------------------------|
| in | <i>BoardNumber</i> | The board to apply the call on. Only board 0 is supported. |
| in | <i>KeyList</i>     | List of keys to fill out.                                  |

#### Version

8.5

**8.57.4.12** void DCM::DeviceControl::ASI\_DTF\_SetSWDK ( in unsigned short *BoardNumber*, in string *SWDK* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Enter a SWDF decryption key.

#### Parameters

|    |                    |                                                             |
|----|--------------------|-------------------------------------------------------------|
| in | <i>BoardNumber</i> | The board to apply the call on. Only board 0 is supported.  |
| in | <i>SWDK</i>        | The hex encoded decryption key, exactly 48 characters long. |

#### Version

8.5

**8.57.4.13** void DCM::DeviceControl::GetASIBoardType ( in IPS\_Ref\_t *RefPhys*, out eASI\_BoardType *ASIBoardType* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Reads the current ASI board sub-type.

#### Parameters

|     |                     |                                                                                                                       |
|-----|---------------------|-----------------------------------------------------------------------------------------------------------------------|
| in  | <i>RefPhys</i>      | The board (and port) to apply the call on. Only port 10 (index 9) and wildcard port (0xFFFF) are currently supported. |
| out | <i>ASIBoardType</i> | The board's sub-type                                                                                                  |

**8.57.4.14** void DCM::DeviceControl::SetASIBoardType ( in IPS\_Ref\_t *RefPhys*, in eASI\_BoardType *ASIBoardType* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Configures the ASI board in either regular or DTF mode.

#### Parameters

|    |                |                                                                                                                       |
|----|----------------|-----------------------------------------------------------------------------------------------------------------------|
| in | <i>RefPhys</i> | The board (and port) to apply the call on. Only port 10 (index 9) and wildcard port (0xFFFF) are currently supported. |
|----|----------------|-----------------------------------------------------------------------------------------------------------------------|

---

|    |                     |                      |
|----|---------------------|----------------------|
| in | <i>ASIBoardType</i> | The board's sub-type |
|----|---------------------|----------------------|

## 8.58 Measurements and alarms

This module groups measurements types, enums and methods as well as alarms related things.

### Classes

- struct [DCM::DeviceControl::MM\\_MessageMainPart](#)  
*Structure to pass Messages from the device to whatever client.*
- struct [DCM::DeviceControl::MM\\_Message](#)
- struct [DCM::DeviceControl::MessageBufferInfo](#)
- struct [DCM::DeviceControl::MessageSetting](#)  
*Message settings.*
- struct [DCM::DeviceControl::MM\\_MessageTypeSetting](#)  
*Message type settings.*
- struct [DCM::DeviceControl::MM\\_MessageSetting](#)  
*Measurement message settings.*
- struct [DCM::DeviceControl::MM\\_Measurement](#)
- struct [DCM::DeviceControl::MM\\_TypeInfo](#)
- struct [DCM::DeviceControl::MM\\_TypeInfo\\_V2](#)  
*V2 of [MM\\_TypeInfo](#): BackupTriggerMethod is added.*
- struct [DCM::DeviceControl::MM\\_MeasurementStat](#)
- struct [DCM::DeviceControl::BoardBitrateThreshold](#)  
*The bitrate threshold for video, audio and data service losses (board specific).*
- struct [DCM::DeviceControl::MM\\_MessageTypeErrorInterval](#)
- struct [DCM::DeviceControl::CofTrigger\\_t](#)  
*Structure used in the configuration of the triggers for card not operational failure alarms.*

### Typedefs

- typedef sequence< MM\_Message > [DCM::DeviceControl::MM\\_MessageList](#)  
*A sequence of [MM\\_Message](#).*
- typedef sequence < MM\_MessageTypeSetting > [DCM::DeviceControl::MM\\_MessageTypeSetting-List](#)  
*A sequence of [MM\\_MessageTypeSetting](#).*
- typedef sequence < MM\_MessageSetting > [DCM::DeviceControl::MM\\_MessageSettingList](#)  
*A sequence of [MM\\_MessageSetting](#).*
- typedef sequence< MM\_Measurement > [DCM::DeviceControl::MM\\_MeasurementList](#)  
*A sequence of [MM\\_Measurement](#).*
- typedef sequence< MM\_TypeInfo > [DCM::DeviceControl::MM\\_TypeInfoList](#)  
*A sequence of [MM\\_TypeInfo](#).*
- typedef sequence< MM\_TypeInfo\_V2 > [DCM::DeviceControl::MM\\_TypeInfoList\\_V2](#)  
*A sequence of [MM\\_TypeInfo\\_V2](#).*
- typedef sequence < MM\_MeasurementStat > [DCM::DeviceControl::MM\\_MeasurementStatList](#)  
*A sequence of [MM\\_MeasurementStat](#).*
- typedef sequence < MM\_MessageTypeErrorInterval > [DCM::DeviceControl::MM\\_MessageType-ErrorIntervalList](#)
- typedef sequence< CofTrigger\_t > [DCM::DeviceControl::CofTriggerList\\_t](#)  
*List of card not operational failure alarm triggers.*

## Enumerations

- enum `DCM::DeviceControl::MeasureType` { `DCM::DeviceControl::Binary`, `DCM::DeviceControl::Analog` }
- enum `DCM::DeviceControl::MeasureValidity` { `DCM::DeviceControl::MeasValidity_NotValid`, `DCM::DeviceControl::MeasValidity_NotDefined`, `DCM::DeviceControl::MeasValidity_Defined` }
- enum `DCM::DeviceControl::MM_ID_Category` { `DCM::DeviceControl::MM_ID_CatAll`, `DCM::DeviceControl::MM_ID_CatOther`, `DCM::DeviceControl::MM_ID_CatInput`, `DCM::DeviceControl::MM_ID_CatOutput` }

*Rosa Like message categories.*

- enum `DCM::DeviceControl::MsgSeverity` { `DCM::DeviceControl::Indeterminate`, `DCM::DeviceControl::Critical`, `DCM::DeviceControl::Major`, `DCM::DeviceControl::Minor`, `DCM::DeviceControl::Warning`, `DCM::DeviceControl::Cleared`, `DCM::DeviceControl::Information` }

*Rosa like message severity indicators.*

- enum `DCM::DeviceControl::MsgStatus` { `DCM::DeviceControl::Open`, `DCM::DeviceControl::Closed`, `DCM::DeviceControl::OpenMinorUpper`, `DCM::DeviceControl::OpenMinorLower`, `DCM::DeviceControl::OpenMajorUpper`, `DCM::DeviceControl::OpenMajorLower`, `DCM::DeviceControl::ClosedMinorUpper`, `DCM::DeviceControl::ClosedMinorLower`, `DCM::DeviceControl::ClosedMajorUpper`, `DCM::DeviceControl::ClosedMajorLower`, `DCM::DeviceControl::NotDefined`, `DCM::DeviceControl::NotValid` }

*Rosa like message status indicators.*

- enum `DCM::DeviceControl::MsgBehaviour` { `DCM::DeviceControl::NotPending`, `DCM::DeviceControl::ClearedByUser`, `DCM::DeviceControl::ClearedBySystem` }

*Rosa like message behaviour indicators.*

- enum `DCM::DeviceControl::MsgClass` { `DCM::DeviceControl::Communication`, `DCM::DeviceControl::Quality`, `DCM::DeviceControl::Processing`, `DCM::DeviceControl::Equipment`, `DCM::DeviceControl::Environmental` }

*Rosa like message classes.*

- enum `DCM::DeviceControl::MM_MeasureStatus` { `DCM::DeviceControl::AlarmBegin`, `DCM::DeviceControl::AlarmEnd` }
- enum `DCM::DeviceControl::DeviceLevel` { `DCM::DeviceControl::DL_DeviceLevel`, `DCM::DeviceControl::DL_BoardLevel`, `DCM::DeviceControl::DL_PortLevel`, `DCM::DeviceControl::DL_TSLevel`, `DCM::DeviceControl::DL_ServiceLevel`, `DCM::DeviceControl::DL_ComponentLevel` }
- enum `DCM::DeviceControl::eMessage` { `DCM::DeviceControl::ePAT`, `DCM::DeviceControl::ePMT`, `DCM::DeviceControl::eAudioVideoPid`, `DCM::DeviceControl::eDataPid` }
- enum `DCM::DeviceControl::eBoardPresenceTrigger_t` { `DCM::DeviceControl::ePresent`, `DCM::DeviceControl::eAlways` }

*Defines the triggers for raising a card not operational failure alarm.*

## Functions

- `MM_MessageList` `DCM::DeviceControl::MM_GetMessageList` (in unsigned long StartMsgNbr, in unsigned long EndMsgNbr) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Used to get the a sequence of messages from the device.*

- `MessageBufferInfo` `DCM::DeviceControl::GetMessageBufferInfo` () raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Gets the current status of the MsgBuffer.*

- void `DCM::DeviceControl::GenerateTestMsg` () raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*causes a test message to be sent.*

- void [DCM::DeviceControl::UpdatePendingTestAlarm](#) (in unsigned short Board, in octet Action, in string Detail) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*update a test alarm via user input.*

- void [DCM::DeviceControl::MM\\_GetAllOpenMsgStatus](#) (out unsigned short OldestSeqNumber, out unsigned short LatestSeqNumber, out MM\_Message OldestMessage, out MM\_Message LatestMessage, out MM\_MessageList OpenMessageList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Gets all messages with open status plus current message buffer info.*

- void [DCM::DeviceControl::MM\\_SetMsgTypeSettingL](#) (in IPS\_Ref\_t RefPhys, in MM\_MessageTypeSettingList List) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Set settings per message-type.*

- void [DCM::DeviceControl::MM\\_GetMsgTypeSettingL](#) (in IPS\_Ref\_t RefPhys, out MM\_MessageTypeSettingList List) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get settings per message-type.*

- void [DCM::DeviceControl::MM\\_SetMsgSettingL](#) (in MM\_MessageSettingList List) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Set settings per message.*

- void [DCM::DeviceControl::MM\\_GetMsgSettingL](#) (out MM\_MessageSettingList List) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get settings per message.*

- void [DCM::DeviceControl::SetAllMsgEnabled](#) (in octet AllMsgEnabled) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Specify whether all messages are enabled.*

- void [DCM::DeviceControl::GetAllMsgEnabled](#) (out octet AllMsgEnabled) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get Specification whether all messages are enabled.*

- MM\_TypeInfoList [DCM::DeviceControl::MM\\_GetTypeInfo](#) (in IPS\_Ref\_t RefPhys, in MM\_ID\_Category ID\_Cat, in DeviceLevel Level) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get static info of measurements according to category and level.*

- MM\_TypeInfoList\_V2 [DCM::DeviceControl::MM\\_GetTypeInfo\\_V2](#) (in IPS\_Ref\_t RefPhys, in MM\_ID\_Category ID\_Cat, in DeviceLevel Level) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get static info of measurements according to category and level (V2: field added).*

- MM\_TypeInfoList [DCM::DeviceControl::MM\\_GetTypeInfoForTypeIDs](#) (in unsigned short Board, in MM\_TypeIDList MM\_TypeIDs) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get static info of measurements according MM\_TypeID.*

- MM\_MeasurementStatList [DCM::DeviceControl::MM\\_GetNbrOpenMeasurements](#) (in IPS\_RefTS\_t TSref, in MM\_ID\_Category ID\_Cat, in DeviceLevel Level) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get number of open measurements according to category and level.*

- MM\_MeasurementStatList [DCM::DeviceControl::MM\\_GetNbrOpenMeasurementsOnLevel](#) (in IPS\_RefTS\_t TSref, in MM\_ID\_Category ID\_Cat, in DeviceLevel Level) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get number of open measurements according to category and level.*

- MM\_MeasurementList [DCM::DeviceControl::MM\\_GetAllMeasurements](#) (in IPS\_RefTS\_t TSref, in MM\_ID\_Category ID\_Cat, in DeviceLevel Level) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get all measurements according to category and level.*

- MM\_MeasurementList [DCM::DeviceControl::MM\\_GetOpenMeasurements](#) (in IPS\_RefTS\_t TSref, in MM\_ID\_Category ID\_Cat, in DeviceLevel Level) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get all open measurements according to category and level.*

- MM\_MeasurementList [DCM::DeviceControl::MM\\_GetMeasurements](#) (in IPS\_RefTS\_t TSref, in MM\_IDList List) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get measurements according to a list of references.*

- void [DCM::DeviceControl::SetBitrateErrorThreshold](#) (in unsigned short BoardNr, in BoardBitrateThreshold BitrateThreshold) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Sets the service loss bitrate threshold (for video, audio and data) on the given board.*

- void [DCM::DeviceControl::GetBitrateErrorThreshold](#) (in unsigned short BoardNr, out BoardBitrateThreshold BitrateThreshold) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Gets the service loss bitrate threshold (for video, audio and data) on the given board.*

- void [DCM::DeviceControl::MM\\_SetErrorInterval](#) (in IPS\_Ref\_t RefPhys, in MM\_MessageTypeErrorIntervalList List) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Sets the intervals for the given messages on the given board.*

- void [DCM::DeviceControl::MM\\_GetErrorInterval](#) (in IPS\_Ref\_t RefPhys, out MM\_MessageTypeErrorIntervalList List) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Gets the error intervals for all error types on the given board.*

- void [DCM::DeviceControl::SetGenerateAlarmsIfGroomed](#) (in IPS\_Ref\_t RefPhys, in boolean GenerateGroomedOnly) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Set whether alarms will only be generated if groomed.*

- void [DCM::DeviceControl::GetGenerateAlarmsIfGroomed](#) (in IPS\_Ref\_t RefPhys, out boolean GenerateGroomedOnly) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get whether alarms will only be generated for groomed services.*

- void [DCM::DeviceControl::SetNtpAlarmOffset](#) (in long Offset) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Set the NTP offset alarm threshold value.*

- void [DCM::DeviceControl::GetNtpAlarmOffset](#) (out long Offset) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the NTP offset alarm threshold value.*

- void [DCM::DeviceControl::SetCardOperFailureTriggers](#) (in CofTriggerList\_t TriggerList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Sets the trigger for card not operational failure alarms for one or more cards.*

- void [DCM::DeviceControl::GetCardOperFailureTriggers](#) (out CofTriggerList\_t TriggerList) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Retrieves the triggers for card not operational failure alarms for all cards.*

### 8.58.1 Detailed Description

This module groups measurements types, enums and methods as well as alarms related things.

### 8.58.2 Typedef Documentation

#### 8.58.2.1 typedef sequence<CofTrigger\_t> DCM::DeviceControl::CofTriggerList\_t

List of card not operational failure alarm triggers.

This is a sequence of [CofTrigger\\_t](#).

Definition at line 22951 of file DCM.idl.

#### 8.58.2.2 typedef sequence<MM\_Measurement> DCM::DeviceControl::MM\_MeasurementList

A sequence of [MM\\_Measurement](#).

Definition at line 22586 of file DCM.idl.

#### 8.58.2.3 typedef sequence<MM\_MeasurementStat> DCM::DeviceControl::MM\_MeasurementStat-List

A sequence of [MM\\_MeasurementStat](#).

Definition at line 22637 of file DCM.idl.

#### 8.58.2.4 typedef sequence<MM\_Message> DCM::DeviceControl::MM\_MessageList

A sequence of [MM\\_Message](#).

Definition at line 22342 of file DCM.idl.

#### 8.58.2.5 typedef sequence<MM\_MessageSetting> DCM::DeviceControl::MM\_MessageSettingList

A sequence of [MM\\_MessageSetting](#).

Definition at line 22474 of file DCM.idl.

#### 8.58.2.6 typedef sequence<MM\_MessageTypeErrorInterval> DCM::DeviceControl::MM\_Message- TypeErrorIntervalList

Definition at line 22851 of file DCM.idl.

#### 8.58.2.7 typedef sequence<MM\_MessageTypeSetting> DCM::DeviceControl::MM\_MessageType- SettingList

A sequence of [MM\\_MessageTypeSetting](#).

Definition at line 22471 of file DCM.idl.

**8.58.2.8 typedef sequence<MM\_TypeInfo> DCM::DeviceControl::MM\_TypeInfoList**

A sequence of [MM\\_TypeInfo](#).

Definition at line 22609 of file DCM.idl.

**8.58.2.9 typedef sequence<MM\_TypeInfo\_V2> DCM::DeviceControl::MM\_TypeInfoList\_V2**

A sequence of [MM\\_TypeInfo\\_V2](#).

Definition at line 22627 of file DCM.idl.

**8.58.3 Enumeration Type Documentation****8.58.3.1 enum DCM::DeviceControl::DeviceLevel**

Enumerator:

*DL\_DeviceLevel*  
*DL\_BoardLevel*  
*DL\_PortLevel*  
*DL\_TSLevel*  
*DL\_ServiceLevel*  
*DL\_ComponentLevel*

Definition at line 22588 of file DCM.idl.

**8.58.3.2 enum DCM::DeviceControl::eBoardPresenceTrigger\_t**

Defines the triggers for raising a card not operational failure alarm.

Enumerator:

*ePresent* Only trigger the card not operational failure alarm if the board < is physically present.  
*eAlways* Always trigger the card not operational failure alarm, even if < the board is not physically present.

Definition at line 22929 of file DCM.idl.

**8.58.3.3 enum DCM::DeviceControl::eMessage**

Enumerator:

*ePAT* PAT error.  
*ePMT* PMT error.  
*eAudioVideoPid* PID error for audio/video PIDs.  
*eDataPid* PID error for data PIDs.

Definition at line 22806 of file DCM.idl.

**8.58.3.4 enum DCM::DeviceControl::MeasureType**

Enumerator:

*Binary*

*Analog*

Definition at line 22237 of file DCM.idl.

**8.58.3.5 enum DCM::DeviceControl::MeasureValidity**

Enumerator:

*MeasValidity\_NotValid*

*MeasValidity\_NotDefined*

*MeasValidity\_Defined*

Definition at line 22243 of file DCM.idl.

**8.58.3.6 enum DCM::DeviceControl::MM\_ID\_Category**

Rosa Like message categories.

Enumerator:

*MM\_ID\_CatAll*

*MM\_ID\_CatOther*

*MM\_ID\_CatInput*

*MM\_ID\_CatOutput*

Definition at line 22251 of file DCM.idl.

**8.58.3.7 enum DCM::DeviceControl::MM\_MeasureStatus**

Enumerator:

*AlarmBegin* Major,Minor,Critical, Warning.

*AlarmEnd* Cleared.

Definition at line 22568 of file DCM.idl.

**8.58.3.8 enum DCM::DeviceControl::MsgBehaviour**

Rosa like message behaviour indicators.

Enumerator:

*NotPending*

*ClearedByUser*

*ClearedBySystem*

Definition at line 22289 of file DCM.idl.

**8.58.3.9 enum DCM::DeviceControl::MsgClass**

Rosa like message classes.

Enumerator:

*Communication*

*Quality*  
*Processing*  
*Equipment*  
*Environmental*

Definition at line 22297 of file DCM.idl.

#### 8.58.3.10 enum DCM::DeviceControl::MsgSeverity

Rosa like message severity indicators.

Enumerator:

*Indeterminate*  
*Critical*  
*Major*  
*Minor*  
*Warning*  
*Cleared*  
*Information*

Definition at line 22260 of file DCM.idl.

#### 8.58.3.11 enum DCM::DeviceControl::MsgStatus

Rosa like message status indicators.

Enumerator:

*Open*  
*Closed*  
*OpenMinorUpper*  
*OpenMinorLower*  
*OpenMajorUpper*  
*OpenMajorLower*  
*ClosedMinorUpper*  
*ClosedMinorLower*  
*ClosedMajorUpper*  
*ClosedMajorLower*  
*NotDefined*  
*NotValid*

Definition at line 22272 of file DCM.idl.

## 8.58.4 Function Documentation

**8.58.4.1** void DCM::DeviceControl::GenerateTestMsg ( ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

causes a test message to be sent.

## Exceptions

|                       |                                                                       |
|-----------------------|-----------------------------------------------------------------------|
| <i>TimeOut</i>        | Never thrown.                                                         |
| <i>OpNotSucceeded</i> | Never thrown.                                                         |
| <i>OpNotAllowed</i>   | Not logged on.                                                        |
| <i>OpNotSupported</i> | Thrown if this call is not supported in the running software version. |

**8.58.4.2** void DCM::DeviceControl::GetAllMsgEnabled ( out octet *AllMsgEnabled* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get Specification whether all messages are enabled.

## Parameters

|     |                      |                                |
|-----|----------------------|--------------------------------|
| out | <i>AllMsgEnabled</i> | 0=all disabled, 1=all enabled. |
|-----|----------------------|--------------------------------|

## Exceptions

|                       |                                                                       |
|-----------------------|-----------------------------------------------------------------------|
| <i>TimeOut</i>        | Never thrown.                                                         |
| <i>OpNotSucceeded</i> | A timeout occurred during IIOP processing.                            |
| <i>OpNotAllowed</i>   | Not logged on.                                                        |
| <i>OpNotSupported</i> | Thrown if this call is not supported in the running software version. |

**8.58.4.3** void DCM::DeviceControl::GetBitrateErrorThreshold ( in unsigned short *BoardNr*, out BoardBitrateThreshold *BitrateThreshold* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the service loss bitrate threshold (for video, audio and data) on the given board.

## Parameters

|     |                          |                                                                             |
|-----|--------------------------|-----------------------------------------------------------------------------|
| in  | <i>BoardNr</i>           | is the board number                                                         |
| out | <i>Bitrate-Threshold</i> | is the bitrate thresholds for video, audio and data service losses returned |

## Returns

List of thresholds for video, audio and data.

**8.58.4.4** void DCM::DeviceControl::GetCardOperFailureTriggers ( out CofTriggerList\_t *TriggerList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Retrieves the triggers for card not operational failure alarms for all cards.

**Parameters**

|    |                    |                                                         |
|----|--------------------|---------------------------------------------------------|
| in | <i>TriggerList</i> | a list containing for each card a trigger configuration |
|----|--------------------|---------------------------------------------------------|

**Exceptions**

|                       |               |
|-----------------------|---------------|
| <i>OpNotAllowed</i>   | not logged on |
| <i>OpNotSucceeded</i> | never thrown  |
| <i>OpNotSupported</i> | never thrown  |
| <i>Timeout</i>        | never thrown  |

**8.58.4.5** void DCM::DeviceControl::GetGenerateAlarmsIfGroomed ( in IPS\_Ref\_t *RefPhys*, out boolean *GenerateGroomedOnly* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get whether alarms will only be generated for groomed services.

Board wide setting to filter alarms. When this option is set, alarms will only be generated for services that are referred to on the output (either active or configured as backup). By default, the generated only if groomed option will be set.

**Parameters**

|     |                               |                                                                                                                        |
|-----|-------------------------------|------------------------------------------------------------------------------------------------------------------------|
| in  | <i>RefPhys</i>                | specifies BoardNr and PortNr.                                                                                          |
| out | <i>GenerateGroomedOnly</i> ,: | TRUE if alarms are generated for groomed services FALSE if alarms are always generated (also for not groomed services) |

**Exceptions**

|                       |                                                                                                           |
|-----------------------|-----------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | when BoardNr = 0 = Main board.                                                                            |
| <i>OpNotSucceeded</i> | in case of <ul style="list-style-type: none"> <li>Invalid references RefPhys (BoardNr, PortNr)</li> </ul> |

**8.58.4.6** MessageBufferInfo DCM::DeviceControl::GetMessageBufferInfo ( ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the current status of the MsgBuffer.

**Returns**

MM\_MessageList list of messages with MsgNbr between and including StartMsgNbr and EndMsgNbr.

**Exceptions**

|                       |                                                                       |
|-----------------------|-----------------------------------------------------------------------|
| <i>Timeout</i>        | Never thrown.                                                         |
| <i>OpNotSucceeded</i> | Never thrown.                                                         |
| <i>OpNotAllowed</i>   | Not logged on.                                                        |
| <i>OpNotSupported</i> | Thrown if this call is not supported in the running software version. |

**8.58.4.7** void DCM::DeviceControl::GetNtpAlarmOffset ( out long *Offset* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the NTP offset alarm threshold value.

#### Parameters

|     |               |                                                  |
|-----|---------------|--------------------------------------------------|
| out | <i>Offset</i> | NTP offset alarm threshold value in milliseconds |
|-----|---------------|--------------------------------------------------|

#### Exceptions

|                       |                                  |
|-----------------------|----------------------------------|
| <i>OpNotSupported</i> | when BoardNr != 0 ( Main board). |
|-----------------------|----------------------------------|

**8.58.4.8** MM\_MeasurementList DCM::DeviceControl::MM\_GetAllMeasurements ( in IPS\_RefTS\_t *TSref*, in MM\_ID\_Category *ID\_Cat*, in DeviceLevel *Level* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get all measurements according to category and level.

#### Parameters

|    |               |                                               |
|----|---------------|-----------------------------------------------|
| in | <i>TSref</i>  | Specifies BoardNr & PortNr.and TS.            |
| in | <i>ID_Cat</i> | Specifies category.                           |
| in | <i>Level</i>  | Specifies Level in hierarchy of measurements. |

#### Returns

MM\_MeasurementList list of measurements.

#### Exceptions

|                       |                                                                                                                                          |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | Never thrown.                                                                                                                            |
| <i>OpNotSucceeded</i> | in case of <ul style="list-style-type: none"> <li>• A timeout occurred during IIOP processing.</li> <li>• Invalid parameters.</li> </ul> |
| <i>OpNotAllowed</i>   | Not logged on.                                                                                                                           |
| <i>OpNotSupported</i> | Thrown if this call is not supported in the running software version.                                                                    |

#### Note

all measurements below the specified level are included.  
in MM\_MeasurementStatList, MM\_TypeID is always masked, other references are masked according to level.

**8.58.4.9** void DCM::DeviceControl::MM\_GetAllOpenMsgStatus ( out unsigned short *OldestSeqNumber*, out unsigned short *LatestSeqNumber*, out MM\_Message *OldestMessage*, out MM\_Message *LatestMessage*, out MM\_MessageList *OpenMessageList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets all messages with open status plus current message buffer info.

**Parameters**

|     |                         |                                                   |
|-----|-------------------------|---------------------------------------------------|
| out | <i>OldestSeq-Number</i> | sequence number of oldest message in buffer.      |
| out | <i>LatestSeq-Number</i> | sequence number of most recent message in buffer. |
| out | <i>OldestMessage</i>    | info of oldest message in buffer.                 |
| out | <i>LatestMessage</i>    | info of most recent message in buffer.            |
| out | <i>OpenMessage-List</i> | list of messages with open status.                |

**Exceptions**

|                       |                                                                       |
|-----------------------|-----------------------------------------------------------------------|
| <i>TimeOut</i>        | Never thrown.                                                         |
| <i>OpNotSucceeded</i> | A timeout occurred during IIOP processing.                            |
| <i>OpNotAllowed</i>   | Not logged on.                                                        |
| <i>OpNotSupported</i> | Thrown if this call is not supported in the running software version. |

**8.58.4.10** void DCM::DeviceControl::MM\_GetErrorInterval ( in IPS\_Ref\_t *RefPhys*, out MM\_MessageTypeErrorIntervalList *List* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Gets the error intervals for all error types on the given board.

**Parameters**

|     |                |                                               |
|-----|----------------|-----------------------------------------------|
| in  | <i>RefPhys</i> | board information, port is masked.            |
| out | <i>List</i>    | The MM_MessageTypeErrorIntervalList returned. |

**Returns**

List of all intervals.

**8.58.4.11** MM\_MeasurementList DCM::DeviceControl::MM\_GetMeasurements ( in IPS\_RefTS\_t *TSref*, in MM\_IDList *List* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get measurements according to a list of references.

**Parameters**

|    |              |                                                                |
|----|--------------|----------------------------------------------------------------|
| in | <i>TSref</i> | Specifies BoardNr & PortNr.and TS (PortNr and TS are ignored). |
| in | <i>List</i>  | list of references.                                            |

**Returns**

MM\_MeasurementList list of measurements.

**Exceptions**

|                       |                                                                                                                                          |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | Never thrown.                                                                                                                            |
| <i>OpNotSucceeded</i> | in case of <ul style="list-style-type: none"> <li>• A timeout occurred during IIOP processing.</li> <li>• Invalid parameters.</li> </ul> |
| <i>OpNotAllowed</i>   | Not logged on.                                                                                                                           |
| <i>OpNotSupported</i> | Thrown if this call is not supported in the running software version.                                                                    |

**8.58.4.12** **MM\_MessageList DCM::DeviceControl::MM\_GetMessageList ( in unsigned long StartMsgNbr, in unsigned long EndMsgNbr ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)**

Used to get the a sequence of messages from the device.

**Parameters**

|    |                    |                                 |
|----|--------------------|---------------------------------|
| in | <i>StartMsgNbr</i> | MsgNbr of first message to get. |
| in | <i>EndMsgNbr</i>   | MsgNbr of last message to get.  |

**Returns**

MM\_MessageList list of messages with MsgNbr between and including StartMsgNbr and EndMsgNbr.

**Exceptions**

|                       |                                                                       |
|-----------------------|-----------------------------------------------------------------------|
| <i>TimeOut</i>        | Never thrown.                                                         |
| <i>OpNotSucceeded</i> | A timeout occurred during IIOP processing.                            |
| <i>OpNotAllowed</i>   | Not logged on.                                                        |
| <i>OpNotSupported</i> | Thrown if this call is not supported in the running software version. |

**8.58.4.13** **void DCM::DeviceControl::MM\_GetMsgSettingL ( out MM\_MessageSettingList List ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)**

Get settings per message.

**Parameters**

|     |             |                                                  |
|-----|-------------|--------------------------------------------------|
| out | <i>List</i> | Specifies messages and the settings per message. |
|-----|-------------|--------------------------------------------------|

**Exceptions**

|                       |                                                                       |
|-----------------------|-----------------------------------------------------------------------|
| <i>TimeOut</i>        | Never thrown.                                                         |
| <i>OpNotSucceeded</i> | A timeout occurred during IIOP processing.                            |
| <i>OpNotAllowed</i>   | Not logged on.                                                        |
| <i>OpNotSupported</i> | Thrown if this call is not supported in the running software version. |

**Note**

not implemented yet, so OpNotSupported will always be raised.  
a RefPhys parameter will probably be added.

**8.58.4.14** void DCM::DeviceControl::MM\_GetMsgTypeSettingL ( in IPS\_Ref\_t *RefPhys*, out MM\_MessageTypeSettingList *List* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get settings per message-type.

**Parameters**

|     |                |                                                            |
|-----|----------------|------------------------------------------------------------|
| in  | <i>RefPhys</i> | Specifies BoardNr & PortNr (PortNr is ignored).            |
| out | <i>List</i>    | Specifies message-types and the settings per message-type. |

**Exceptions**

|                       |                                                                                                                                          |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | Never thrown.                                                                                                                            |
| <i>OpNotSucceeded</i> | in case of <ul style="list-style-type: none"> <li>• A timeout occurred during IIOP processing.</li> <li>• Invalid parameters.</li> </ul> |
| <i>OpNotAllowed</i>   | Not logged on.                                                                                                                           |
| <i>OpNotSupported</i> | Thrown if this call is not supported in the running software version.                                                                    |

**8.58.4.15** MM\_MeasurementStatList DCM::DeviceControl::MM\_GetNbrOpenMeasurements ( in IPS\_RefTS\_t *TSref*, in MM\_ID\_Category *ID\_Cat*, in DeviceLevel *Level* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get number of open measurements according to category and level.

**Parameters**

|    |               |                                               |
|----|---------------|-----------------------------------------------|
| in | <i>TSref</i>  | Specifies BoardNr & PortNr.and TS.            |
| in | <i>ID_Cat</i> | Specifies category.                           |
| in | <i>Level</i>  | Specifies Level in hierarchy of measurements. |

**Returns**

MM\_MeasurementStatList list of measurement statistics.

**Exceptions**

|                       |                                                                                                                                          |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | Never thrown.                                                                                                                            |
| <i>OpNotSucceeded</i> | in case of <ul style="list-style-type: none"> <li>• A timeout occurred during IIOP processing.</li> <li>• Invalid parameters.</li> </ul> |
| <i>OpNotAllowed</i>   | Not logged on.                                                                                                                           |
| <i>OpNotSupported</i> | Thrown if this call is not supported in the running software version.                                                                    |

**Note**

number of all open measurements below the specified level are included.  
 in MM\_MeasurementStatList, MM\_TypeID is always masked, other references are masked according to level.

**8.58.4.16 MM\_MeasurementStatList DCM::DeviceControl::MM\_GetNbrOpenMeasurementsOnLevel**  
 ( in IPS\_RefTS\_t *TSref*, in MM\_ID\_Category *ID\_Cat*, in DeviceLevel *Level* ) raises  
 (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get number of open measurements according to category and level.

**Parameters**

|    |               |                                               |
|----|---------------|-----------------------------------------------|
| in | <i>TSref</i>  | Specifies BoardNr & PortNr.and TS.            |
| in | <i>ID_Cat</i> | Specifies category.                           |
| in | <i>Level</i>  | Specifies Level in hierarchy of measurements. |

**Returns**

MM\_MeasurementStatList list of measurement statistics.

**Exceptions**

|                       |                                                                                                                                          |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | Never thrown.                                                                                                                            |
| <i>OpNotSucceeded</i> | in case of <ul style="list-style-type: none"> <li>• A timeout occurred during IIOP processing.</li> <li>• Invalid parameters.</li> </ul> |
| <i>OpNotAllowed</i>   | Not logged on.                                                                                                                           |
| <i>OpNotSupported</i> | Thrown if this call is not supported in the running software version.                                                                    |

**Note**

number of all open measurements below the specified level are NOT included.  
 in MM\_MeasurementStatList, MM\_TypeID is always masked, other references are masked according to level.

**Version**

7.0

**8.58.4.17 MM\_MeasurementList DCM::DeviceControl::MM\_GetOpenMeasurements** ( in  
 IPS\_RefTS\_t *TSref*, in MM\_ID\_Category *ID\_Cat*, in DeviceLevel *Level* ) raises (TimeOut,  
 OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get all open measurements according to category and level.

**Parameters**

|    |               |                                               |
|----|---------------|-----------------------------------------------|
| in | <i>TSref</i>  | Specifies BoardNr & PortNr.and TS.            |
| in | <i>ID_Cat</i> | Specifies category.                           |
| in | <i>Level</i>  | Specifies Level in hierarchy of measurements. |

**Returns**

MM\_MeasurementList list of open measurements.

**Exceptions**

|                       |                                                                                                                                          |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | Never thrown.                                                                                                                            |
| <i>OpNotSucceeded</i> | in case of <ul style="list-style-type: none"> <li>• A timeout occurred during IIOP processing.</li> <li>• Invalid parameters.</li> </ul> |
| <i>OpNotAllowed</i>   | Not logged on.                                                                                                                           |
| <i>OpNotSupported</i> | Thrown if this call is not supported in the running software version.                                                                    |

**Note**

all measurements below the specified level are included.  
in MM\_MeasurementStatList, MM\_TypeID is always masked, other references are masked according to level.

#### 8.58.4.18 MM\_TypeInfoList DCM::DeviceControl::MM\_GetTypeInfo ( in IPS\_Ref\_t *RefPhys*, in MM\_ID\_Category *ID\_Cat*, in DeviceLevel *Level* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get static info of measurements according to category and level.

**Parameters**

|    |                |                                               |
|----|----------------|-----------------------------------------------|
| in | <i>RefPhys</i> | Specifies BoardNr & PortNr.                   |
| in | <i>ID_Cat</i>  | Specifies category.                           |
| in | <i>Level</i>   | Specifies Level in hierarchy of measurements. |

**Returns**

MM\_TypeInfoList list of static measurement info.

**Exceptions**

|                       |                                                                                                                                          |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | Never thrown.                                                                                                                            |
| <i>OpNotSucceeded</i> | in case of <ul style="list-style-type: none"> <li>• A timeout occurred during IIOP processing.</li> <li>• Invalid parameters.</li> </ul> |
| <i>OpNotAllowed</i>   | Not logged on.                                                                                                                           |
| <i>OpNotSupported</i> | Thrown if this call is not supported in the running software version.                                                                    |

**Note**

info of all measurements below the specified level are included.

**8.58.4.19** `MM_TypeInfoList_V2 DCM::DeviceControl::MM_GetTypeInfo_V2 ( in IPS_Ref_t RefPhys, in MM_ID_Category ID_Cat, in DeviceLevel Level )` raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get static info of measurements according to category and level (V2: field added).

**Parameters**

|    |                |                                               |
|----|----------------|-----------------------------------------------|
| in | <i>RefPhys</i> | Specifies BoardNr & PortNr.                   |
| in | <i>ID_Cat</i>  | Specifies category.                           |
| in | <i>Level</i>   | Specifies Level in hierarchy of measurements. |

**Returns**

MM\_TypeInfoList list of static measurement info.

**Exceptions**

|                       |                                                                                                                                       |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | Never thrown.                                                                                                                         |
| <i>OpNotSucceeded</i> | in case of <ul style="list-style-type: none"><li>• A timeout occurred during IIOP processing.</li><li>• Invalid parameters.</li></ul> |
| <i>OpNotAllowed</i>   | Not logged on.                                                                                                                        |
| <i>OpNotSupported</i> | Thrown if this call is not supported in the running software version.                                                                 |

**Note**

info of all measurements below the specified level are included.

**8.58.4.20** `MM_TypeInfoList DCM::DeviceControl::MM_GetTypeInfoForTypeIDs ( in unsigned short Board, in MM_TypeIDList MM_TypeIDs )` raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get static info of measurements according MM\_TypeID.

**Parameters**

|    |                   |                                                                  |
|----|-------------------|------------------------------------------------------------------|
| in | <i>Board</i>      | Specifies BoardNr.                                               |
| in | <i>MM_TypeIDs</i> | Specifies list of MM_TypeIDs for which the TypeInfo is required. |

**Returns**

MM\_TypeInfoList list of static measurement info.

**Exceptions**

|                       |                                                                                                           |
|-----------------------|-----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | Never thrown.                                                                                             |
| <i>OpNotSucceeded</i> | in case of <ul style="list-style-type: none"> <li>• A timeout occurred during IIOP processing.</li> </ul> |
| <i>OpNotAllowed</i>   | Not logged on.                                                                                            |
| <i>OpNotSupported</i> | Thrown if this call is not supported in the running software version.                                     |

**8.58.4.21** void DCM::DeviceControl::MM\_SetErrorInterval ( in IPS\_Ref\_t *RefPhys*, in MM\_MessageTypeErrorIntervalList *List* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Sets the intervals for the given messages on the given board.

**Parameters**

|    |                |                                   |
|----|----------------|-----------------------------------|
| in | <i>RefPhys</i> | board information, port is masked |
| in | <i>List</i>    | list of error intervals           |

**Exceptions**

|                       |                                                                                                                                                       |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | If RefPhys port isn't masked, List's RefPhys isn't equal to RefPhys parameter or one of the values is out of range, or an invalid board is specified. |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|

**8.58.4.22** void DCM::DeviceControl::MM\_SetMsgSettingL ( in MM\_MessageSettingList *List* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set settings per message.

**Parameters**

|    |             |                                                  |
|----|-------------|--------------------------------------------------|
| in | <i>List</i> | Specifies messages and the settings per message. |
|----|-------------|--------------------------------------------------|

**Exceptions**

|                       |                                                                                                                                          |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | Never thrown.                                                                                                                            |
| <i>OpNotSucceeded</i> | in case of <ul style="list-style-type: none"> <li>• A timeout occurred during IIOP processing.</li> <li>• Invalid parameters.</li> </ul> |
| <i>OpNotAllowed</i>   | Not logged on.                                                                                                                           |
| <i>OpNotSupported</i> | Thrown if this call is not supported in the running software version.                                                                    |

**Note**

not implemented yet, so OpNotSupported will always be raised.  
a RefPhys parameter will probably be added.

**8.58.4.23** void DCM::DeviceControl::MM\_SetMsgTypeSettingL ( in IPS\_Ref\_t *RefPhys*, in MM\_MessageTypeSettingList *List* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set settings per message-type.

**Parameters**

|    |                |                                                            |
|----|----------------|------------------------------------------------------------|
| in | <i>RefPhys</i> | Specifies BoardNr & PortNr (PortNr is ignored).            |
| in | <i>List</i>    | Specifies message-types and the settings per message-type. |

**Exceptions**

|                       |                                                                                                                                          |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | Never thrown.                                                                                                                            |
| <i>OpNotSucceeded</i> | in case of <ul style="list-style-type: none"> <li>• A timeout occurred during IIOP processing.</li> <li>• Invalid parameters.</li> </ul> |
| <i>OpNotAllowed</i>   | Not logged on.                                                                                                                           |
| <i>OpNotSupported</i> | Thrown if this call is not supported in the running software version.                                                                    |

**8.58.4.24** void DCM::DeviceControl::SetAllMsgEnabled ( in octet *AllMsgEnabled* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Specify whether all messages are enabled.

**Parameters**

|    |                      |                                        |
|----|----------------------|----------------------------------------|
| in | <i>AllMsgEnabled</i> | 0=all disabled, otherwise all enabled. |
|----|----------------------|----------------------------------------|

**Exceptions**

|                       |                                                                       |
|-----------------------|-----------------------------------------------------------------------|
| <i>TimeOut</i>        | Never thrown.                                                         |
| <i>OpNotSucceeded</i> | A timeout occurred during IIOP processing.                            |
| <i>OpNotAllowed</i>   | Not logged on.                                                        |
| <i>OpNotSupported</i> | Thrown if this call is not supported in the running software version. |

**8.58.4.25** void DCM::DeviceControl::SetBitrateErrorThreshold ( in unsigned short *BoardNr*, in BoardBitrateThreshold *BitrateThreshold* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Sets the service loss bitrate threshold (for video, audio and data) on the given board.

**Parameters**

|    |                          |                                                                   |
|----|--------------------------|-------------------------------------------------------------------|
| in | <i>BoardNr</i>           | is the board number                                               |
| in | <i>Bitrate-Threshold</i> | is the bitrate threshold for video, audio and data service losses |

**Exceptions**

|                       |                                                                         |
|-----------------------|-------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | If one of the values is out of range, or an invalid board is specified. |
|-----------------------|-------------------------------------------------------------------------|

**8.58.4.26** void DCM::DeviceControl::SetCardOperFailureTriggers ( in CofTriggerList\_t *TriggerList* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Sets the trigger for card not operational failure alarms for one or more cards.

**Parameters**

|    |                    |                                                         |
|----|--------------------|---------------------------------------------------------|
| in | <i>TriggerList</i> | a list containing for each card a trigger configuration |
|----|--------------------|---------------------------------------------------------|

**Exceptions**

|                       |                                                                                                                                        |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | when TriggerList is emptyr or TriggerList contains a CofTrigger with BoardNr equal to invalid number, e.g. 0 (Main board) or overflow. |
| <i>OpNotAllowed</i>   | not logged on                                                                                                                          |
| <i>OpNotSupported</i> | never thrown                                                                                                                           |
| <i>Timeout</i>        | never thrown                                                                                                                           |

**8.58.4.27** void DCM::DeviceControl::SetGenerateAlarmsIfGroomed ( in IPS\_Ref\_t *RefPhys*, in boolean *GenerateGroomedOnly* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set whether alarms will only be generated if groomed.

Board wide setting to filter alarms. When this option is set, alarms will only be generated for services that are referred to on the output (either active or configured as backup). This is the default.

**Parameters**

|    |                               |                                                                                                                        |
|----|-------------------------------|------------------------------------------------------------------------------------------------------------------------|
| in | <i>RefPhys</i>                | specifies BoardNr and PortNr.                                                                                          |
| in | <i>Generate-GroomedOnly,:</i> | TRUE if alarms are generated for groomed services FALSE if alarms are always.generated (also for not groomed services) |

**Exceptions**

|                       |                                                                                                           |
|-----------------------|-----------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | when BoardNr = 0 = Main board.                                                                            |
| <i>OpNotSucceeded</i> | in case of <ul style="list-style-type: none"> <li>Invalid references RefPhys (BoardNr, PortNr)</li> </ul> |

**Note**

This setting only affects service loss alarms in version 3.0.

**8.58.4.28** void DCM::DeviceControl::SetNtpAlarmOffset ( in long *Offset* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the NTP offset alarm threshold value.

**Parameters**

|           |               |                                                  |
|-----------|---------------|--------------------------------------------------|
| <i>in</i> | <i>Offset</i> | NTP offset alarm threshold value in milliseconds |
|-----------|---------------|--------------------------------------------------|

**Exceptions**

|                       |                                 |
|-----------------------|---------------------------------|
| <i>OpNotSupported</i> | when BoardNr != 0 (Main board). |
|-----------------------|---------------------------------|

**8.58.4.29** void DCM::DeviceControl::UpdatePendingTestAlarm ( in unsigned short *Board*, in octet *Action*, in string *Detail* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

update a test alarm via user input.

**Parameters**

|           |               |                                                            |
|-----------|---------------|------------------------------------------------------------|
| <i>in</i> | <i>Board</i>  | Update Alarm on a certain board (in a multi-board device). |
| <i>in</i> | <i>Action</i> | Update Alarm according to a certain action (see above).    |
| <i>in</i> | <i>Detail</i> | Update Alarm Detail (only visible when alarm is set).      |

**Exceptions**

|                       |                                                                       |
|-----------------------|-----------------------------------------------------------------------|
| <i>TimeOut</i>        | Never thrown.                                                         |
| <i>OpNotSucceeded</i> | Never thrown.                                                         |
| <i>OpNotAllowed</i>   | Not logged on.                                                        |
| <i>OpNotSupported</i> | Thrown if this call is not supported in the running software version. |

**8.58.5 Variable Documentation**

**8.58.5.1** const octet DCM::DeviceControl::AlarmAsBackupTriggerMethod\_Default = 1

Alarm can be used as backuptrigger and will be displayed in the default way (non default presentations can be added)

Definition at line 22612 of file DCM.idl.

**8.58.5.2** const octet DCM::DeviceControl::AlarmAsBackupTriggerMethod\_NotAllowed = 0

Alarm can not be used as backuptrigger.

Definition at line 22611 of file DCM.idl.

- typedef sequence< IPSecHost > [DCM::DeviceControl::IPSecHostList](#)

### Functions

- void [DCM::DeviceControl::IPSec\\_HostAddL](#) (in IPSecHostList HostList) raises (TimeOut, OutOfRange, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Adds a host for which [DCM](#) requires IPsec to be used in order to communicate over the management network.*
- void [DCM::DeviceControl::IPSec\\_HostDeleteL](#) (in IPSecHostList HostList) raises (TimeOut, OutOfRange, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Removes a host for which [DCM](#) requires IPsec to be used in order to communicate over the management network.*
- void [DCM::DeviceControl::IPSec\\_HostChangeL](#) (in IPSecHostList HostList) raises (TimeOut, OutOfRange, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Changes the pre-shared key for a host.*
- void [DCM::DeviceControl::IPSec\\_HostGetL](#) (out IPSecHostList HostList) raises (TimeOut, OutOfRange, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Returns the list of hosts for which [DCM](#) requires IPsec to be used in order to communicate over the management network.*
- void [DCM::DeviceControl::IPSec\\_SetRequireIPSec](#) (in IPS\_Ref\_t PhysPort, in boolean enabled) raises (TimeOut, OutOfRange, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Enables or disables non-IPsec IP data for the given management interface.*
- void [DCM::DeviceControl::IPSec\\_GetRequireIPSec](#) (in IPS\_Ref\_t PhysPort, out boolean enabled) raises (TimeOut, OutOfRange, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Indicates whether non-IPsec IP data is allowed to go through the given management port.*

#### 8.60.1 Detailed Description

Types and methods to configure IPsec on the management ports.

#### 8.60.2 Typedef Documentation

##### 8.60.2.1 typedef sequence<IPSecHost> DCM::DeviceControl::IPSecHostList

Definition at line 24455 of file DCM.idl.

## 8.60.3 Function Documentation

**8.60.3.1 void DCM::DeviceControl::IPSec\_GetRequireIPSec ( in IPS\_Ref t *PhysPort*, out boolean *enabled* ) raises (TimeOut, OutOfRange, OpNotSucceeded, OpNotAllowed, OpNotSupported)**

Indicates whether non-IPSec IP data is allowed to go through the given management port.

## Parameters

|     |                 |                                                                                |
|-----|-----------------|--------------------------------------------------------------------------------|
| in  | <i>PhysPort</i> | Physical port. Board must be 0 (mainboard), Port must be 0 (10/100) or 1 (GbE) |
| out | <i>enabled</i>  | True if non-IPSec traffic is allowed for the management port.                  |

## Exceptions

|                       |                                             |
|-----------------------|---------------------------------------------|
| <i>OpNotSucceeded</i> | PhysPort does not specify a valid mgmt port |
|-----------------------|---------------------------------------------|

**8.60.3.2 void DCM::DeviceControl::IPSec\_HostAddL ( in IPSecHostList *HostList* ) raises (TimeOut, OutOfRange, OpNotSucceeded, OpNotAllowed, OpNotSupported)**

Adds a host for which [DCM](#) requires IPsec to be used in order to communicate over the management network.

## Parameters

|    |                 |                                                                                                            |
|----|-----------------|------------------------------------------------------------------------------------------------------------|
| in | <i>HostList</i> | List of hosts to add, where each host has a valid unicast ip address and a keylength not greater than 200. |
|----|-----------------|------------------------------------------------------------------------------------------------------------|

## Exceptions

|                       |                                                                                    |
|-----------------------|------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | A host has already been added, the IP address is not valid or the key is too long. |
|-----------------------|------------------------------------------------------------------------------------|

**8.60.3.3 void DCM::DeviceControl::IPSec\_HostChangeL ( in IPSecHostList *HostList* ) raises (TimeOut, OutOfRange, OpNotSucceeded, OpNotAllowed, OpNotSupported)**

Changes the pre-shared key for a host.

## Parameters

|    |                 |                                             |
|----|-----------------|---------------------------------------------|
| in | <i>HostList</i> | List of hosts to change pre-shared key for. |
|----|-----------------|---------------------------------------------|

## Exceptions

|                       |                                                      |
|-----------------------|------------------------------------------------------|
| <i>OpNotSucceeded</i> | A host is not known or a pre-shared key is too long. |
|-----------------------|------------------------------------------------------|

**8.60.3.4 void DCM::DeviceControl::IPSec\_HostDeleteL ( in IPSecHostList *HostList* ) raises (TimeOut, OutOfRange, OpNotSucceeded, OpNotAllowed, OpNotSupported)**

Removes a host for which [DCM](#) requires IPsec to be used in order to communicate over the management network.

**Parameters**

|    |                 |                                                                            |
|----|-----------------|----------------------------------------------------------------------------|
| in | <i>HostList</i> | List of hosts to delete. Only the IP-address is used to identify the host. |
|----|-----------------|----------------------------------------------------------------------------|

**Exceptions**

|                       |                      |
|-----------------------|----------------------|
| <i>OpNotSucceeded</i> | A host is not known. |
|-----------------------|----------------------|

**Note**

If the last host is deleted, the device will automatically allow non-IPSec traffic to the device and it is not re-enabled when adding new hosts.

### 8.60.3.5 void DCM::DeviceControl::IPSec\_HostGetL ( out IPSecHostList *HostList* ) raises (Timeout, OutOfRange, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Returns the list of hosts for which **DCM** requires IPSec to be used in order to communicate over the management network.

**Returns**

*HostList* List of hosts. The PreSharedKey field of the entries will contain a dummy string instead of the real key.

### 8.60.3.6 void DCM::DeviceControl::IPSec\_SetRequireIPSec ( in IPS\_Ref\_t *PhysPort*, in boolean *enabled* ) raises (Timeout, OutOfRange, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Enables or disables non-IPSec IP data for the given management interface.

Non-IPSec traffic is enabled by default. If IPSec hosts are configured and both interfaces allow non-IPSec traffic, then IPSec usage is optional. As soon as an interface disables non-IPSec traffic, the use of IPSec becomes mandatory.

**Parameters**

|    |                 |                                                                                |
|----|-----------------|--------------------------------------------------------------------------------|
| in | <i>PhysPort</i> | Physical port. Board must be 0 (mainboard), Port must be 0 (10/100) or 1 (GbE) |
| in | <i>enabled</i>  | True to allow non-IPSec traffic for the management interface, false otherwise  |

**Exceptions**

|                       |                                                                                                                                        |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | PhysPort does not specify a valid mgmt interface or an attempt was made to disable non-IPSec traffic while no IPSec hosts were defined |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------|

## 8.61 SecurityPSB

Types and methods related to compliance with PSB.

### Classes

- struct [DCM::DeviceControl::ExtIpServiceCtrl](#)
- struct [DCM::DeviceControl::IpServiceDisplayData](#)

*Description of an active or listening port.*

### Typedefs

- typedef sequence < ExtIpServiceCtrl > [DCM::DeviceControl::ExtIpServiceCtrlList](#)
- typedef sequence < IpServiceDisplayData > [DCM::DeviceControl::IpServiceDisplayDataList](#)

### Enumerations

- enum [DCM::DeviceControl::eExtIpServices](#) { [DCM::DeviceControl::eIpServiceIIOP](#), [DCM::DeviceControl::eIpServiceSSH](#), [DCM::DeviceControl::eIpServiceFTP](#), [DCM::DeviceControl::eIpServiceSNMP](#), [DCM::DeviceControl::eIpServiceIPConfig](#), [DCM::DeviceControl::eIpServiceTelnet](#), [DCM::DeviceControl::eIpServiceSNMPSvcConf](#), [DCM::DeviceControl::eIpService\\_Reserved\\_9](#), [DCM::DeviceControl::eIpService\\_Reserved\\_8](#), [DCM::DeviceControl::eIpService\\_Reserved\\_7](#), [DCM::DeviceControl::eIpService\\_Reserved\\_6](#), [DCM::DeviceControl::eIpService\\_Reserved\\_5](#), [DCM::DeviceControl::eIpService\\_Reserved\\_4](#), [DCM::DeviceControl::eIpService\\_Reserved\\_3](#), [DCM::DeviceControl::eIpService\\_Reserved\\_2](#), [DCM::DeviceControl::eIpService\\_Reserved\\_1](#), [DCM::DeviceControl::eIpService\\_Reserved\\_0](#) }

*IP services that are externally visible and that can be configured.*

- enum [DCM::DeviceControl::enPSBSocketType](#) { [DCM::DeviceControl::ePsbSocketTypeTcp](#), [DCM::DeviceControl::ePsbSocketTypeUdp](#), [DCM::DeviceControl::ePsbSocketTypeTcp6](#), [DCM::DeviceControl::ePsbSocketTypeUdp6](#), [DCM::DeviceControl::ePsbSocketTypeReserved7](#), [DCM::DeviceControl::ePsbSocketTypeReserved6](#), [DCM::DeviceControl::ePsbSocketTypeReserved5](#), [DCM::DeviceControl::ePsbSocketTypeReserved4](#), [DCM::DeviceControl::ePsbSocketTypeReserved3](#), [DCM::DeviceControl::ePsbSocketTypeReserved2](#), [DCM::DeviceControl::ePsbSocketTypeReserved1](#), [DCM::DeviceControl::ePsbSocketTypeReserved0](#) }

*Transport layer protocol type of a socket.*

### Functions

- void [DCM::DeviceControl::SetExternalIpServicesL](#) (in ExtIpServiceCtrlList Services) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Enable/disable a number of externally visible IP services.*
- void [DCM::DeviceControl::GetExternalIpServicesL](#) (out ExtIpServiceCtrlList Services) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Retrieve a list of services that can be enabled/disabled on the mainboard together with the current status of that service.*
- void [DCM::DeviceControl::GetListeningIpServicesL](#) (in unsigned short Board, out IpServiceDisplayDataList Listeners) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Retrieves a list of active and listening TCP/IP ports, alike netstat.*

### 8.61.1 Detailed Description

Types and methods related to compliance with PSB.

### 8.61.2 Typedef Documentation

#### 8.61.2.1 typedef sequence<ExtIpServiceCtrl> DCM::DeviceControl::ExtIpServiceCtrlList

Definition at line 24579 of file DCM.idl.

#### 8.61.2.2 typedef sequence<IpServiceDisplayData> DCM::DeviceControl::IpServiceDisplayDataList

Definition at line 24653 of file DCM.idl.

### 8.61.3 Enumeration Type Documentation

#### 8.61.3.1 enum DCM::DeviceControl::eExtIpServices

IP services that are externally visible and that can be configured.

Enumerator:

*eIpServiceIIOP*  
*eIpServiceSSH*  
*eIpServiceFTP*  
*eIpServiceSNMP*  
*eIpServiceIPConfig*  
*eIpServiceTelnet*  
*eIpServiceSNMPSvcConf*  
*eIpService\_Reserved\_9*  
*eIpService\_Reserved\_8*  
*eIpService\_Reserved\_7*  
*eIpService\_Reserved\_6*  
*eIpService\_Reserved\_5*  
*eIpService\_Reserved\_4*  
*eIpService\_Reserved\_3*  
*eIpService\_Reserved\_2*  
*eIpService\_Reserved\_1*  
*eIpService\_Reserved\_0*

Definition at line 24554 of file DCM.idl.

#### 8.61.3.2 enum DCM::DeviceControl::enPSBSocketType

Transport layer protocol type of a socket.

Enumerator:

*ePsbSocketTypeTcp*

*ePsbSocketTypeUdp*  
*ePsbSocketTypeTcp6*  
*ePsbSocketTypeUdp6*  
*ePsbSocketTypeReserved7*  
*ePsbSocketTypeReserved6*  
*ePsbSocketTypeReserved5*  
*ePsbSocketTypeReserved4*  
*ePsbSocketTypeReserved3*  
*ePsbSocketTypeReserved2*  
*ePsbSocketTypeReserved1*  
*ePsbSocketTypeReserved0*

Definition at line 24621 of file DCM.idl.

#### 8.61.4 Function Documentation

**8.61.4.1** void DCM::DeviceControl::GetExternalIpServicesL ( out ExtIpServiceCtrlList *Services* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Retrieve a list of services that can be enabled/disabled on the mainboard together with the current status of that service.

##### Parameters

|     |                 |                      |
|-----|-----------------|----------------------|
| out | <i>Services</i> | The list of services |
|-----|-----------------|----------------------|

##### Exceptions

|                       |                                            |
|-----------------------|--------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing. |
| <i>OpNotSupported</i> | when BoardNr != 0 (Main board).            |
| <i>OpNotAllowed</i>   | Not logged on.                             |
| <i>OpNotSucceeded</i> | Internal error                             |

##### Version

Release 8.1

**8.61.4.2** void DCM::DeviceControl::GetListeningIpServicesL ( in unsigned short *Board*, out IpServiceDisplayDataList *Listeners* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Retrieves a list of active and listening TCP/IP ports, alike netstat.

##### Parameters

|     |                  |                            |
|-----|------------------|----------------------------|
| in  | <i>Board</i>     | Board number               |
| out | <i>Listeners</i> | Netstat-like list of ports |

**Exceptions**

|                       |                                                                              |
|-----------------------|------------------------------------------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing.                                   |
| <i>OpNotSupported</i> | when BoardNr doesn't correspond to mainboard, GbE card or IP video GW card.  |
| <i>OpNotAllowed</i>   | Not logged on.                                                               |
| <i>OpNotSucceeded</i> | In case <ul style="list-style-type: none"> <li>board out of range</li> </ul> |

**Version**

Release 8.1

**8.61.4.3** void DCM::DeviceControl::SetExternalIpServicesL ( in ExtIpServiceCtrlList *Services* )  
 raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Enable/disable a number of externally visible IP services.

Only the services that are returned by GetExternalIpServicesL can be configured.

**Parameters**

|    |                 |                                                   |
|----|-----------------|---------------------------------------------------|
| in | <i>Services</i> | List of the services that need to be reconfigured |
|----|-----------------|---------------------------------------------------|

**Exceptions**

|                       |                                                                                                                                                   |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing.                                                                                                        |
| <i>OpNotSupported</i> | when BoardNr != 0 (Main board).                                                                                                                   |
| <i>OpNotAllowed</i>   | Not logged on.                                                                                                                                    |
| <i>OpNotSucceeded</i> | In case of <ul style="list-style-type: none"> <li>list contains duplicate service types</li> <li>service type out of range or reserved</li> </ul> |

**Note**

This call doesn't follow the until first error approach. If an error is found in the input parameter, no settings are applied.

**Version**

Release 8.1

## 8.62 SCRAMBLER

This module contains types, enums and methods related to the scrambler.

### Classes

- struct `DCM::DeviceControl::JclInitialValue_t`  
*JCL initial value for Hitachi.*
- struct `DCM::DeviceControl::JclSystemId_t`  
*JCL system ID for Hitachi.*

### Typedefs

- typedef sequence< unsigned long > `DCM::DeviceControl::IdList`  
*list of ID's (for several purposes)*
- typedef sequence< unsigned short > `DCM::DeviceControl::EcmIdList`  
*list of EcmId's*
- typedef sequence< unsigned short > `DCM::DeviceControl::DataIdList`  
*list of DataId's*

### Enumerations

- enum `DCM::DeviceControl::eEcmgType` { `DCM::DeviceControl::EcmgStandard`, `DCM::DeviceControl::M_Crypt`, `DCM::DeviceControl::Nagra`, `DCM::DeviceControl::Hitachi` }  
*ECMG type.*
- enum `DCM::DeviceControl::eEcmgType_V2` { `DCM::DeviceControl::EcmgType_Standard`, `DCM::DeviceControl::EcmgType_M_Crypt`, `DCM::DeviceControl::EcmgType_Nagra`, `DCM::DeviceControl::EcmgType_Hitachi`, `DCM::DeviceControl::EcmgType_PowerVu`, `DCM::DeviceControl::EcmgType_Reserved5`, `DCM::DeviceControl::EcmgType_Reserved6`, `DCM::DeviceControl::EcmgType_Reserved7`, `DCM::DeviceControl::EcmgType_Reserved8` }  
*ECMG type.*
- enum `DCM::DeviceControl::eEcmPidSource` { `DCM::DeviceControl::EcmId`, `DCM::DeviceControl::EcmPidSourceAuto` }  
*ECM pid source.*
- enum `DCM::DeviceControl::eEcmgChannelIdMode` { `DCM::DeviceControl::EcmgChannelIdManual`, `DCM::DeviceControl::EcmgChannelIdAuto` }  
*ECMG channel\_id allocation.*
- enum `DCM::DeviceControl::eEcmgConnectionStatus` { `DCM::DeviceControl::EcmgClosed`, `DCM::DeviceControl::EcmgTryingToConnect`, `DCM::DeviceControl::EcmgEstablishingChannel`, `DCM::DeviceControl::EcmgChannelOpen` }  
*ECMG connection status.*
- enum `DCM::DeviceControl::eEcmgDescRuleType` { `DCM::DeviceControl::EcmgAddPrivateData`, `DCM::DeviceControl::EcmgDoNotInsertDescriptor` }  
*Type of ECMG descriptor rule.*
- enum `DCM::DeviceControl::eDescInsertionLevel` { `DCM::DeviceControl::FollowScg`, `DCM::DeviceControl::InsertAtESLevel` }  
*Insertion level of ECMG descriptor in PMT.*

- enum `DCM::DeviceControl::eDescInsertionLevel_V2` { `DCM::DeviceControl::FollowScg_V2`, `DCM::DeviceControl::InsertAtESLevel_V2`, `DCM::DeviceControl::InsertAtServiceLevel_V2`, `DCM::DeviceControl::eDescInsertionLevel_V2_Reserved4`, `DCM::DeviceControl::eDescInsertionLevel_V2_Reserved5`, `DCM::DeviceControl::eDescInsertionLevel_V2_Reserved6` }  
*Insertion level of ECMG descriptor in PMT.*
- enum `DCM::DeviceControl::eDataSocket` { `DCM::DeviceControl::TCP`, `DCM::DeviceControl::UDP` }  
*Type of data for socket.*
- enum `DCM::DeviceControl::eEmmPidSource` { `DCM::DeviceControl::StreamId`, `DCM::DeviceControl::ChannelId`, `DCM::DeviceControl::DataId`, `DCM::DeviceControl::PacketId`, `DCM::DeviceControl::EmmPidSourceAuto` }  
*EMM pid source.*
- enum `DCM::DeviceControl::eEmmSectionGrouping` { `DCM::DeviceControl::NoGrouping`, `DCM::DeviceControl::Grouping` }  
*Enable/disable section grouping for EMM's.*
- enum `DCM::DeviceControl::eConnectionState` { `DCM::DeviceControl::EmmWaitingForConnect`, `DCM::DeviceControl::EmmWaitingForChannel`, `DCM::DeviceControl::EmmChannelOpen` }
- enum `DCM::DeviceControl::eEmmgDescRuleType` { `DCM::DeviceControl::EmmgAddPrivateData`, `DCM::DeviceControl::EmmgDoNotInsertDescriptor` }  
*Type of EMMG descriptor rule.*
- enum `DCM::DeviceControl::eEisType` { `DCM::DeviceControl::SaEis`, `DCM::DeviceControl::CaVendorEis` }  
*EIS type.*
- enum `DCM::DeviceControl::eCwgType` { `DCM::DeviceControl::CwgType_PowerVu`, `DCM::DeviceControl::CwgType_Reserved2`, `DCM::DeviceControl::CwgType_Reserved3` }  
*CWG proxy type.*
- enum `DCM::DeviceControl::eCwgChannelIdMode` { `DCM::DeviceControl::CwgChannelIdManual`, `DCM::DeviceControl::CwgChannelIdAuto` }  
*CWG channel\_id allocation.*
- enum `DCM::DeviceControl::eCwgConnectionStatus` { `DCM::DeviceControl::CwgClosed`, `DCM::DeviceControl::CwgTryingToConnect`, `DCM::DeviceControl::CwgEstablishingChannel`, `DCM::DeviceControl::CwgChannelOpen` }  
*CWG connection status.*

## Functions

- void `DCM::DeviceControl::IsScrambler` (out boolean `bScrambler`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Notifies the client whether it is a scrambler or not.*
- void `DCM::DeviceControl::SetDeviceAsBackup` (in boolean `bIsBackup`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)  
*Set the device (DCM) as backup device or not.*
- void `DCM::DeviceControl::SetScsSettings` (in boolean `ScrambleOnlyAV`, in boolean `CheckElementsAtProvisionTime`, in unsigned long `ScgAcceptDelay`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)  
*Set global SCS settings.*
- void `DCM::DeviceControl::GetScsSettings` (out boolean `ScrambleOnlyAV`, out boolean `CheckElementsAtProvisionTime`, out unsigned long `ScgAcceptDelay`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get global SCS settings.*

- void **DCM::DeviceControl::SetClearStrongPairingEnforceBit** (in boolean bClearStrongPairingEnforcementBit) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)

*Set strong pairing enforcement bit clear flag (NDS specific).*

- void **DCM::DeviceControl::GetClearStrongPairingEnforceBit** (out boolean bClearStrongPairingEnforcementBit) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get strong pairing enforcement bit clear flag (NDS specific).*

- void **DCM::DeviceControl::SetJclConfig** (in JclInitialValue\_t InitialValue, in JclSystemId\_t SystemId) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Set JCL configuration.*

- void **DCM::DeviceControl::GetJclConfig** (out JclInitialValue\_t InitialValue, out JclSystemId\_t SystemId) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get JCL configuration.*

- void **DCM::DeviceControl::GetInterfaceList** (out IdList EcmgIds, out IdList EmmgIds, out IdList EisIds, out IdList PsigIds, out IdList MCryptEisIds, out IdList MCryptPsigIds) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get list of configured proxies.*

- void **DCM::DeviceControl::GetInterfaceList\_V2** (out IdList EcmgIds, out IdList EmmgIds, out IdList EisIds, out IdList PsigIds, out IdList CwgIds) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get list of configured proxies.*

- void **DCM::DeviceControl::CreateEcmg** (out unsigned long EcmgId) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Create an ECMG proxy.*

- void **DCM::DeviceControl::DeleteEcmg** (in unsigned long EcmgId) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

*Delete an ECMG proxy.*

- void **DCM::DeviceControl::SetEcmgConfig** (in unsigned long EcmgId, in string Name, in eEcmgType EcmgType, in unsigned short CasId, in unsigned short SubCasId, in eEcmPidSource EcmPidSource, in unsigned short EcmPidLowerLimit, in unsigned short EcmPidUpperLimit, in eEcmgChannelIdMode EcmgChannelIdMode) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

*Set ECMG proxy configuration settings.*

- void **DCM::DeviceControl::GetEcmgConfig** (in unsigned long EcmgId, out string Name, out eEcmgType EcmgType, out unsigned short CasId, out unsigned short SubCasId, out eEcmPidSource EcmPidSource, out unsigned short EcmPidLowerLimit, out unsigned short EcmPidUpperLimit, out eEcmgChannelIdMode EcmgChannelIdMode) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Get ECMG proxy configuration settings.*

- void **DCM::DeviceControl::SetEcmgConfig\_V2** (in unsigned long EcmgId, in string Name, in eEcmgType\_V2 EcmgType, in unsigned short CasId, in unsigned short SubCasId, in eEcmPidSource EcmPidSource, in unsigned short EcmPidLowerLimit, in unsigned short EcmPidUpperLimit, in eEcmgChannelIdMode EcmgChannelIdMode) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

*Set ECMG proxy configuration settings.*

- void **DCM::DeviceControl::GetEcmgConfig\_V2** (in unsigned long EcmgId, out string Name, out eEcmgType\_V2 EcmgType, out unsigned short CasId, out unsigned short SubCasId, out eEcmPidSource EcmPidSource, out unsigned short EcmPidLowerLimit, out unsigned short EcmPidUpperLimit, out eEcmgChannelIdMode EcmgChannelIdMode) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Get ECMG proxy configuration settings.*

- void [DCM::DeviceControl::SetEcmgBackup](#) (in unsigned long EcmgId, in boolean BackupRevertive, in long RevertTime, in boolean HotStandby) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

*Set ECMG backup settings (obsolete!).*

- void [DCM::DeviceControl::GetEcmgBackup](#) (in unsigned long EcmgId, out boolean BackupRevertive, out long RevertTime, out boolean HotStandby) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Get ECMG backup settings (obsolete!).*

- void [DCM::DeviceControl::RevertNow](#) (in unsigned long EcmgId) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

???

- void [DCM::DeviceControl::GetEcmgStatus](#) (in unsigned long EcmgId, out unsigned long NoOfRequestedStreams, out unsigned long NoOfOpenStreams) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Get status of ECMG proxy.*

- void [DCM::DeviceControl::GetConnList](#) (in unsigned long EcmgId, out IdList ConnIds) raises (-Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Get list of available connections (channels) for an ECMG proxy.*

- void [DCM::DeviceControl::GetEcmgConnList](#) (in unsigned long EcmgId, out IdList ConnIds) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Get list of available connections (channels) for an ECMG proxy.*

- void [DCM::DeviceControl::CreateEcmgConn](#) (in unsigned long EcmgId, out unsigned long ConnId) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Create a new connection (channel) for an ECMG proxy.*

- void [DCM::DeviceControl::DeleteEcmgConn](#) (in unsigned long EcmgId, in unsigned long ConnId) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Delete a connection (channel) for an ECMG proxy.*

- void [DCM::DeviceControl::SetEcmgConnConfig](#) (in unsigned long EcmgId, in unsigned long ConnId, in unsigned long IpAddress, in unsigned short Port, in unsigned short ChannelId, in long -Priority) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

*Set connection (channel) configuration settings.*

- void [DCM::DeviceControl::GetEcmgConnConfig](#) (in unsigned long EcmgId, in unsigned long -ConnId, out unsigned long IpAddress, out unsigned short Port, out unsigned short ChannelId, out long Priority) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

*Get connection (channel) configuration settings.*

- void [DCM::DeviceControl::SetEcmgConnConfig\\_V2](#) (in unsigned long EcmgId, in unsigned long ConnId, in string IPAddress, in unsigned short Port, in unsigned short ChannelId, in long Priority) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

*Set connection (channel) configuration settings.*

- void [DCM::DeviceControl::GetEcmgConnConfig\\_V2](#) (in unsigned long EcmgId, in unsigned long ConnId, out string IPAddress, out unsigned short Port, out unsigned short ChannelId, out long -Priority) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Get connection (channel) configuration settings.*

- void [DCM::DeviceControl::GetEcmgConnStatus](#) (in unsigned long EcmgId, in unsigned long ConnId, out eEcmgConnectionStatus EcmgConnectionStatus, out unsigned short UsedChannelId, out unsigned short NoOfOpenStreams) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Get status of connection (channel) in ECMG proxy.*

- void [DCM::DeviceControl::SetEcmgOverride](#) (in unsigned long EcmgId, in boolean OverrideMaxCompTime, in short MaxCompTime, in boolean OverrideMinimumCPDuration, in unsigned long MinimumCPDuration, in boolean OverrideTransitionStartDelay, in short TransitionStartDelay, in boolean OverrideTransitionStopDelay, in short TransitionStopDelay, in boolean OverrideStartDelay, in short StartDelay, in boolean OverrideStopDelay, in short StopDelay, in boolean OverrideAcStartDelay, in short AcStartDelay, in boolean OverrideAcStopDelay, in short AcStopDelay) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

*Set ECMG proxy advanced settings (part 1).*

- void [DCM::DeviceControl::GetEcmgOverride](#) (in unsigned long EcmgId, out boolean OverrideMaxCompTime, out short MaxCompTime, out boolean OverrideMinimumCPDuration, out unsigned long MinimumCPDuration, out boolean OverrideTransitionStartDelay, out short TransitionStartDelay, out boolean OverrideTransitionStopDelay, out short TransitionStopDelay, out boolean OverrideStartDelay, out short StartDelay, out boolean OverrideStopDelay, out short StopDelay, out boolean OverrideAcStartDelay, out short AcStartDelay, out boolean OverrideAcStopDelay, out short AcStopDelay) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Get ECMG proxy advanced settings (part 1).*

- void [DCM::DeviceControl::SetEcmgOverrideExt](#) (in unsigned long EcmgId, in boolean OverrideMaxStreams, in unsigned short MaxStreams, in boolean OverrideEcmRepPeriod, in unsigned short EcmRepPeriod) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

*Set ECMG proxy advanced settings (part 2).*

- void [DCM::DeviceControl::GetEcmgOverrideExt](#) (in unsigned long EcmgId, out boolean OverrideMaxStreams, out unsigned short MaxStreams, out boolean OverrideEcmRepPeriod, out unsigned short EcmRepPeriod) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Get ECMG proxy advanced settings (part 2).*

- void [DCM::DeviceControl::GetEcmgDescList](#) (in unsigned long EcmgId, out IdList DescRuleIds) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Get list of available descriptor rules for ECMG proxy.*

- void [DCM::DeviceControl::CreateEcmgDescriptor](#) (in unsigned long EcmgId, out unsigned long DescRuleId) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Create a new descriptor rule for an ECMG proxy.*

- void [DCM::DeviceControl::DeleteEcmgDescriptor](#) (in unsigned long EcmgId, in unsigned long DescRuleId) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Delete a descriptor rule for an ECMG proxy.*

- void [DCM::DeviceControl::SetEcmgDescriptor](#) (in unsigned long EcmgId, in unsigned long DescRuleId, in string DescRuleName, in eEcmgDescRuleType Type, in eDescInsertionLevel InsertionLevel, in string DescriptorData, in EcmIdList EcmIds) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

*Set descriptor rule (on ECMG proxy) configuration settings.*

- void [DCM::DeviceControl::GetEcmgDescriptor](#) (in unsigned long EcmgId, in unsigned long DescRuleId, out string DescRuleName, out eEcmgDescRuleType Type, out eDescInsertionLevel InsertionLevel, out string DescriptorData, out EcmIdList EcmIds) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Get descriptor rule (on ECMG proxy) configuration settings.*

- void [DCM::DeviceControl::SetEcmgDescriptor\\_V2](#) (in unsigned long EcmgId, in unsigned long - DescRuleId, in string DescRuleName, in eEcmgDescRuleType Type, in eDescInsertionLevel\_V2 InsertionLevel, in string DescriptorData, in EcmIdList EcmIds) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

*Set descriptor rule (on ECMG proxy) configuration settings.*

- void [DCM::DeviceControl::GetEcmgDescriptor\\_V2](#) (in unsigned long EcmgId, in unsigned long DescRuleId, out string DescRuleName, out eEcmgDescRuleType Type, out eDescInsertionLevel\_V2 InsertionLevel, out string DescriptorData, out EcmIdList EcmIds) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Get descriptor rule (on ECMG proxy) configuration settings.*

- void [DCM::DeviceControl::SetHotEcmgConnection](#) (in unsigned long EcmgId, in boolean bBackup-HotStandby) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

*Set ECMG hot connection backup setting(override ECMG disconnection).*

- void [DCM::DeviceControl::GetHotEcmgConnection](#) (in unsigned long EcmgId, out boolean bBackup-HotStandby) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Get ECMG hot connection backup setting(override ECMG disconnection).*

- void [DCM::DeviceControl::SetEcmgNotifyCPEExtension](#) (in unsigned long EcmgId, in boolean - NotifyCPEExtension) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

*Set ECMG notify CP extension.*

- void [DCM::DeviceControl::GetEcmgNotifyCPEExtension](#) (in unsigned long EcmgId, out boolean - NotifyCPEExtension) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Get ECMG notify CP extension.*

- void [DCM::DeviceControl::CreateEmmg](#) (out unsigned long EmmgId) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Create an EMMG proxy.*

- void [DCM::DeviceControl::DeleteEmmg](#) (in unsigned long EmmgId) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Delete an EMMG proxy.*

- void [DCM::DeviceControl::SetEmmgConfig](#) (in unsigned long EmmgId, in string Name, in long ClientId, in eDataSocket DataSocket, in unsigned short TcpPort, in unsigned short UdpPort, in unsigned long MaxBandwidth, in eEmmPidSource EmmmPidSource, in unsigned short EmmmPidLowerLimit, in unsigned short EmmmPidUpperLimit, in eEmmSectionGrouping SectionGrouping) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

*Set EMMG proxy configuration settings.*

- void [DCM::DeviceControl::GetEmmgConfig](#) (in unsigned long EmmgId, out string Name, out long ClientId, out eDataSocket DataSocket, out unsigned short TcpPort, out unsigned short UdpPort, out unsigned long MaxBandwidth, out eEmmPidSource EmmmPidSource, out unsigned short EmmmPidLowerLimit, out unsigned short EmmmPidUpperLimit, out eEmmSectionGrouping SectionGrouping) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Get EMMG proxy configuration settings.*

- void [DCM::DeviceControl::GetEmmgStatus](#) (in unsigned long EmmgId, out eConnectionState - EmmgConnectionState, out unsigned long NoOfOpenStreams, out unsigned long CurrentBandwidth, out unsigned long ConnectionPeer) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

*Get status of EMMG proxy.*

- void [DCM::DeviceControl::GetEmmgStatus\\_V2](#) (in unsigned long EmmgId, out eConnectionState - EmmgConnectionState, out unsigned long NoOfOpenStreams, out unsigned long CurrentBandwidth, out string ConnectionPeer) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Get status of EMMG proxy.*

- void [DCM::DeviceControl::GetEmmgDescList](#) (in unsigned long EmmgId, out IdList DescRuleIds) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Get list of available descriptor rules for EMMG proxy.*

- void [DCM::DeviceControl::CreateEmmgDescriptor](#) (in unsigned long EmmgId, out unsigned long - DescRuleId) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Create a new descriptor rule for an EMMG proxy.*

- void [DCM::DeviceControl::DeleteEmmgDescriptor](#) (in unsigned long EmmgId, in unsigned long - DescRuleId) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Delete a descriptor rule for an EMMG proxy.*

- void [DCM::DeviceControl::SetEmmgDescriptor](#) (in unsigned long EmmgId, in unsigned long DescRuleId, in string DescRuleName, in eEmmgDescRuleType Type, in string DescriptorData, in - DataIdList DataIds) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

*Set descriptor rule (on EMMG proxy) configuration settings.*

*Set PSIG proxy configuration settings.*

- void [DCM::DeviceControl::GetPsigConfig3](#) (in unsigned long PsigId, out string Name, out ePsigType PsigType, out unsigned short TcpPort, out unsigned long MaxBandwidth, out boolean DoNotModify, out boolean MultipleNITa) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Get PSIG proxy configuration settings.*

- void [DCM::DeviceControl::GetPsigStatus](#) (in unsigned long PsigId, out eConnectionState PsigConnectionState, out unsigned long NoOfStreams, out unsigned long CurrentBandwidth, out unsigned long -ConnectionPeer) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

*Get status of PSIG proxy.*

- void [DCM::DeviceControl::GetPsigStatus\\_V2](#) (in unsigned long PsigId, out eConnectionState Psig-ConnectionState, out unsigned long NoOfStreams, out unsigned long CurrentBandwidth, out string -ConnectionPeer) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Get status of PSIG proxy.*

- void [DCM::DeviceControl::CreateCwg](#) (out unsigned long CwgId) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Create an CWG proxy.*

- void [DCM::DeviceControl::DeleteCwg](#) (in unsigned long CwgId) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

*Delete an CWG proxy.*

- void [DCM::DeviceControl::SetCwgConfig](#) (in unsigned long CwgId, in string Name, in eCwgType Type, in unsigned short CasId, in unsigned short SubCasId, in eCwgChannelIdMode ChannelId-Mode) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, Out-OfRange)

*Set CWG proxy configuration settings.*

- void [DCM::DeviceControl::GetCwgConfig](#) (in unsigned long CwgId, out string Name, out eCwg-Type Type, out unsigned short CasId, out unsigned short SubCasId, out eCwgChannelIdMode -ChannelIdMode) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Get CWG proxy configuration settings.*

- void [DCM::DeviceControl::GetCwgStatus](#) (in unsigned long CwgId, out unsigned long NoOfRequested-Streams, out unsigned long NoOfOpenStreams) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Get status of CWG proxy.*

- void [DCM::DeviceControl::GetCwgConnList](#) (in unsigned long CwgId, out IdList ConnIds) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Get list of available connections (channels) for an CWG proxy.*

- void [DCM::DeviceControl::CreateCwgConn](#) (in unsigned long CwgId, out unsigned long ConnId) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Create a new connection (channel) for an CWG proxy.*

- void [DCM::DeviceControl::DeleteCwgConn](#) (in unsigned long CwgId, in unsigned long ConnId) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Delete a connection (channel) for an CWG proxy.*

- void [DCM::DeviceControl::SetCwgConnConfig](#) (in unsigned long CwgId, in unsigned long Conn-Id, in unsigned long IpAddress, in unsigned short Port, in unsigned short ChannelId, in long -Priority) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

*Set connection (channel) configuration settings.*

- void [DCM::DeviceControl::GetCwgConnConfig](#) (in unsigned long CwgId, in unsigned long Conn-Id, out unsigned long IpAddress, out unsigned short Port, out unsigned short ChannelId, out long Priority) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

*Get connection (channel) configuration settings.*

- void [DCM::DeviceControl::SetCwgConnConfig\\_V2](#) (in unsigned long CwgId, in unsigned long -ConnId, in string IpAddress, in unsigned short Port, in unsigned short ChannelId, in long Priority) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

*Set connection (channel) configuration settings.*

- void [DCM::DeviceControl::GetCwgConnConfig\\_V2](#) (in unsigned long CwgId, in unsigned long ConnId, out string IpAddress, out unsigned short Port, out unsigned short ChannelId, out long Priority) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Get connection (channel) configuration settings.*

- void [DCM::DeviceControl::GetCwgConnStatus](#) (in unsigned long CwgId, in unsigned long ConnId, out eCwgConnectionStatus ConnectionStatus, out unsigned short UsedChannelId, out unsigned short NoOfOpenStreams) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Get status of connection (channel) in CWG proxy.*

- void [DCM::DeviceControl::SetCwgOvrerrule](#) (in unsigned long CwgId, in boolean OvrerruleMaxCompTime, in short MaxCompTime, in boolean OvrerruleMaxStreams, in unsigned short MaxStreams) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

*Set CWG proxy advanced settings.*

- void [DCM::DeviceControl::GetCwgOvrerrule](#) (in unsigned long CwgId, out boolean OvrerruleMaxCompTime, out short MaxCompTime, out boolean OvrerruleMaxStreams, out unsigned short MaxStreams) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

*Get CWG proxy advanced settings.*

### 8.62.1 Detailed Description

This module contains types, enums and methods related to the scrambler.

### 8.62.2 Typedef Documentation

#### 8.62.2.1 typedef sequence<unsigned short> DCM::DeviceControl::DataIdList

list of DataId's

Definition at line 24855 of file DCM.idl.

#### 8.62.2.2 typedef sequence<unsigned short> DCM::DeviceControl::EcmIdList

list of EcmId's

Definition at line 24807 of file DCM.idl.

#### 8.62.2.3 typedef sequence<unsigned long> DCM::DeviceControl::IdList

list of ID's (for several purposes)

Definition at line 24714 of file DCM.idl.

### 8.62.3 Enumeration Type Documentation

#### 8.62.3.1 enum DCM::DeviceControl::eConnectionState

Enumerator:

*EmmWaitingForConnect* trying socket connect

*EmmWaitingForChannel* socket OK, trying channel connect

*EmmChannelOpen* channel OK

Definition at line 24841 of file DCM.idl.

**8.62.3.2 enum DCM::DeviceControl::eCwgChannelIdMode**

CWG channel\_id allocation.

**Version**

release 9.0

**Enumerator:**

*CwgChannelIdManual* use manual configured channel\_id  
*CwgChannelIdAuto* automatic allocate channel\_id (default value)

Definition at line 24900 of file DCM.idl.

**8.62.3.3 enum DCM::DeviceControl::eCwgConnectionStatus**

CWG connection status.

**Version**

release 9.0

**Enumerator:**

*CwgClosed* backup channel in cold standby  
*CwgTryingToConnect* hot standby, trying socket connect  
*CwgEstablishingChannel* socket ok, trying channel connect  
*CwgChannelOpen* channel ok

Definition at line 24911 of file DCM.idl.

**8.62.3.4 enum DCM::DeviceControl::eCwgType**

CWG proxy type.

**Version**

release 9.0

**Enumerator:**

*CwgType\_PowerVu* PowerVu CWG.  
*CwgType\_Reserved2*  
*CwgType\_Reserved3*

Definition at line 24888 of file DCM.idl.

**8.62.3.5 enum DCM::DeviceControl::eDataSocket**

Type of data for socket.

**Enumerator:**

*TCP* TCP protocol (default value)  
*UDP* UDP protocol.

Definition at line 24814 of file DCM.idl.

**8.62.3.6 enum DCM::DeviceControl::eDescInsertionLevel**

Insertion level of ECMG descriptor in PMT.

Enumerator:

*FollowScg* insert according SCG (default value)

*InsertAtESLevel* insert at ES level

Definition at line 24780 of file DCM.idl.

**8.62.3.7 enum DCM::DeviceControl::eDescInsertionLevel\_V2**

Insertion level of ECMG descriptor in PMT.

Version

release 8.1

Enumerator:

*FollowScg\_V2* insert according SCG (default value)

*InsertAtESLevel\_V2* insert at ES level

*InsertAtServiceLevel\_V2* insert at service level

*eDescInsertionLevel\_V2\_Reserved4* Reserved for future use.

*eDescInsertionLevel\_V2\_Reserved5* Reserved for future use.

*eDescInsertionLevel\_V2\_Reserved6* Reserved for future use.

Definition at line 24794 of file DCM.idl.

**8.62.3.8 enum DCM::DeviceControl::eEcmgChannelIdMode**

ECMG channel\_id allocation.

Enumerator:

*EcmgChannelIdManual* use manual configured channel\_id

*EcmgChannelIdAuto* automatic allocate channel\_id (default value)

Definition at line 24757 of file DCM.idl.

**8.62.3.9 enum DCM::DeviceControl::eEcmgConnectionStatus**

ECMG connection status.

Enumerator:

*EcmgClosed* backup channel in cold standby

*EcmgTryingToConnect* hot standby, trying socket connect

*EcmgEstablishingChannel* socket ok, trying channel connect

*EcmgChannelOpen* channel ok

Definition at line 24764 of file DCM.idl.

**8.62.3.10 enum DCM::DeviceControl::eEcmgDescRuleType**

Type of ECMG descriptor rule.

Enumerator:

*EcmgAddPrivateData* add private data to descriptor (default value)

*EcmgDoNotInsertDescriptor* do not insert descriptor (in PSIG imported table)

Definition at line 24773 of file DCM.idl.

**8.62.3.11 enum DCM::DeviceControl::eEcmgType**

ECMG type.

Enumerator:

*EcmgStandard* (default value)

*M\_Crypt* creates streams even if no ECMs are requested < overrules AC with fixed format: ON\_ID, TS\_ID, SID

*Nagra* overrules AC with fixed format: ECM\_ID

*Hitachi*

Definition at line 24721 of file DCM.idl.

**8.62.3.12 enum DCM::DeviceControl::eEcmgType\_V2**

ECMG type.

Version

release 8.9

Enumerator:

*EcmgType\_Standard* (default value)

*EcmgType\_M\_Crypt* creates streams even if no ECMs are requested < overrules AC with fixed format: ON\_ID, TS\_ID, SID

*EcmgType\_Nagra* overrules AC with fixed format: ECM\_ID

*EcmgType\_Hitachi*

*EcmgType\_PowerVu* PowerVu specific scrambling (external CWG...)

*EcmgType\_Reserved5* PowerKEY specific scrambling (add hint bit)

*EcmgType\_Reserved6* Reserved for future use.

*EcmgType\_Reserved7* Reserved for future use.

*EcmgType\_Reserved8* Reserved for future use.

Definition at line 24735 of file DCM.idl.

**8.62.3.13 enum DCM::DeviceControl::eEcmPidSource**

ECM pid source.

Enumerator:

- EcmId* use EcmId as pid for ECM
- EcmPidSourceAuto* automatic allocate pid for ECM (default value)

Definition at line 24750 of file DCM.idl.

**8.62.3.14 enum DCM::DeviceControl::eEisType**

EIS type.

Enumerator:

- SaEis* SA specific EIS (= ROSA SCTask) (default value)
- CaVendorEis* external CA vendor EIS

Definition at line 24862 of file DCM.idl.

**8.62.3.15 enum DCM::DeviceControl::eEmmgDescRuleType**

Type of EMMG descriptor rule.

Enumerator:

- EmmgAddPrivateData* add private data to descriptor (default value)
- EmmgDoNotInsertDescriptor* do not insert descriptor (in PSIG imported table?)

Definition at line 24849 of file DCM.idl.

**8.62.3.16 enum DCM::DeviceControl::eEmmPidSource**

EMM pid source.

Enumerator:

- StreamId* use StreamId as pid for EMM
- ChannelId* use ChannelId as pid for EMM
- DataId* use DataId as pid for EMM
- PacketId* use PacketId as pid for EMM
- EmmPidSourceAuto* automatic allocate pid for EMM (default value)

Definition at line 24821 of file DCM.idl.

**8.62.3.17 enum DCM::DeviceControl::eEmmSectionGrouping**

Enable/disable section grouping for EMM's.

Enumerator:

- NoGrouping* disable section grouping for EMM's
- Grouping* enable section grouping for EMM's

Definition at line 24833 of file DCM.idl.

## 8.62.4 Function Documentation

**8.62.4.1** void DCM::DeviceControl::CreateCwg ( out unsigned long *CwgId* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Create an CWG proxy.

## Parameters

|     |              |                                     |
|-----|--------------|-------------------------------------|
| out | <i>CwgId</i> | proxy_id of newly created CWG proxy |
|-----|--------------|-------------------------------------|

## Exceptions

|                         |                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i>   | internal error only                                                                                      |
| <i>InvalidSelection</i> | when out of proxy_id's                                                                                   |
| <i>OpNotAllowed</i>     | not logged on                                                                                            |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or when call not yet supported on running software version |

## Version

release 9.0

**8.62.4.2** void DCM::DeviceControl::CreateCwgConn ( in unsigned long *CwgId*, out unsigned long *ConnId* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Create a new connection (channel) for an CWG proxy.

## Parameters

|     |               |                                               |
|-----|---------------|-----------------------------------------------|
| in  | <i>CwgId</i>  | proxy_id (range [0, 40[) of CWG proxy         |
| out | <i>ConnId</i> | conn_id of newly created connection (channel) |

## Exceptions

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                      |
| <i>OpNotSucceeded</i>   | internal error only                                                                            |
| <i>InvalidSelection</i> | invalid CwgId                                                                                  |
| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |

## Version

release 9.0

**8.62.4.3** void DCM::DeviceControl::CreateEcmg ( out unsigned long *EcmgId* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Create an ECMG proxy.

**Parameters**

|     |               |                                      |
|-----|---------------|--------------------------------------|
| out | <i>EcmgId</i> | proxy_id of newly created ECMG proxy |
|-----|---------------|--------------------------------------|

**Exceptions**

|                         |                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i>   | internal error only                                                                                      |
| <i>InvalidSelection</i> | when out of proxy_id's                                                                                   |
| <i>OpNotAllowed</i>     | not logged on                                                                                            |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or when call not yet supported on running software version |

**Version**

release 2.0

**8.62.4.4** void DCM::DeviceControl::CreateEcmgConn ( in unsigned long *EcmgId*, out unsigned long *ConnId* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Create a new connection (channel) for an ECMG proxy.

**Parameters**

|     |               |                                               |
|-----|---------------|-----------------------------------------------|
| in  | <i>EcmgId</i> | proxy_id (range [0, 40]) of ECMG proxy        |
| out | <i>ConnId</i> | conn_id of newly created connection (channel) |

**Exceptions**

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                      |
| <i>OpNotSucceeded</i>   | internal error only                                                                            |
| <i>InvalidSelection</i> | invalid EcmgId                                                                                 |
| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |

**Version**

release 2.0

**8.62.4.5** void DCM::DeviceControl::CreateEcmgDescriptor ( in unsigned long *EcmgId*, out unsigned long *DescRuleId* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Create a new descriptor rule for an ECMG proxy.

**Parameters**

|     |                   |                                               |
|-----|-------------------|-----------------------------------------------|
| in  | <i>EcmgId</i>     | proxy_id (range [0, 40]) of ECMG proxy        |
| out | <i>DescRuleId</i> | desc_rule_id of newly created descriptor rule |

**Exceptions**

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                      |
| <i>OpNotSucceeded</i>   | internal error only                                                                            |
| <i>InvalidSelection</i> | invalid EcmgId                                                                                 |
| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |

**Version**

release 2.0

**8.62.4.6** void DCM::DeviceControl::CreateEis ( out unsigned long *EisId* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Create an EIS proxy.

**Parameters**

|     |              |                                                     |
|-----|--------------|-----------------------------------------------------|
| out | <i>EisId</i> | proxy_id (range [0, 40[) of newly created EIS proxy |
|-----|--------------|-----------------------------------------------------|

**Exceptions**

|                         |                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i>   | internal error only                                                                                      |
| <i>InvalidSelection</i> | when out of proxy_id's                                                                                   |
| <i>OpNotAllowed</i>     | not logged on                                                                                            |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or when call not yet supported on running software version |

**Version**

release 2.0

**8.62.4.7** void DCM::DeviceControl::CreateEmmg ( out unsigned long *EmmgId* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Create an EMMG proxy.

**Parameters**

|     |               |                                      |
|-----|---------------|--------------------------------------|
| out | <i>EmmgId</i> | proxy_id of newly created EMMG proxy |
|-----|---------------|--------------------------------------|

**Exceptions**

|                         |                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i>   | internal error only                                                                                      |
| <i>InvalidSelection</i> | when out of proxy_id's                                                                                   |
| <i>OpNotAllowed</i>     | not logged on                                                                                            |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or when call not yet supported on running software version |

**Version**

release 2.0

**8.62.4.8** void DCM::DeviceControl::CreateEmmgDescriptor ( in unsigned long *EmmgId*, out unsigned long *DescRuleId* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Create a new descriptor rule for an EMMG proxy.

**Parameters**

|     |                   |                                               |
|-----|-------------------|-----------------------------------------------|
| in  | <i>EmmgId</i>     | proxy_id (range [0, 40[) of EMMG proxy        |
| out | <i>DescRuleId</i> | desc_rule_id of newly created descriptor rule |

**Exceptions**

|                         |                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i>   | internal error only                                                                                      |
| <i>InvalidSelection</i> | invalid EmmgId                                                                                           |
| <i>OpNotAllowed</i>     | not logged on                                                                                            |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or when call not yet supported on running software version |

**Version**

release 2.0

**8.62.4.9** void DCM::DeviceControl::CreateMCryptEis ( out unsigned long *EisId* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Create a MCrypt EIS proxy.

**Parameters**

|     |              |                                                            |
|-----|--------------|------------------------------------------------------------|
| out | <i>EisId</i> | proxy_id (range [0, 40[) of newly created MCrypt EIS proxy |
|-----|--------------|------------------------------------------------------------|

**Exceptions**

|                         |                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i>   | internal error only                                                                                      |
| <i>InvalidSelection</i> | when out of proxy_id's                                                                                   |
| <i>OpNotAllowed</i>     | not logged on                                                                                            |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or when call not yet supported on running software version |

**Version**

release 2.0

**Deprecated** This call should not be used (replace by call CreateEis)

**8.62.4.10** void DCM::DeviceControl::CreateMCryptPsig ( out unsigned long *PsigId* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Create a MCrypt PSIG proxy.

#### Parameters

|     |               |                                                             |
|-----|---------------|-------------------------------------------------------------|
| out | <i>PsigId</i> | proxy_id (range [0, 40]) of newly created MCrypt PSIG proxy |
|-----|---------------|-------------------------------------------------------------|

#### Exceptions

|                         |                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i>   | internal error only                                                                                      |
| <i>InvalidSelection</i> | when out of proxy_id's                                                                                   |
| <i>OpNotAllowed</i>     | not logged on                                                                                            |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or when call not yet supported on running software version |

#### Version

release 2.0

**Deprecated** This call should not be used (replace by call CreatePsig)

**8.62.4.11** void DCM::DeviceControl::CreatePsig ( out unsigned long *PsigId* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Create a PSIG proxy.

#### Parameters

|     |               |                                                      |
|-----|---------------|------------------------------------------------------|
| out | <i>PsigId</i> | proxy_id (range [0, 40]) of newly created PSIG proxy |
|-----|---------------|------------------------------------------------------|

#### Exceptions

|                         |                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i>   | internal error only                                                                                      |
| <i>InvalidSelection</i> | when out of proxy_id's                                                                                   |
| <i>OpNotAllowed</i>     | not logged on                                                                                            |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or when call not yet supported on running software version |

#### Version

release 2.0

**8.62.4.12** void DCM::DeviceControl::DeleteCwg ( in unsigned long *CwgId* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

Delete an CWG proxy.

**Parameters**

|    |              |                                                 |
|----|--------------|-------------------------------------------------|
| in | <i>CwgId</i> | proxy_id (range [0, 40]) of CWG proxy to delete |
|----|--------------|-------------------------------------------------|

**Exceptions**

|                         |                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i>   | internal error only                                                                                      |
| <i>InvalidSelection</i> | invalid CwgId                                                                                            |
| <i>OpNotAllowed</i>     | not logged on                                                                                            |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or when call not yet supported on running software version |

**Version**

release 9.0

**8.62.4.13** void DCM::DeviceControl::DeleteCwgConn ( in unsigned long *CwgId*, in unsigned long *ConnId* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Delete a connection (channel) for an CWG proxy.

**Parameters**

|    |               |                                           |
|----|---------------|-------------------------------------------|
| in | <i>CwgId</i>  | proxy_id (range [0, 40]) of CWG proxy     |
| in | <i>ConnId</i> | conn_id of connection (channel) to delete |

**Exceptions**

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                      |

| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |

**Version**

release 9.0

**8.62.4.14** void DCM::DeviceControl::DeleteEcmg ( in unsigned long *EcmgId* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

Delete an ECMG proxy.

**Parameters**

|    |               |                                                  |
|----|---------------|--------------------------------------------------|
| in | <i>EcmgId</i> | proxy_id (range [0, 40]) of ECMG proxy to delete |
|----|---------------|--------------------------------------------------|

**Exceptions**

|                         |                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i>   | internal error only                                                                                      |
| <i>InvalidSelection</i> | invalid EcmgId                                                                                           |
| <i>OpNotAllowed</i>     | not logged on                                                                                            |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or when call not yet supported on running software version |

**Version**

release 2.0

**8.62.4.15** void DCM::DeviceControl::DeleteEcmgConn ( in unsigned long *EcmgId*, in unsigned long *ConnId* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Delete a connection (channel) for an ECMG proxy.

**Parameters**

|    |               |                                           |
|----|---------------|-------------------------------------------|
| in | <i>EcmgId</i> | proxy_id (range [0, 40[) of ECMG proxy    |
| in | <i>ConnId</i> | conn_id of connection (channel) to delete |

**Exceptions**

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                      |
| <i>OpNotSucceeded</i>   | internal error only                                                                            |
| <i>InvalidSelection</i> | invalid EcmgId, ConnId                                                                         |
| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |

**Version**

release 2.0

**8.62.4.16** void DCM::DeviceControl::DeleteEcmgDescriptor ( in unsigned long *EcmgId*, in unsigned long *DescRuleId* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Delete a descriptor rule for an ECMG proxy.

**Parameters**

|    |                   |                                           |
|----|-------------------|-------------------------------------------|
| in | <i>EcmgId</i>     | proxy_id (range [0, 40[) of ECMG proxy    |
| in | <i>DescRuleId</i> | desc_rule_id of descriptor rule to delete |

**Exceptions**

|                         |                                           |
|-------------------------|-------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing |
| <i>OpNotSucceeded</i>   | internal error only                       |
| <i>InvalidSelection</i> | invalid EcmgId, DescRuleId                |

|                       |                                                                                                |
|-----------------------|------------------------------------------------------------------------------------------------|
| <i>OpNotAllowed</i>   | not logged on                                                                                  |
| <i>OpNotSupported</i> | when called on other board than the mainboard or not yet supported on running software version |

**Version**

release 2.0

**8.62.4.17** void DCM::DeviceControl::DeleteEis ( in unsigned long *EisId* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Delete an EIS proxy.

**Parameters**

|    |              |                                                 |
|----|--------------|-------------------------------------------------|
| in | <i>EisId</i> | proxy_id (range [0, 40[) of EIS proxy to delete |
|----|--------------|-------------------------------------------------|

**Exceptions**

|                         |                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i>   | internal error only                                                                                      |
| <i>InvalidSelection</i> | invalid EisId                                                                                            |
| <i>OpNotAllowed</i>     | not logged on                                                                                            |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or when call not yet supported on running software version |

**Version**

release 2.0

**8.62.4.18** void DCM::DeviceControl::DeleteEmmg ( in unsigned long *EmmgId* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Delete an EMMG proxy.

**Parameters**

|    |               |                                                  |
|----|---------------|--------------------------------------------------|
| in | <i>EmmgId</i> | proxy_id (range [0, 40[) of EMMG proxy to delete |
|----|---------------|--------------------------------------------------|

**Exceptions**

|                         |                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i>   | internal error only                                                                                      |

| <i>OpNotAllowed</i>     | not logged on                                                                                            |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or when call not yet supported on running software version |

**Version**

release 2.0

**8.62.4.19** void DCM::DeviceControl::DeleteEmmgDescriptor ( in unsigned long *EmmgId*, in unsigned long *DescRuleId* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Delete a descriptor rule for an EMMG proxy.

**Parameters**

|    |                   |                                           |
|----|-------------------|-------------------------------------------|
| in | <i>EmmgId</i>     | proxy_id (range [0, 40]) of EMMG proxy    |
| in | <i>DescRuleId</i> | desc_rule_id of descriptor rule to delete |

**Exceptions**

|                         |                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i>   | internal error only                                                                                      |
| <i>InvalidSelection</i> | invalid EmmgId, DescRuleId                                                                               |
| <i>OpNotAllowed</i>     | not logged on                                                                                            |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or when call not yet supported on running software version |

**Version**

release 2.0

**8.62.4.20** void DCM::DeviceControl::DeleteMCryptEis ( in unsigned long *EisId* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Delete a MCrypt EIS proxy.

**Parameters**

|    |              |                                                        |
|----|--------------|--------------------------------------------------------|
| in | <i>EisId</i> | proxy_id (range [0, 40]) of MCrypt EIS proxy to delete |
|----|--------------|--------------------------------------------------------|

**Exceptions**

|                         |                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i>   | internal error only                                                                                      |
| <i>InvalidSelection</i> | invalid EisId                                                                                            |
| <i>OpNotAllowed</i>     | not logged on                                                                                            |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or when call not yet supported on running software version |

**Version**

release 2.0

**Deprecated** This call should not be used (replace by call DeleteEis)

**8.62.4.21** void DCM::DeviceControl::DeleteMCryptPsig ( in unsigned long *PsigId* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Delete a MCrypt PSIG proxy.

#### Parameters

|    |               |                                                         |
|----|---------------|---------------------------------------------------------|
| in | <i>PsigId</i> | proxy_id (range [0, 40]) of MCrypt PSIG proxy to delete |
|----|---------------|---------------------------------------------------------|

#### Exceptions

|                         |                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i>   | internal error only                                                                                      |
| <i>InvalidSelection</i> | invalid EisId                                                                                            |
| <i>OpNotAllowed</i>     | not logged on                                                                                            |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or when call not yet supported on running software version |

#### Version

release 2.0

**Deprecated** This call should not be used (replace by call DeletePsig)

**8.62.4.22** void DCM::DeviceControl::DeletePsig ( in unsigned long *PsigId* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Delete a PSIG proxy.

#### Parameters

|    |               |                                                  |
|----|---------------|--------------------------------------------------|
| in | <i>PsigId</i> | proxy_id (range [0, 40]) of PSIG proxy to delete |
|----|---------------|--------------------------------------------------|

#### Exceptions

|                         |                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i>   | internal error only                                                                                      |
| <i>InvalidSelection</i> | invalid EisId                                                                                            |
| <i>OpNotAllowed</i>     | not logged on                                                                                            |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or when call not yet supported on running software version |

#### Version

release 2.0

**8.62.4.23** void DCM::DeviceControl::GetClearStrongPairingEnforceBit ( out boolean *bClearStrongPairingEnforcementBit* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get strong pairing enforcement bit clear flag (NDS specific).

**Parameters**

|     |                                            |                                            |
|-----|--------------------------------------------|--------------------------------------------|
| out | <i>bClearStrong-Pairing-EnforcementBit</i> | indicate whether to clear bit in CW or not |
|-----|--------------------------------------------|--------------------------------------------|

**Exceptions**

|                       |                                                                                                          |
|-----------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i> | internal error                                                                                           |
| <i>OpNotAllowed</i>   | not logged on                                                                                            |
| <i>OpNotSupported</i> | when called on other board than the mainboard or when call not yet supported on running software version |

**Version**

release 5.5

**8.62.4.24** void DCM::DeviceControl::GetConnList ( in unsigned long *EcmgId*, out IdList *ConnIds* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Get list of available connections (channels) for an ECMG proxy.

**Parameters**

|     |                |                                          |
|-----|----------------|------------------------------------------|
| in  | <i>EcmgId</i>  | proxy_id (range [0, 40]) of ECMG proxy   |
| out | <i>ConnIds</i> | list of configured connections (conn_id) |

**Exceptions**

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                      |
| <i>OpNotSucceeded</i>   | internal error only                                                                            |
| <i>InvalidSelection</i> | invalid EcmgId                                                                                 |
| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |

**Version**

release 2.0

**Deprecated** This call should not be used anymore since release 8.9 (replaced by call GetEcmgConnList)

**8.62.4.25** void DCM::DeviceControl::GetCwgConfig ( in unsigned long *CwgId*, out string *Name*, out eCwgType *Type*, out unsigned short *CasId*, out unsigned short *SubCasId*, out eCwgChannelIdMode *ChannelIdMode* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Get CWG proxy configuration settings.

**Parameters**

|     |                       |                                       |
|-----|-----------------------|---------------------------------------|
| in  | <i>CwgId</i>          | proxy_id (range [0, 40]) of CWG proxy |
| out | <i>Name</i>           | name of CWG proxy                     |
| out | <i>Type</i>           | type of CWG proxy                     |
| out | <i>CasId</i>          | CA_system_id of CWG                   |
| out | <i>SubCasId</i>       | CA_subsystem_id of CWG                |
| out | <i>ChannelId-Mode</i> | CWG channel_id selection mode         |

**Exceptions**

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                      |
| <i>OpNotSucceeded</i>   | internal error                                                                                 |
| <i>InvalidSelection</i> | invalid CwgId                                                                                  |
| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |

**Version**

release 9.0

**8.62.4.26** void DCM::DeviceControl::GetCwgConnConfig ( in unsigned long *CwgId*, in unsigned long *ConnId*, out unsigned long *IpAddress*, out unsigned short *Port*, out unsigned short *ChannelId*, out long *Priority* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

Get connection (channel) configuration settings.

**Parameters**

|     |                  |                                                        |
|-----|------------------|--------------------------------------------------------|
| in  | <i>CwgId</i>     | proxy_id (range [0, 40]) of CWG proxy                  |
| in  | <i>ConnId</i>    | conn_id of connection (channel)                        |
| out | <i>IpAddress</i> | IP address of CWG to connect with                      |
| out | <i>Port</i>      | port on CWG to establish connection on                 |
| out | <i>ChannelId</i> | channel_id to be used (for manual mode)                |
| out | <i>Priority</i>  | priority of connection (for backup and load balancing) |

**Exceptions**

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                      |
| <i>OpNotSucceeded</i>   | internal error only                                                                            |
| <i>InvalidSelection</i> | invalid CwgId, ConnId                                                                          |
| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |
| <i>OutOfRange</i>       | when parameters invalid (e.g. IPv6 address configured)                                         |

**Version**

release 9.0

**Deprecated** This call should not be used anymore since release 10.10 (replaced by call GetCwgConnConfig\_V2)

**8.62.4.27** void DCM::DeviceControl::GetCwgConnConfig\_V2 ( in unsigned long *CwgId*, in unsigned long *ConnId*, out string *IpAddress*, out unsigned short *Port*, out unsigned short *ChannelId*, out long *Priority* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Get connection (channel) configuration settings.

#### Parameters

|     |                  |                                                        |
|-----|------------------|--------------------------------------------------------|
| in  | <i>CwgId</i>     | proxy_id (range [0, 40]) of CWG proxy                  |
| in  | <i>ConnId</i>    | conn_id of connection (channel)                        |
| out | <i>IpAddress</i> | IP address of CWG to connect with                      |
| out | <i>Port</i>      | port on CWG to establish connection on                 |
| out | <i>ChannelId</i> | channel_id to be used (for manual mode)                |
| out | <i>Priority</i>  | priority of connection (for backup and load balancing) |

#### Exceptions

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                      |
| <i>OpNotSucceeded</i>   | internal error only                                                                            |
| <i>InvalidSelection</i> | invalid CwgId, ConnId                                                                          |
| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |

#### Version

release 10.10

**8.62.4.28** void DCM::DeviceControl::GetCwgConnList ( in unsigned long *CwgId*, out IdList *ConnIds* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Get list of available connections (channels) for an CWG proxy.

#### Parameters

|     |                |                                          |
|-----|----------------|------------------------------------------|
| in  | <i>CwgId</i>   | proxy_id (range [0, 40]) of CWG proxy    |
| out | <i>ConnIds</i> | list of configured connections (conn_id) |

#### Exceptions

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                      |
| <i>OpNotSucceeded</i>   | internal error only                                                                            |
| <i>InvalidSelection</i> | invalid CwgId                                                                                  |
| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |

**Version**

release 9.0

**8.62.4.29** void DCM::DeviceControl::GetCwgConnStatus ( in unsigned long *CwgId*, in unsigned long *ConnId*, out eCwgConnectionStatus *ConnectionStatus*, out unsigned short *UsedChannelId*, out unsigned short *NoOfOpenStreams* ) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Get status of connection (channel) in CWG proxy.

**Parameters**

|     |                          |                                                |
|-----|--------------------------|------------------------------------------------|
| in  | <i>CwgId</i>             | proxy_id (range [0, 40]) of CWG proxy          |
| in  | <i>ConnId</i>            | conn_id of connection (channel)                |
| out | <i>Connection-Status</i> | status of connection                           |
| out | <i>UsedChannelId</i>     | channel_id used for connection                 |
| out | <i>NoOfOpen-Streams</i>  | number of open streams on connection (channel) |

**Exceptions**

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>Timeout</i>          | a timeout occurred during IIOP processing                                                      |
| <i>OpNotSucceeded</i>   | internal error only                                                                            |
| <i>InvalidSelection</i> | invalid CwgId, ConnId                                                                          |
| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |

**Version**

release 9.0

**8.62.4.30** void DCM::DeviceControl::GetCwgOverrule ( in unsigned long *CwgId*, out boolean *OverruleMaxCompTime*, out short *MaxCompTime*, out boolean *OverruleMaxStreams*, out unsigned short *MaxStreams* ) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Get CWG proxy advanced settings.

**Parameters**

|     |                             |                                           |
|-----|-----------------------------|-------------------------------------------|
| in  | <i>CwgId</i>                | proxy_id (range [0, 40]) of CWG proxy     |
| out | <i>OverruleMax-CompTime</i> | flag to overrule max_comp_time            |
| out | <i>MaxCompTime</i>          | overruled value for max_comp_time (in ms) |
| out | <i>OverruleMax-Streams</i>  | flag to overrule max_streams              |
| out | <i>MaxStreams</i>           | overruled value for max_streams           |

**Exceptions**

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                      |
| <i>OpNotSucceeded</i>   | internal error only                                                                            |
| <i>InvalidSelection</i> | invalid CwgId                                                                                  |
| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |

**Version**

release 9.0

**8.62.4.31** void DCM::DeviceControl::GetCwgStatus ( in unsigned long *CwgId*, out unsigned long *NoOfRequestedStreams*, out unsigned long *NoOfOpenStreams* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Get status of CWG proxy.

**Parameters**

|     |                             |                                                           |
|-----|-----------------------------|-----------------------------------------------------------|
| in  | <i>CwgId</i>                | proxy_id (range [0, 40[) of CWG proxy                     |
| out | <i>NoOfRequestedStreams</i> | total number of requested streams on proxy (all channels) |
| out | <i>NoOfOpenStreams</i>      | total number of open streams on proxy (all channels)      |

**Exceptions**

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                      |
| <i>OpNotSucceeded</i>   | internal error only                                                                            |
| <i>InvalidSelection</i> | invalid CwgId                                                                                  |
| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |

**Version**

release 9.0

**8.62.4.32** void DCM::DeviceControl::GetEcmgBackup ( in unsigned long *EcmgId*, out boolean *BackupRevertive*, out long *RevertTime*, out boolean *HotStandby* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Get ECMG backup settings (obsolete!).

**Parameters**

|     |                        |                                        |
|-----|------------------------|----------------------------------------|
| in  | <i>EcmgId</i>          | proxy_id (range [0, 40[) of ECMG proxy |
| out | <i>BackupRevertive</i> | ???                                    |
| out | <i>RevertTime</i>      | ??? (in sec)                           |
| out | <i>HotStandby</i>      | ???                                    |

**Exceptions**

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                      |
| <i>OpNotSucceeded</i>   | internal error                                                                                 |
| <i>InvalidSelection</i> | invalid EcmgId                                                                                 |
| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |

**Version**

release 2.0

**Deprecated** This call should not be used on [DCM](#).

**8.62.4.33** void DCM::DeviceControl::GetEcmgConfig ( in unsigned long *EcmgId*, out string *Name*, out eEcmgType *EcmgType*, out unsigned short *CasId*, out unsigned short *SubCasId*, out eEcmPidSource *EcmPidSource*, out unsigned short *EcmPidLowerLimit*, out unsigned short *EcmPidUpperLimit*, out eEcmgChannelIdMode *EcmgChannelIdMode* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Get ECMG proxy configuration settings.

**Parameters**

|     |                          |                                                   |
|-----|--------------------------|---------------------------------------------------|
| in  | <i>EcmgId</i>            | proxy_id (range [0, 40]) of ECMG proxy            |
| out | <i>Name</i>              | name of ECMG proxy                                |
| out | <i>EcmgType</i>          | type of ECMG proxy                                |
| out | <i>CasId</i>             | CA_system_id of ECMG                              |
| out | <i>SubCasId</i>          | CA_subsystem_id of ECMG                           |
| out | <i>EcmPidSource</i>      | ECM pid source                                    |
| out | <i>EcmPidLowerLimit</i>  | lower limit for ECM pid selection (for auto mode) |
| out | <i>EcmPidUpperLimit</i>  | upper limit for ECM pid selection (for auto mode) |
| out | <i>EcmgChannelIdMode</i> | ECMG channel_id selection mode                    |

**Exceptions**

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                      |
| <i>OpNotSucceeded</i>   | internal error                                                                                 |
| <i>InvalidSelection</i> | invalid EcmgId                                                                                 |
| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |

**Version**

release 2.0

**Deprecated** This call should not be used anymore since release 8.9 (replaced by call GetEcmgConfig\_V2)

**8.62.4.34** void DCM::DeviceControl::GetEcmgConfig\_V2 ( in unsigned long *EcmgId*, out string *Name*, out eEcmgType\_V2 *EcmgType*, out unsigned short *CasId*, out unsigned short *SubCasId*, out eEcmPidSource *EcmPidSource*, out unsigned short *EcmPidLowerLimit*, out unsigned short *EcmPidUpperLimit*, out eEcmgChannelIdMode *EcmgChannelIdMode* ) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Get ECMG proxy configuration settings.

#### Parameters

|     |                          |                                                   |
|-----|--------------------------|---------------------------------------------------|
| in  | <i>EcmgId</i>            | proxy_id (range [0, 40[) of ECMG proxy            |
| out | <i>Name</i>              | name of ECMG proxy                                |
| out | <i>EcmgType</i>          | type of ECMG proxy                                |
| out | <i>CasId</i>             | CA_system_id of ECMG                              |
| out | <i>SubCasId</i>          | CA_subsystem_id of ECMG                           |
| out | <i>EcmPidSource</i>      | ECM pid source                                    |
| out | <i>EcmPidLowerLimit</i>  | lower limit for ECM pid selection (for auto mode) |
| out | <i>EcmPidUpperLimit</i>  | upper limit for ECM pid selection (for auto mode) |
| out | <i>EcmgChannelIdMode</i> | ECMG channel_id selection mode                    |

#### Exceptions

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>Timeout</i>          | a timeout occurred during IIOP processing                                                      |
| <i>OpNotSucceeded</i>   | internal error                                                                                 |
| <i>InvalidSelection</i> | invalid EcmgId                                                                                 |
| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |

#### Version

release 8.9 - PowerVu type behaves as Standard ECMG  
release 9.0

**8.62.4.35** void DCM::DeviceControl::GetEcmgConnConfig ( in unsigned long *EcmgId*, in unsigned long *ConnId*, out unsigned long *IpAddress*, out unsigned short *Port*, out unsigned short *ChannelId*, out long *Priority* ) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

Get connection (channel) configuration settings.

#### Parameters

|     |                  |                                                        |
|-----|------------------|--------------------------------------------------------|
| in  | <i>EcmgId</i>    | proxy_id (range [0, 40[) of ECMG proxy                 |
| in  | <i>ConnId</i>    | conn_id of connection (channel)                        |
| out | <i>IpAddress</i> | IP address of ECMG to connect with                     |
| out | <i>Port</i>      | port on ECMG to establish connection on                |
| out | <i>ChannelId</i> | channel_id to be used (for manual mode)                |
| out | <i>Priority</i>  | priority of connection (for backup and load balancing) |

**Exceptions**

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                      |
| <i>OpNotSucceeded</i>   | internal error only                                                                            |
| <i>InvalidSelection</i> | invalid EcmgId, ConnId                                                                         |
| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |
| <i>OutOfRange</i>       | when parameters invalid (e.g. IPv6 address configured)                                         |

**Version**

release 2.0

**Deprecated** This call should not be used anymore since release 10.10 (replaced by call GetEcmgConnConfig\_V2)

**8.62.4.36** void DCM::DeviceControl::GetEcmgConnConfig\_V2 ( in unsigned long *EcmgId*, in unsigned long *ConnId*, out string *IPAddress*, out unsigned short *Port*, out unsigned short *ChannelId*, out long *Priority* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Get connection (channel) configuration settings.

**Parameters**

|     |                  |                                                        |
|-----|------------------|--------------------------------------------------------|
| in  | <i>EcmgId</i>    | proxy_id (range [0, 40]) of ECMG proxy                 |
| in  | <i>ConnId</i>    | conn_id of connection (channel)                        |
| out | <i>IPAddress</i> | IP address of ECMG to connect with                     |
| out | <i>Port</i>      | port on ECMG to establish connection on                |
| out | <i>ChannelId</i> | channel_id to be used (for manual mode)                |
| out | <i>Priority</i>  | priority of connection (for backup and load balancing) |

**Exceptions**

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                      |
| <i>OpNotSucceeded</i>   | internal error only                                                                            |
| <i>InvalidSelection</i> | invalid EcmgId, ConnId                                                                         |
| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |

**Version**

release 10.10

**8.62.4.37** void DCM::DeviceControl::GetEcmgConnList ( in unsigned long *EcmgId*, out IdList *ConnIds* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Get list of available connections (channels) for an ECMG proxy.

**Parameters**

|     |                |                                          |
|-----|----------------|------------------------------------------|
| in  | <i>EcmgId</i>  | proxy_id (range [0, 40]) of ECMG proxy   |
| out | <i>ConnIds</i> | list of configured connections (conn_id) |

**Exceptions**

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>Timeout</i>          | a timeout occurred during IIOP processing                                                      |
| <i>OpNotSucceeded</i>   | internal error only                                                                            |
| <i>InvalidSelection</i> | invalid EcmgId                                                                                 |
| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |

**Version**

release 8.9

**8.62.4.38** void DCM::DeviceControl::GetEcmgConnStatus ( in unsigned long *EcmgId*, in unsigned long *ConnId*, out eEcmgConnectionStatus *EcmgConnectionStatus*, out unsigned short *UsedChannelId*, out unsigned short *NoOfOpenStreams* ) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Get status of connection (channel) in ECMG proxy.

**Parameters**

|     |                               |                                                |
|-----|-------------------------------|------------------------------------------------|
| in  | <i>EcmgId</i>                 | proxy_id (range [0, 40]) of ECMG proxy         |
| in  | <i>ConnId</i>                 | conn_id of connection (channel)                |
| out | <i>Ecmg-Connection-Status</i> | status of connection                           |
| out | <i>UsedChannelId</i>          | channel_id used for connection                 |
| out | <i>NoOfOpen-Streams</i>       | number of open streams on connection (channel) |

**Exceptions**

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>Timeout</i>          | a timeout occurred during IIOP processing                                                      |
| <i>OpNotSucceeded</i>   | internal error only                                                                            |
| <i>InvalidSelection</i> | invalid EcmgId, ConnId                                                                         |
| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |

**Version**

release 2.0

**8.62.4.39** void DCM::DeviceControl::GetEcmgDescList ( in unsigned long *EcmgId*, out IdList *DescRuleIds* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Get list of available descriptor rules for ECMG proxy.

**Parameters**

|     |                    |                                                    |
|-----|--------------------|----------------------------------------------------|
| in  | <i>EcmgId</i>      | proxy_id (range [0, 40]) of ECMG proxy             |
| out | <i>DescRuleIds</i> | list of configured descriptor rules (desc_rule_id) |

**Exceptions**

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                      |
| <i>OpNotSucceeded</i>   | internal error only                                                                            |
| <i>InvalidSelection</i> | invalid EcmgId                                                                                 |
| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |

**Version**

release 2.0

**8.62.4.40** void DCM::DeviceControl::GetEcmgDescriptor ( in unsigned long *EcmgId*, in unsigned long *DescRuleId*, out string *DescRuleName*, out eEcmgDescRuleType *Type*, out eDescInsertionLevel *InsertionLevel*, out string *DescriptorData*, out EcmIdList *EcmlDs* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Get descriptor rule (on ECMG proxy) configuration settings.

**Parameters**

|     |                       |                                                                 |
|-----|-----------------------|-----------------------------------------------------------------|
| in  | <i>EcmgId</i>         | proxy_id (range [0, 40]) of ECMG proxy                          |
| in  | <i>DescRuleId</i>     | desc_rule_id of descriptor rule                                 |
| out | <i>DescRuleName</i>   | name of descriptor rule                                         |
| out | <i>Type</i>           | type of descriptor rule ('add private data' or 'do not insert') |
| out | <i>InsertionLevel</i> | insertion level of descriptor                                   |
| out | <i>DescriptorData</i> | extra (private) data to append to descriptor                    |
| out | <i>EcmlDs</i>         | list of EcmId's where descriptor rule applies to                |

**Exceptions**

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                      |
| <i>OpNotSucceeded</i>   | internal error only                                                                            |
| <i>InvalidSelection</i> | invalid EcmgId, DescRuleId                                                                     |
| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |

**Remarks**

descriptor string format: hex byte array possible future extentions:

- EcmPid: inserts 13 bit ECM pid (preceeded by hex nibble E of which one bit is overwritten)
- EcmId: inserts 16 bits EcmId
- CasId: inserts 16 bits CasId

**Version**

release 2.0

**Deprecated** This call should not be used anymore since release 8.1 (replaced by call GetEcmgDescriptor\_V2)

**8.62.4.41** void DCM::DeviceControl::GetEcmgDescriptor\_V2 ( in unsigned long *EcmgId*, in unsigned long *DescRuleId*, out string *DescRuleName*, out eEcmgDescRuleType *Type*, out eDescInsertionLevel\_V2 *InsertionLevel*, out string *DescriptorData*, out EcmIdList *EcmIds* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Get descriptor rule (on ECMG proxy) configuration settings.

**Parameters**

|     |                       |                                                                 |
|-----|-----------------------|-----------------------------------------------------------------|
| in  | <i>EcmgId</i>         | proxy_id (range [0, 40]) of ECMG proxy                          |
| in  | <i>DescRuleId</i>     | desc_rule_id of descriptor rule                                 |
| out | <i>DescRuleName</i>   | name of descriptor rule                                         |
| out | <i>Type</i>           | type of descriptor rule ('add private date' or 'do not insert') |
| out | <i>InsertionLevel</i> | insertion level of descriptor                                   |
| out | <i>DescriptorData</i> | extra (private) data to append to descriptor                    |
| out | <i>EcmIds</i>         | list of EcmId's where descriptor rule applies to                |

**Exceptions**

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                      |
| <i>OpNotSucceeded</i>   | internal error only                                                                            |
| <i>InvalidSelection</i> | invalid EcmgId, DescRuleId                                                                     |
| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |

**Remarks**

descriptor string format: hex byte array possible future extentions:

- EcmPid: inserts 13 bit ECM pid (preceeded by hex nibble E of which one bit is overwritten)
- EcmId: inserts 16 bits EcmId
- CasId: inserts 16 bits CasId

**Version**

release 8.1

**8.62.4.42** void DCM::DeviceControl::GetEcmgNotifyCPExtension ( in unsigned long *EcmgId*, out boolean *NotifyCPExtension* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Get ECMG notify CP extension.

#### Parameters

|     |                          |                                                                    |
|-----|--------------------------|--------------------------------------------------------------------|
| in  | <i>EcmgId</i>            | proxy_id (range [0, 40[) of ECMG proxy                             |
| out | <i>NotifyCPExtension</i> | enable/disable CP extension notification (range [0, 1], default 0) |

#### Exceptions

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                      |
| <i>OpNotSucceeded</i>   | internal error only                                                                            |
| <i>InvalidSelection</i> | invalid EcmgId                                                                                 |
| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |

#### Version

release 8.9

**8.62.4.43** void DCM::DeviceControl::GetEcmgOverrule ( in unsigned long *EcmgId*, out boolean *OverruleMaxCompTime*, out short *MaxCompTime*, out boolean *OverruleMinimumCPDuration*, out unsigned long *MinimumCPDuration*, out boolean *OverruleTransitionStartDelay*, out short *TransitionStartDelay*, out boolean *OverruleTransitionStopDelay*, out short *TransitionStopDelay*, out boolean *OverruleStartDelay*, out short *StartDelay*, out boolean *OverruleStopDelay*, out short *StopDelay*, out boolean *OverruleAcStartDelay*, out short *AcStartDelay*, out boolean *OverruleAcStopDelay*, out short *AcStopDelay* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Get ECMG proxy advanced settings (part 1).

#### Parameters

|     |                                     |                                                    |
|-----|-------------------------------------|----------------------------------------------------|
| in  | <i>EcmgId</i>                       | proxy_id (range [0, 40[) of ECMG proxy             |
| out | <i>OverruleMaxCompTime</i>          | flag to overrule max_comp_time                     |
| out | <i>MaxCompTime</i>                  | overruled value for max_comp_time (in ms)          |
| out | <i>OverruleMinimumCPDuration</i>    | flag to overrule min_CP_duration                   |
| out | <i>MinimumCPDuration</i>            | overruled value for min_CP_duration (in ms)        |
| out | <i>OverruleTransitionStartDelay</i> | flag to overrule transition_delay_start            |
| out | <i>TransitionStartDelay</i>         | overruled value for transition_delay_start (in ms) |

|     |                                    |                                                    |
|-----|------------------------------------|----------------------------------------------------|
| out | <i>OverrideTransitionStopDelay</i> | flag to override transition_delay_stop             |
| out | <i>TransitionStopDelay</i>         | overruled value for taransition_delay_stop (in ms) |
| out | <i>OverrideStartDelay</i>          | flag to override delay_start                       |
| out | <i>StartDelay</i>                  | overruled value for delay_start (in ms)            |
| out | <i>OverrideStopDelay</i>           | flag to override dalay_stop                        |
| out | <i>StopDelay</i>                   | overruled value for delay_stop (in ms)             |
| out | <i>OverrideAcStartDelay</i>        | flag to override AC_delay_start                    |
| out | <i>AcStartDelay</i>                | overruled value for AC_delay_start (in ms)         |
| out | <i>OverrideAcStopDelay</i>         | flag to override AC_delay_stop                     |
| out | <i>AcStopDelay</i>                 | overruled value for AC_delay_stop (in ms)          |

### Exceptions

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>Timeout</i>          | a timeout occurred during IIOP processing                                                      |
| <i>OpNotSucceeded</i>   | internal error only                                                                            |
| <i>InvalidSelection</i> | invalid EcmgId                                                                                 |
| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |

### Version

release 2.0

**8.62.4.44** void DCM::DeviceControl::GetEcmgOverrideExt ( in unsigned long *EcmgId*, out boolean *OverrideMaxStreams*, out unsigned short *MaxStreams*, out boolean *OverrideEcmRepPeriod*, out unsigned short *EcmRepPeriod* ) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Get ECMG proxy advanced settings (part 2).

### Parameters

|     |                             |                                            |
|-----|-----------------------------|--------------------------------------------|
| in  | <i>EcmgId</i>               | proxy_id (range [0, 40]) of ECMG proxy     |
| out | <i>OverrideMaxStreams</i>   | flag to override max_streams               |
| out | <i>MaxStreams</i>           | overruled value for max_streams            |
| out | <i>OverrideEcmRepPeriod</i> | flag to override ECM_rep_period            |
| out | <i>EcmRepPeriod</i>         | overruled value for ECM_rep_period (in ms) |

**Exceptions**

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                      |
| <i>OpNotSucceeded</i>   | internal error only                                                                            |
| <i>InvalidSelection</i> | invalid EcmgId                                                                                 |
| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |

**Version**

release 2.0

**8.62.4.45** void DCM::DeviceControl::GetEcmgStatus ( in unsigned long *EcmgId*, out unsigned long *NoOfRequestedStreams*, out unsigned long *NoOfOpenStreams* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Get status of ECMG proxy.

**Parameters**

|     |                             |                                                           |
|-----|-----------------------------|-----------------------------------------------------------|
| in  | <i>EcmgId</i>               | proxy_id (range [0, 40[) of ECMG proxy                    |
| out | <i>NoOfRequestedStreams</i> | total number of requested streams on proxy (all channels) |
| out | <i>NoOfOpenStreams</i>      | total number of open streams on proxy (all channels)      |

**Exceptions**

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                      |
| <i>OpNotSucceeded</i>   | internal error only                                                                            |
| <i>InvalidSelection</i> | invalid EcmgId                                                                                 |
| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |

**Version**

release 2.0

**8.62.4.46** void DCM::DeviceControl::GetEisConfig ( in unsigned long *EisId*, out string *Name*, out eEisType *EisType*, out unsigned short *TcpPort*, out boolean *OverrideRecommendedCpDuration*, out unsigned long *RecommendedCpDuration* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Get EIS proxy configuration settings.

**Parameters**

|     |                |                                       |
|-----|----------------|---------------------------------------|
| in  | <i>EisId</i>   | proxy_id (range [0, 40[) of EIS proxy |
| out | <i>Name</i>    | name of EIS proxy                     |
| out | <i>EisType</i> | type of EIS proxy                     |

|     |                                        |                                                     |
|-----|----------------------------------------|-----------------------------------------------------|
| out | <i>TcpPort</i>                         | TCP port where to listen for EIS                    |
| out | <i>Override-Recommended-CpDuration</i> | flag to override recommended_CP_duration            |
| out | <i>Recommended-CpDuration</i>          | overruled value for recommended_CP_duration (in ms) |

**Exceptions**

|                         |                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------|
| <i>Timeout</i>          | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i>   | internal error only                                                                                      |
| <i>InvalidSelection</i> | invalid EisId                                                                                            |
| <i>OpNotAllowed</i>     | not logged on                                                                                            |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or when call not yet supported on running software version |

**Version**

release 2.0

**8.62.4.47** void DCM::DeviceControl::GetEisStatus ( in unsigned long *EisId*, out eConnectionState *EisConnectionState*, out unsigned long *ConnectionPeer* ) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

Get status of EIS proxy.

**Parameters**

|     |                            |                                       |
|-----|----------------------------|---------------------------------------|
| in  | <i>EisId</i>               | proxy_id (range [0, 40[) of EIS proxy |
| out | <i>EisConnection-State</i> | status of connection                  |
| out | <i>Connection-Peer</i>     | IP address of connected EIS           |

**Exceptions**

|                         |                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------|
| <i>Timeout</i>          | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i>   | internal error only                                                                                      |
| <i>InvalidSelection</i> | invalid EisId                                                                                            |
| <i>OpNotAllowed</i>     | not logged on                                                                                            |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or when call not yet supported on running software version |
| <i>OutOfRange</i>       | when parameters invalid (e.g. peer has IPv6 address)                                                     |

**Version**

release 2.0

**Deprecated** This call should not be used anymore since release 10.10 (replaced by call GetEisStatus\_V2)

**8.62.4.48** void DCM::DeviceControl::GetEisStatus\_V2 ( in unsigned long *EisId*, out eConnectionState *EisConnectionState*, out string *ConnectionPeer* ) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Get status of EIS proxy.

#### Parameters

|     |                            |                                       |
|-----|----------------------------|---------------------------------------|
| in  | <i>EisId</i>               | proxy_id (range [0, 40[) of EIS proxy |
| out | <i>EisConnection-State</i> | status of connection                  |
| out | <i>Connection-Peer</i>     | IP address of connected EIS           |

#### Exceptions

|                         |                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------|
| <i>Timeout</i>          | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i>   | internal error only                                                                                      |
| <i>InvalidSelection</i> | invalid EisId                                                                                            |
| <i>OpNotAllowed</i>     | not logged on                                                                                            |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or when call not yet supported on running software version |

#### Version

release 10.10

**8.62.4.49** void DCM::DeviceControl::GetEmmgConfig ( in unsigned long *EmmgId*, out string *Name*, out long *ClientId*, out eDataSocket *DataSocket*, out unsigned short *TcpPort*, out unsigned short *UdpPort*, out unsigned long *MaxBandwidth*, out eEmmPidSource *EmmPidSource*, out unsigned short *EmmPidLowerLimit*, out unsigned short *EmmPidUpperLimit*, out eEmmSectionGrouping *SectionGrouping* ) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Get EMMG proxy configuration settings.

#### Parameters

|     |                          |                                                                    |
|-----|--------------------------|--------------------------------------------------------------------|
| in  | <i>EmmgId</i>            | proxy_id (range [0, 40[) of EMMG proxy                             |
| out | <i>Name</i>              | name of EMMG proxy                                                 |
| out | <i>ClientId</i>          | client_id of EMMG                                                  |
| out | <i>DataSocket</i>        | type of data for socket (TCP or UDP)                               |
| out | <i>TcpPort</i>           | TCP port where to listen for EMMG                                  |
| out | <i>UdpPort</i>           | UDP port where to listen for EMMG                                  |
| out | <i>MaxBandwidth</i>      | maximum bandwidth to be used for EMM (in bps)                      |
| out | <i>EmmPidSource</i>      | EMM pid source (stream_id, channel_id, data_id, packet_id or auto) |
| out | <i>EmmPidLower-Limit</i> | lower limit for EMM pid selection (for auto mode)                  |
| out | <i>EmmPidUpper-Limit</i> | upper limit for EMM pid selection (for auto mode)                  |
| out | <i>Section-Grouping</i>  | enable/disable section frouping for EMM's                          |

**Remarks**

ClientId -1 for don't care

MaxBandwidth triggers only alarm, no specific enforcing beyond the total output bandwidth limit

**Exceptions**

|                         |                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i>   | internal error only                                                                                      |
| <i>InvalidSelection</i> | invalid EmmgId                                                                                           |
| <i>OpNotAllowed</i>     | not logged on                                                                                            |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or when call not yet supported on running software version |

**Version**

release 2.0

**8.62.4.50** void DCM::DeviceControl::GetEmmgDescList ( in unsigned long *EmmgId*, out IdList *DescRuleIds* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Get list of available descriptor rules for EMMG proxy.

**Parameters**

|     |                    |                                                    |
|-----|--------------------|----------------------------------------------------|
| in  | <i>EmmgId</i>      | proxy_id (range [0, 40]) of EMMG proxy             |
| out | <i>DescRuleIds</i> | list of configured descriptor rules (desc_rule_id) |

**Exceptions**

|                         |                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i>   | internal error only                                                                                      |
| <i>InvalidSelection</i> | invalid EmmgId                                                                                           |
| <i>OpNotAllowed</i>     | not logged on                                                                                            |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or when call not yet supported on running software version |

**Version**

release 2.0

**8.62.4.51** void DCM::DeviceControl::GetEmmgDescriptor ( in unsigned long *EmmgId*, in unsigned long *DescRuleId*, out string *DescRuleName*, out eEmmgDescRuleType *Type*, out string *DescriptorData*, out DataIdList *DataIds* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Get descriptor rule (on EMMG proxy) configuration settings.

**Parameters**

|     |                       |                                                                |
|-----|-----------------------|----------------------------------------------------------------|
| in  | <i>EmmgId</i>         | proxy_id (range [0, 40[) of EMMG proxy                         |
| out | <i>DescRuleId</i>     | desc_rule_id of descriptor rule                                |
| out | <i>DescRuleName</i>   | name of descriptor rule                                        |
| out | <i>Type</i>           | type of descriptor rule ('add private data' or 'do no insert') |
| out | <i>DescriptorData</i> | extra (private) data to append to descriptor                   |
| out | <i>DataIds</i>        | list of DataId's where descriptor rule applies to              |

**Exceptions**

|                         |                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i>   | internal error only                                                                                      |
| <i>InvalidSelection</i> | invalid EmmgId, DescRuleId                                                                               |
| <i>OpNotAllowed</i>     | not logged on                                                                                            |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or when call not yet supported on running software version |

**Version**

release 2.0

**8.62.4.52** void DCM::DeviceControl::GetEmmgStatus ( in unsigned long *EmmgId*, out eConnectionState *EmmgConnectionState*, out unsigned long *NoOfOpenStreams*, out unsigned long *CurrentBandwidth*, out unsigned long *ConnectionPeer* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

Get status of EMMG proxy.

**Parameters**

|     |                              |                                                          |
|-----|------------------------------|----------------------------------------------------------|
| in  | <i>EmmgId</i>                | proxy_id (range [0, 40[) of EMMG proxy                   |
| out | <i>Emmg-Connection-State</i> | status of connection                                     |
| out | <i>NoOfOpen-Streams</i>      | number of open streams on connection                     |
| out | <i>Current-Bandwidth</i>     | total bandwidth of all EMM's currently imported via EMMG |
| out | <i>Connection-Peer</i>       | IP address of connected EMMG                             |

**Exceptions**

|                         |                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i>   | internal error only                                                                                      |
| <i>InvalidSelection</i> | invalid EmmgId                                                                                           |
| <i>OpNotAllowed</i>     | not logged on                                                                                            |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or when call not yet supported on running software version |
| <i>OutOfRange</i>       | when parameters invalid (e.g. peer has IPv6 address)                                                     |

**Version**

release 2.0

**Deprecated** This call should not be used anymore since release 10.10 (replaced by call GetEmmgStatus\_V2)

**8.62.4.53** void DCM::DeviceControl::GetEmmgStatus\_V2 ( in unsigned long *EmmgId*, out eConnectionState *EmmgConnectionState*, out unsigned long *NoOfOpenStreams*, out unsigned long *CurrentBandwidth*, out string *ConnectionPeer* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Get status of EMMG proxy.

**Parameters**

|     |                              |                                                          |
|-----|------------------------------|----------------------------------------------------------|
| in  | <i>EmmgId</i>                | proxy_id (range [0, 40]) of EMMG proxy                   |
| out | <i>Emmg-Connection-State</i> | status of connection                                     |
| out | <i>NoOfOpen-Streams</i>      | number of open streams on connection                     |
| out | <i>Current-Bandwidth</i>     | total bandwidth of all EMM's currently imported via EMMG |
| out | <i>Connection-Peer</i>       | IP address of connected EMMG                             |

**Exceptions**

|                         |                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i>   | internal error only                                                                                      |
| <i>InvalidSelection</i> | invalid EmmgId                                                                                           |
| <i>OpNotAllowed</i>     | not logged on                                                                                            |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or when call not yet supported on running software version |

**Version**

release 10.10

**8.62.4.54** void DCM::DeviceControl::GetHotEcmgConnection ( in unsigned long *EcmgId*, out boolean *bBackupHotStandby* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Get ECMG hot connection backup setting(override ECMG disconnection).

**Parameters**

|     |                           |                                                          |
|-----|---------------------------|----------------------------------------------------------|
| in  | <i>EcmgId</i>             | proxy_id (range [0, 40]) of ECMG proxy                   |
| out | <i>bBackupHot-Standby</i> | flag to indicate if hot ECMG connection backup is needed |

**Exceptions**

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                      |
| <i>OpNotSucceeded</i>   | internal error only                                                                            |
| <i>InvalidSelection</i> | invalid EcmgId                                                                                 |
| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |

**Remarks**

non-active [DCM](#) will set up connection to ECMG, except if hot connection backup is disabled.

**Version**

release 2.5

**8.62.4.55** void DCM::DeviceControl::GetInterfaceList ( out IdList *EcmgIds*, out IdList *EmmgIds*, out IdList *EisIds*, out IdList *PsigIds*, out IdList *MCryptEisIds*, out IdList *MCryptPsigIds* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get list of configured proxies.

**Parameters**

|     |                      |                                            |
|-----|----------------------|--------------------------------------------|
| out | <i>EcmgIds</i>       | list of ECMG's (proxy_id)                  |
| out | <i>EmmgIds</i>       | list of EMMG's (proxy_id)                  |
| out | <i>EisIds</i>        | list of EIS's (proxy_id)                   |
| out | <i>PsigIds</i>       | list of PSIG's (proxy_id)                  |
| out | <i>MCryptEisIds</i>  | list of MCrypt EIS's (proxy_id), obsolete  |
| out | <i>MCryptPsigIds</i> | list of MCrypt PSIG's (proxy_id), obsolete |

**Exceptions**

|                       |                                                                                                          |
|-----------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i> | internal error only                                                                                      |
| <i>OpNotAllowed</i>   | not logged on                                                                                            |
| <i>OpNotSupported</i> | when called on other board than the mainboard or when call not yet supported on running software version |

**Version**

release 2.0

**8.62.4.56** void DCM::DeviceControl::GetInterfaceList\_V2 ( out IdList *EcmgIds*, out IdList *EmmgIds*, out IdList *EisIds*, out IdList *PsigIds*, out IdList *CwglIds* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get list of configured proxies.

**Parameters**

|     |                |                           |
|-----|----------------|---------------------------|
| out | <i>EcmgIds</i> | list of ECMG's (proxy_id) |
| out | <i>EmmgIds</i> | list of EMMG's (proxy_id) |

| out | <i>PsigIds</i> | list of PSIG's (proxy_id) |
| out | <i>CwgIds</i>  | list of CWG's (proxy_id)  |

**Exceptions**

|                       |                                                                                                          |
|-----------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i> | internal error only                                                                                      |
| <i>OpNotAllowed</i>   | not logged on                                                                                            |
| <i>OpNotSupported</i> | when called on other board than the mainboard or when call not yet supported on running software version |

**Version**

release 8.9

**8.62.4.57** void DCM::DeviceControl::GetJclConfig ( out JclInitialValue\_t *InitialValue*, out JclSystemId\_t *SystemId* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get JCL configuration.

**Parameters**

|     |                     |                   |
|-----|---------------------|-------------------|
| out | <i>InitialValue</i> | JCL initial value |
| out | <i>SystemId</i>     | JCL system ID     |

**Exceptions**

|                       |                                                                                                          |
|-----------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i> | internal error only                                                                                      |
| <i>OpNotAllowed</i>   | not logged on                                                                                            |
| <i>OpNotSupported</i> | when called on other board than the mainboard or when call not yet supported on running software version |

**Version**

release 2.0

**Note**

JCL scrambling not yet supported

**8.62.4.58** void DCM::DeviceControl::GetPsigConfig ( in unsigned long *PsigId*, out string *Name*, out ePsigType *PsigType*, out unsigned short *TcpPort*, out unsigned long *MaxBandwidth* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Set PSIG proxy configuration settings.

**Parameters**

|     |                     |                                               |
|-----|---------------------|-----------------------------------------------|
| in  | <i>PsigId</i>       | proxy_id (range [0, 40]) of PSIG proxy        |
| out | <i>Name</i>         | name of PSIG proxy                            |
| out | <i>PsigType</i>     | type of PSIG proxy                            |
| out | <i>TcpPort</i>      | TCP port where to listen for PSIG             |
| out | <i>MaxBandwidth</i> | maximum bandwidth to be used for PSI (in bps) |

**Remarks**

MaxBandwidth triggers only alarm, no specific enforcing beyond the total output bandwidth limit

**Exceptions**

|                         |                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i>   | internal error only                                                                                      |
| <i>InvalidSelection</i> | invalid EisId                                                                                            |
| <i>OpNotAllowed</i>     | not logged on                                                                                            |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or when call not yet supported on running software version |

**Version**

release 2.0

**8.62.4.59** void DCM::DeviceControl::GetPsigConfig2 ( in unsigned long *PsigId*, out string *Name*, out ePsigType *PsigType*, out unsigned short *TcpPort*, out unsigned long *MaxBandwidth*, out boolean *DoNotModify* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Set PSIG proxy configuration settings.

**Parameters**

|     |                     |                                                                                                    |
|-----|---------------------|----------------------------------------------------------------------------------------------------|
| in  | <i>PsigId</i>       | proxy_id (range [0, 40]) of PSIG proxy                                                             |
| out | <i>Name</i>         | name of PSIG proxy                                                                                 |
| out | <i>PsigType</i>     | type of PSIG proxy                                                                                 |
| out | <i>TcpPort</i>      | TCP port where to listen for PSIG                                                                  |
| out | <i>MaxBandwidth</i> | maximum bandwidth to be used for PSI (in bps)                                                      |
| in  | <i>DoNotModify</i>  | Tables imported on this proxy will be played out exactly as received, without changing any fields. |

**Remarks**

MaxBandwidth triggers only alarm, no specific enforcing beyond the total output bandwidth limit

**Exceptions**

|                         |                                           |
|-------------------------|-------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing |
| <i>OpNotSucceeded</i>   | internal error only                       |
| <i>InvalidSelection</i> | invalid EisId                             |
| <i>OpNotAllowed</i>     | not logged on                             |

|                       |                                                                                                          |
|-----------------------|----------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | when called on other board than the mainboard or when call not yet supported on running software version |
|-----------------------|----------------------------------------------------------------------------------------------------------|

**Version**

release 7.0

**8.62.4.60** void DCM::DeviceControl::GetPsigConfig3 ( in unsigned long *PsigId*, out string *Name*, out ePsigType *PsigType*, out unsigned short *TcpPort*, out unsigned long *MaxBandwidth*, out boolean *DoNotModify*, out boolean *MultipleNITa* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Get PSIG proxy configuration settings.

**Parameters**

|     |                     |                                                                                                    |
|-----|---------------------|----------------------------------------------------------------------------------------------------|
| in  | <i>PsigId</i>       | proxy_id (range [0, 40]) of PSIG proxy                                                             |
| out | <i>Name</i>         | name of PSIG proxy                                                                                 |
| out | <i>PsigType</i>     | type of PSIG proxy                                                                                 |
| out | <i>TcpPort</i>      | TCP port where to listen for PSIG                                                                  |
| out | <i>MaxBandwidth</i> | maximum bandwidth to be used for PSI (in bps)                                                      |
| out | <i>DoNotModify</i>  | Tables imported on this proxy will be played out exactly as received, without changing any fields. |
| out | <i>MultipleNITa</i> | If set, more than one NITa can be provisioned for the same TS                                      |

**Remarks**

MaxBandwidth triggers only alarm, no specific enforcing beyond the total output bandwidth limit

**Exceptions**

|                         |                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i>   | internal error only                                                                                      |

| <i>OpNotAllowed</i>     | not logged on                                                                                            |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or when call not yet supported on running software version |

**Version**

release 9.0

**8.62.4.61** void DCM::DeviceControl::GetPsigStatus ( in unsigned long *PsigId*, out eConnectionState *PsigConnectionState*, out unsigned long *NoOfStreams*, out unsigned long *CurrentBandwidth*, out unsigned long *ConnectionPeer* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

Get status of PSIG proxy.

**Parameters**

|     |                              |                                                        |
|-----|------------------------------|--------------------------------------------------------|
| in  | <i>PsigId</i>                | proxy_id (range [0, 40]) of PSIG proxy                 |
| out | <i>Psig-Connection-State</i> | status of connection                                   |
| out | <i>NoOfStreams</i>           | number of open streams on connection                   |
| out | <i>Current-Bandwidth</i>     | total bandwidth of all PSI currently imported via PSIG |
| out | <i>Connection-Peer</i>       | IP address of connected PSIG                           |

**Exceptions**

|                         |                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i>   | internal error only                                                                                      |
| <i>InvalidSelection</i> | invalid EisId                                                                                            |
| <i>OpNotAllowed</i>     | not logged on                                                                                            |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or when call not yet supported on running software version |
| <i>OutOfRange</i>       | when parameters invalid (e.g. peer has IPv6 address)                                                     |

**Version**

release 2.0

**Deprecated** This call should not be used anymore since release 10.10 (replaced by call GetPsigStatus\_V2)

**8.62.4.62** void DCM::DeviceControl::GetPsigStatus\_V2 ( in unsigned long *PsigId*, out eConnectionState *PsigConnectionState*, out unsigned long *NoOfStreams*, out unsigned long *CurrentBandwidth*, out string *ConnectionPeer* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

Get status of PSIG proxy.

**Parameters**

|     |                              |                                                        |
|-----|------------------------------|--------------------------------------------------------|
| in  | <i>PsigId</i>                | proxy_id (range [0, 40]) of PSIG proxy                 |
| out | <i>Psig-Connection-State</i> | status of connection                                   |
| out | <i>NoOfStreams</i>           | number of open streams on connection                   |
| out | <i>Current-Bandwidth</i>     | total bandwidth of all PSI currently imported via PSIG |
| out | <i>Connection-Peer</i>       | IP address of connected PSIG                           |

**Exceptions**

|                         |                                           |
|-------------------------|-------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing |
| <i>OpNotSucceeded</i>   | internal error only                       |
| <i>InvalidSelection</i> | invalid EisId                             |

|                       |                                                                                                          |
|-----------------------|----------------------------------------------------------------------------------------------------------|
| <i>OpNotAllowed</i>   | not logged on                                                                                            |
| <i>OpNotSupported</i> | when called on other board than the mainboard or when call not yet supported on running software version |
| <i>OutOfRange</i>     | when parameters invalid (e.g. peer has IPv6 address)                                                     |

**Version**

release 10.10

**8.62.4.63** void DCM::DeviceControl::GetScsSettings ( out boolean *ScrambleOnlyAV*, out boolean *CheckElementsAtProvisionTime*, out unsigned long *ScgAcceptDelay* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get global SCS settings.

**Parameters**

|     |                                       |                                          |
|-----|---------------------------------------|------------------------------------------|
| out | <i>ScrambleOnly-AV</i>                | scramble only audio and video            |
| out | <i>Check-ElementsAt-ProvisionTime</i> | check SCG at provision time              |
| out | <i>ScgAccept-Delay</i>                | minimum delay to accept SCG after reboot |

**Exceptions**

|                       |                                                                                                          |
|-----------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i> | internal error only                                                                                      |
| <i>OpNotAllowed</i>   | not logged on                                                                                            |
| <i>OpNotSupported</i> | when called on other board than the mainboard or when call not yet supported on running software version |

**Version**

release 2.0

**8.62.4.64** void DCM::DeviceControl::IsScrambler ( out boolean *bScrambler* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Notifies the client whether it is a scrambler or not.

**Parameters**

|     |                   |                  |
|-----|-------------------|------------------|
| out | <i>bScrambler</i> | scrambler or not |
|-----|-------------------|------------------|

**Exceptions**

|                       |                                           |
|-----------------------|-------------------------------------------|
| <i>TimeOut</i>        | a timeout occurred during IIOP processing |
| <i>OpNotSucceeded</i> | internal error only                       |
| <i>OpNotAllowed</i>   | not logged on                             |

|                       |                                                                                                          |
|-----------------------|----------------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | when called on other board than the mainboard or when call not yet supported on running software version |
|-----------------------|----------------------------------------------------------------------------------------------------------|

**Version**

release 2.0

**8.62.4.65** void DCM::DeviceControl::RevertNow ( in unsigned long *EcmgId* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported)

???

**Parameters**

|    |               |                                        |
|----|---------------|----------------------------------------|
| in | <i>EcmgId</i> | proxy_id (range [0, 40]) of ECMG proxy |
|----|---------------|----------------------------------------|

**Exceptions**

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                      |
| <i>OpNotSucceeded</i>   | internal error only                                                                            |
| <i>InvalidSelection</i> | invalid EcmgId                                                                                 |
| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |

**Note**

Not supported!!!

**8.62.4.66** void DCM::DeviceControl::SetClearStrongPairingEnforceBit ( in boolean *bClearStrongPairingEnforcementBit* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)

Set strong pairing enforcement bit clear flag (NDS specific).

**Parameters**

|    |                                           |                                                           |
|----|-------------------------------------------|-----------------------------------------------------------|
| in | <i>bClearStrongPairing-EnforcementBit</i> | indicate whether to clear bit in CW or not (range [0, 1]) |
|----|-------------------------------------------|-----------------------------------------------------------|

**Exceptions**

|                       |                                                                                                          |
|-----------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i> | internal error only                                                                                      |
| <i>OpNotAllowed</i>   | not logged on                                                                                            |
| <i>OpNotSupported</i> | when called on other board than the mainboard or when call not yet supported on running software version |
| <i>OutOfRange</i>     | when parameters invalid                                                                                  |

**Version**

release 5.5

**8.62.4.67** void DCM::DeviceControl::SetCwgConfig ( in unsigned long *CwgId*, in string *Name*, in eCwgType *Type*, in unsigned short *CasId*, in unsigned short *SubCasId*, in eCwgChannelIdMode *ChannelIdMode* ) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

Set CWG proxy configuration settings.

**Parameters**

|    |                       |                                              |
|----|-----------------------|----------------------------------------------|
| in | <i>CwgId</i>          | proxy_id (range [0, 40]) of CWG proxy        |
| in | <i>Name</i>           | name of CWG proxy (length max 20 characters) |
| in | <i>Type</i>           | type of CWG proxy                            |
| in | <i>CasId</i>          | CA_system_id of CWG                          |
| in | <i>SubCasId</i>       | CA_subsystem_id of CWG                       |
| in | <i>ChannelId-Mode</i> | CWG channel_id selection mode                |

**Exceptions**

|                         |                                                                                           |
|-------------------------|-------------------------------------------------------------------------------------------|
| <i>Timeout</i>          | a timeout occurred during IIOP processing                                                 |
| <i>OpNotSucceeded</i>   | internal error only                                                                       |
| <i>InvalidSelection</i> | invalid CwgId or parameter                                                                |
| <i>OpNotAllowed</i>     | not logged on                                                                             |
| <i>OpNotSupported</i>   | called on other board than the mainboard or not yet supported on running software version |
| <i>OutOfRange</i>       | when parameters invalid                                                                   |

**Version**

release 9.0

**8.62.4.68** void DCM::DeviceControl::SetCwgConnConfig ( in unsigned long *CwgId*, in unsigned long *ConnId*, in unsigned long *IpAddress*, in unsigned short *Port*, in unsigned short *ChannelId*, in long *Priority* ) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

Set connection (channel) configuration settings.

**Parameters**

|    |                  |                                                              |
|----|------------------|--------------------------------------------------------------|
| in | <i>CwgId</i>     | proxy_id (range [0, 40]) of CWG proxy                        |
| in | <i>ConnId</i>    | conn_id of connection (channel)                              |
| in | <i>IpAddress</i> | IP address of CWG to connect with (range [0, 0xffffffff])    |
| in | <i>Port</i>      | port on CWG to establish connection on (range [100, 0xffff]) |
| in | <i>ChannelId</i> | channel_id to be used (for manual mode)                      |
| in | <i>Priority</i>  | priority of connection (for backup and load balancing)       |

**Exceptions**

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                      |
| <i>OpNotSucceeded</i>   | internal error only                                                                            |
| <i>InvalidSelection</i> | invalid CwgId, ConnId                                                                          |
| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |
| <i>OutOfRange</i>       | when parameters invalid                                                                        |

**Version**

release 9.0

**Deprecated** This call should not be used anymore since release 10.10 (replaced by call SetCwgConn-Config\_V2)

**8.62.4.69** void DCM::DeviceControl::SetCwgConnConfig\_V2 ( in unsigned long *CwgId*, in unsigned long *ConnId*, in string *IpAddress*, in unsigned short *Port*, in unsigned short *ChannelId*, in long *Priority* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

Set connection (channel) configuration settings.

**Parameters**

|    |                  |                                                              |
|----|------------------|--------------------------------------------------------------|
| in | <i>CwgId</i>     | proxy_id (range [0, 40]) of CWG proxy                        |
| in | <i>ConnId</i>    | conn_id of connection (channel)                              |
| in | <i>IpAddress</i> | IP address of CWG to connect with                            |
| in | <i>Port</i>      | port on CWG to establish connection on (range [100, 0xffff]) |
| in | <i>ChannelId</i> | channel_id to be used (for manual mode)                      |
| in | <i>Priority</i>  | priority of connection (for backup and load balancing)       |

**Exceptions**

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                      |
| <i>OpNotSucceeded</i>   | internal error only                                                                            |
| <i>InvalidSelection</i> | invalid CwgId, ConnId                                                                          |
| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |
| <i>OutOfRange</i>       | when parameters invalid                                                                        |

**Version**

release 10.10

**8.62.4.70** void DCM::DeviceControl::SetCwgOverride ( in unsigned long *CwgId*, in boolean *OverrideMaxCompTime*, in short *MaxCompTime*, in boolean *OverrideMaxStreams*, in unsigned short *MaxStreams* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

Set CWG proxy advanced settings.

**Parameters**

|    |                             |                                                              |
|----|-----------------------------|--------------------------------------------------------------|
| in | <i>CwgId</i>                | proxy_id (range [0, 40]) of CWG proxy                        |
| in | <i>OverrideMax-CompTime</i> | flag to override max_comp_time (range [0, 1])                |
| in | <i>MaxCompTime</i>          | overruled value for max_comp_time (in ms) (range [0, 60000]) |
| in | <i>OverrideMax-Streams</i>  | flag to override max_streams (range [0, 1])                  |
| in | <i>MaxStreams</i>           | overruled value for max_streams (range [0, 80])              |

**Exceptions**

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                      |
| <i>OpNotSucceeded</i>   | internal error only                                                                            |
| <i>InvalidSelection</i> | invalid CwgId                                                                                  |
| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |
| <i>OutOfRange</i>       | when parameters invalid                                                                        |

**Version**

release 9.0

**8.62.4.71** void DCM::DeviceControl::SetDeviceAsBackup ( in boolean *bIsBackup* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)

Set the device (DCM) as backup device or not.

**Parameters**

|    |                  |                                             |
|----|------------------|---------------------------------------------|
| in | <i>bIsBackup</i> | device becomes backup or not (range [0, 1]) |
|----|------------------|---------------------------------------------|

**Exceptions**

|                       |                                                                                                          |
|-----------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i> | internal error only                                                                                      |
| <i>OpNotAllowed</i>   | not logged on                                                                                            |
| <i>OpNotSupported</i> | when called on other board than the mainboard or when call not yet supported on running software version |
| <i>OutOfRange</i>     | when parameters invalid                                                                                  |

**Version**

release 2.5

**Deprecated** This call should not be used anymore since release 4.0. Instead, SetDeviceActiveMode should be used.

**8.62.4.72** void DCM::DeviceControl::SetEcmgBackup ( in unsigned long *EcmgId*, in boolean *BackupRevertive*, in long *RevertTime*, in boolean *HotStandby* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

Set ECMG backup settings (obsolete!).

**Parameters**

|    |                         |                                        |
|----|-------------------------|----------------------------------------|
| in | <i>EcmgId</i>           | proxy_id (range [0, 40]) of ECMG proxy |
| in | <i>Backup-Revertive</i> | ??? (range [0,1])                      |
| in | <i>RevertTime</i>       | ??? (in sec) (range [0, 60])           |
| in | <i>HotStandby</i>       | ??? (range [0, 1])                     |

**Exceptions**

| <i>OutOfRange</i>       | when parameters invalid                                                                   |

### Version

release 2.0

**Deprecated** This call should not be used anymore since release 8.9 (replaced by call SetEcmgConfig\_V2)

**8.62.4.74** void DCM::DeviceControl::SetEcmgConfig\_V2 ( in unsigned long *EcmgId*, in string *Name*, in eEcmgType\_V2 *EcmgType*, in unsigned short *CasId*, in unsigned short *SubCasId*, in eEcmPidSource *EcmPidSource*, in unsigned short *EcmPidLowerLimit*, in unsigned short *EcmPidUpperLimit*, in eEcmgChannelIdMode *EcmgChannelIdMode* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

Set ECMG proxy configuration settings.

### Parameters

|    |                          |                                                                          |
|----|--------------------------|--------------------------------------------------------------------------|
| in | <i>EcmgId</i>            | proxy_id (range [0, 40]) of ECMG proxy                                   |
| in | <i>Name</i>              | name of ECMG proxy (length max 20 characters)                            |
| in | <i>EcmgType</i>          | type of ECMG proxy                                                       |
| in | <i>CasId</i>             | CA_system_id of ECMG                                                     |
| in | <i>SubCasId</i>          | CA_subsystem_id of ECMG                                                  |
| in | <i>EcmPidSource</i>      | ECM pid source                                                           |
| in | <i>EcmPidLowerLimit</i>  | lower limit for ECM pid selection (for auto mode) (range [0x20, 0x1fff]) |
| in | <i>EcmPidUpperLimit</i>  | upper limit for ECM pid selection (for auto mode) (range [0x20, 0x1fff]) |
| in | <i>EcmgChannelIdMode</i> | ECMG channel_id selection mode                                           |

### Exceptions

|                         |                                           |
|-------------------------|-------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing |
| <i>OpNotSucceeded</i>   | internal error only                       |
| <i>InvalidSelection</i> | invalid EcmgId or parameter               |

|                       |                                                                                           |
|-----------------------|-------------------------------------------------------------------------------------------|
| <i>OpNotAllowed</i>   | not logged on                                                                             |
| <i>OpNotSupported</i> | called on other board than the mainboard or not yet supported on running software version |
| <i>OutOfRange</i>     | when parameters invalid                                                                   |

### Version

release 8.9 - PowerVu type behaves as Standard ECMG  
release 9.0

**8.62.4.75** void DCM::DeviceControl::SetEcmgConnConfig ( in unsigned long *EcmgId*, in unsigned long *ConnId*, in unsigned long *IpAddress*, in unsigned short *Port*, in unsigned short *ChannelId*, in long *Priority* ) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

Set connection (channel) configuration settings.

### Parameters

|    |                  |                                                               |
|----|------------------|---------------------------------------------------------------|
| in | <i>EcmgId</i>    | proxy_id (range [0, 40[) of ECMG proxy                        |
| in | <i>ConnId</i>    | conn_id of connection (channel)                               |
| in | <i>IpAddress</i> | IP address of ECMG to connect with (range ]0, 0xffffffff])    |
| in | <i>Port</i>      | port on ECMG to establish connection on (range [100, 0xffff]) |
| in | <i>ChannelId</i> | channel_id to be used (for manual mode)                       |
| in | <i>Priority</i>  | priority of connection (for backup and load balancing)        |

### Exceptions

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>Timeout</i>          | a timeout occurred during IIOP processing                                                      |
| <i>OpNotSucceeded</i>   | internal error only                                                                            |
| <i>InvalidSelection</i> | invalid EcmgId, ConnId                                                                         |
| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |
| <i>OutOfRange</i>       | when parameters invalid                                                                        |

### Version

release 2.0

**Deprecated** This call should not be used anymore since release 10.10 (replaced by call SetEcmgConnConfig\_V2)

**8.62.4.76** void DCM::DeviceControl::SetEcmgConnConfig\_V2 ( in unsigned long *EcmgId*, in unsigned long *ConnId*, in string *IpAddress*, in unsigned short *Port*, in unsigned short *ChannelId*, in long *Priority* ) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

Set connection (channel) configuration settings.

**Parameters**

|    |                  |                                                               |
|----|------------------|---------------------------------------------------------------|
| in | <i>EcmgId</i>    | proxy_id (range [0, 40]) of ECMG proxy                        |
| in | <i>ConnId</i>    | conn_id of connection (channel)                               |
| in | <i>IPAddress</i> | IP address of ECMG to connect with                            |
| in | <i>Port</i>      | port on ECMG to establish connection on (range [100, 0xffff]) |
| in | <i>ChannelId</i> | channel_id to be used (for manual mode)                       |
| in | <i>Priority</i>  | priority of connection (for backup and load balancing)        |

**Exceptions**

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>Timeout</i>          | a timeout occurred during IIOP processing                                                      |
| <i>OpNotSucceeded</i>   | internal error only                                                                            |
| <i>InvalidSelection</i> | invalid EcmgId, ConnId                                                                         |
| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |
| <i>OutOfRange</i>       | when parameters invalid                                                                        |

**Version**

release 10.10

**8.62.4.77** void DCM::DeviceControl::SetEcmgDescriptor ( in unsigned long *EcmgId*, in unsigned long *DescRuleId*, in string *DescRuleName*, in eEcmgDescRuleType *Type*, in eDescInsertionLevel *InsertionLevel*, in string *DescriptorData*, in EcmgIdList *EcmlDs* ) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

Set descriptor rule (on ECMG proxy) configuration settings.

**Parameters**

|    |                       |                                                                             |
|----|-----------------------|-----------------------------------------------------------------------------|
| in | <i>EcmgId</i>         | proxy_id (range [0, 40]) of ECMG proxy                                      |
| in | <i>DescRuleId</i>     | desc_rule_id of descriptor rule                                             |
| in | <i>DescRuleName</i>   | name of descriptor rule (length max 30 characters)                          |
| in | <i>Type</i>           | type of descriptor rule ('add private data' or 'do not insert')             |
| in | <i>InsertionLevel</i> | insertion level of descriptor                                               |
| in | <i>DescriptorData</i> | extra (private) data to append to descriptor (length of data max 100 bytes) |
| in | <i>EcmlDs</i>         | list of EcmgId's where descriptor rule applies to                           |

**Exceptions**

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>Timeout</i>          | a timeout occurred during IIOP processing                                                      |
| <i>OpNotSucceeded</i>   | internal error only                                                                            |
| <i>InvalidSelection</i> | invalid EcmgId, DescRuleId                                                                     |
| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |
| <i>OutOfRange</i>       | when parameters invalid                                                                        |

**Remarks**

descriptor string format: hex byte array possible future extentions:

- EcmPid: inserts 13 bit ECM pid (preceeded by hex nibble E of which one bit is overwritten)
- EcmId: inserts 16 bits EcmId
- CasId: inserts 16 bits CasId

**Version**

release 2.0

**Deprecated** This call should not be used anymore since release 8.1 (replaced by call SetEcmgDescriptor\_V2)

**8.62.4.78** void DCM::DeviceControl::SetEcmgDescriptor\_V2 ( in unsigned long *EcmgId*, in unsigned long *DescRuleId*, in string *DescRuleName*, in eEcmgDescRuleType *Type*, in eDescInsertionLevel\_V2 *InsertionLevel*, in string *DescriptorData*, in EcmIdList *EcmIds* ) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

Set descriptor rule (on ECMG proxy) configuration settings.

**Parameters**

|    |                       |                                                                             |
|----|-----------------------|-----------------------------------------------------------------------------|
| in | <i>EcmgId</i>         | proxy_id (range [0, 40]) of ECMG proxy                                      |
| in | <i>DescRuleId</i>     | desc_rule_id of descriptor rule                                             |
| in | <i>DescRuleName</i>   | name of descriptor rule (length max 30 characters)                          |
| in | <i>Type</i>           | type of descriptor rule ('add private date' or 'do not insert')             |
| in | <i>InsertionLevel</i> | insertion level of descriptor                                               |
| in | <i>DescriptorData</i> | extra (private) data to append to descriptor (length of data max 100 bytes) |
| in | <i>EcmIds</i>         | list of EcmId's where descriptor rule applies to                            |

**Exceptions**

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>Timeout</i>          | a timeout occurred during IIOP processing                                                      |
| <i>OpNotSucceeded</i>   | internal error only                                                                            |
| <i>InvalidSelection</i> | invalid EcmgId, DescRuleId                                                                     |
| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |
| <i>OutOfRange</i>       | when parameters invalid                                                                        |

**Remarks**

descriptor string format: hex byte array possible future extentions:

- EcmPid: inserts 13 bit ECM pid (preceeded by hex nibble E of which one bit is overwritten)
- EcmId: inserts 16 bits EcmId
- CasId: inserts 16 bits CasId

**Version**

release 8.1

**8.62.4.79** void DCM::DeviceControl::SetEcmgNotifyCPExtension ( in unsigned long *EcmgId*, in boolean *NotifyCPExtension* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

Set ECMG notify CP extension.

**Parameters**

|    |                           |                                                                    |
|----|---------------------------|--------------------------------------------------------------------|
| in | <i>EcmgId</i>             | proxy_id (range [0, 40[) of ECMG proxy                             |
| in | <i>NotifyCP-Extension</i> | enable/disable CP extension notification (range [0, 1], default 0) |

**Exceptions**

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                      |
| <i>OpNotSucceeded</i>   | internal error only                                                                            |
| <i>InvalidSelection</i> | invalid EcmgId                                                                                 |
| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |
| <i>OutOfRange</i>       | when parameters invalid                                                                        |

**Version**

release 8.9

**8.62.4.80** void DCM::DeviceControl::SetEcmgOverride ( in unsigned long *EcmgId*, in boolean *OverrideMaxCompTime*, in short *MaxCompTime*, in boolean *OverrideMinimumCPDuration*, in unsigned long *MinimumCPDuration*, in boolean *OverrideTransitionStartDelay*, in short *TransitionStartDelay*, in boolean *OverrideTransitionStopDelay*, in short *TransitionStopDelay*, in boolean *OverrideStartDelay*, in short *StartDelay*, in boolean *OverrideStopDelay*, in short *StopDelay*, in boolean *OverrideAcStartDelay*, in short *AcStartDelay*, in boolean *OverrideAcStopDelay*, in short *AcStopDelay* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

Set ECMG proxy advanced settings (part 1).

**Parameters**

|    |                                    |                                                                     |
|----|------------------------------------|---------------------------------------------------------------------|
| in | <i>EcmgId</i>                      | proxy_id (range [0, 40[) of ECMG proxy                              |
| in | <i>OverrideMax-CompTime</i>        | flag to override max_comp_time (range [0, 1])                       |

| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |
| <i>OutOfRange</i>       | when parameters invalid                                                                        |

### Version

release 2.0

**8.62.4.81** void DCM::DeviceControl::SetEcmgOverrideExt ( in unsigned long *EcmgId*, in boolean *OverrideMaxStreams*, in unsigned short *MaxStreams*, in boolean *OverrideEcmRepPeriod*, in unsigned short *EcmRepPeriod* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

Set ECMG proxy advanced settings (part 2).

### Parameters

|    |                              |                                                               |
|----|------------------------------|---------------------------------------------------------------|
| in | <i>EcmgId</i>                | proxy_id (range [0, 40]) of ECMG proxy                        |
| in | <i>OverrideMax-Streams</i>   | flag to override max_streams (range [0, 1])                   |
| in | <i>MaxStreams</i>            | overruled value for max_streams (range [0, 80])               |
| in | <i>OverrideEcm-RepPeriod</i> | flag to override ECM_rep_period (range [0, 1])                |
| in | <i>EcmRepPeriod</i>          | overruled value for ECM_rep_period (in ms) (range [0, 30000]) |

**Exceptions**

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                      |
| <i>OpNotSucceeded</i>   | internal error only                                                                            |
| <i>InvalidSelection</i> | invalid EcmgId                                                                                 |
| <i>OpNotAllowed</i>     | not logged on                                                                                  |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or not yet supported on running software version |
| <i>OutOfRange</i>       | when parameters invalid                                                                        |

**Version**

release 2.0

**8.62.4.82** void DCM::DeviceControl::SetEisConfig ( in unsigned long *EisId*, in string *Name*, in eEisType *EisType*, in unsigned short *TcpPort*, in boolean *OverrideRecommendedCpDuration*, in unsigned long *RecommendedCpDuration* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

Set EIS proxy configuration settings.

**Parameters**

|    |                                        |                                                                                |
|----|----------------------------------------|--------------------------------------------------------------------------------|
| in | <i>EisId</i>                           | proxy_id (range [0, 40]) of EIS proxy                                          |
| in | <i>Name</i>                            | name of EIS proxy (length max 20 characters)                                   |
| in | <i>EisType</i>                         | type of EIS proxy                                                              |
| in | <i>TcpPort</i>                         | TCP port where to listen for EIS                                               |
| in | <i>Override-Recommended-CpDuration</i> | flag to override recommended_CP_duration (range [0, 1])                        |
| in | <i>Recommended-CpDuration</i>          | overruled value for recommended_CP_duration (in ms) (range [0x00, 0x7fffffff]) |

**Exceptions**

|                         |                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i>   | internal error only                                                                                      |
| <i>InvalidSelection</i> | invalid EisId                                                                                            |
| <i>OpNotAllowed</i>     | not logged on                                                                                            |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or when call not yet supported on running software version |
| <i>OutOfRange</i>       | when parameters invalid                                                                                  |

**Version**

release 2.0

**8.62.4.83** void DCM::DeviceControl::SetEmmgConfig ( in unsigned long *EmmgId*, in string *Name*, in long *ClientId*, in eDataSocket *DataSocket*, in unsigned short *TcpPort*, in unsigned short *UdpPort*, in unsigned long *MaxBandwidth*, in eEmmPidSource *EmmPidSource*, in unsigned short *EmmPidLowerLimit*, in unsigned short *EmmPidUpperLimit*, in eEmmSectionGrouping *SectionGrouping* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

Set EMMG proxy configuration settings.

**Parameters**

|    |                         |                                                                          |
|----|-------------------------|--------------------------------------------------------------------------|
| in | <i>EmmgId</i>           | proxy_id (range [0, 40]) of EMMG proxy                                   |
| in | <i>Name</i>             | name of EMMG proxy (length max 50 characters)                            |
| in | <i>ClientId</i>         | client_id of EMMG (range [-1, 0x7fff])                                   |
| in | <i>DataSocket</i>       | type of data for socket (TCP or UDP)                                     |
| in | <i>TcpPort</i>          | TCP port where to listen for EMMG                                        |
| in | <i>UdpPort</i>          | UDP port where to listen for EMMG                                        |
| in | <i>MaxBandwidth</i>     | maximum bandwidth to be used for EMM (in bps) (range [0, 5000000])       |
| in | <i>EmmPidSource</i>     | EMM pid source (stream_id, channel_id, data_id, packet_id or auto)       |
| in | <i>EmmPidLowerLimit</i> | lower limit for EMM pid selection (for auto mode) (range [0x00, 0x1fff]) |
| in | <i>EmmPidUpperLimit</i> | upper limit for EMM pid selection (for auto mode) (range [0x00, 0x1fff]) |
| in | <i>SectionGrouping</i>  | enable/disable section frouping for EMM's (range [0, 1])                 |

**Remarks**

ClientId 0 for don't care

MaxBandwidth triggers only alarm, no specific enforcing beyond the total output bandwidth limit

**Exceptions**

|                         |                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i>   | internal error only                                                                                      |
| <i>InvalidSelection</i> | invalid EmmgId                                                                                           |
| <i>OpNotAllowed</i>     | not logged on                                                                                            |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or when call not yet supported on running software version |
| <i>OutOfRange</i>       | when parameters invalid                                                                                  |

**Version**

release 2.0

**8.62.4.84** void DCM::DeviceControl::SetEmmgDescriptor ( in unsigned long *EmmgId*, in unsigned long *DescRuleId*, in string *DescRuleName*, in eEmmgDescRuleType *Type*, in string *DescriptorData*, in DataIdList *DataIds* ) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

Set descriptor rule (on EMMG proxy) configuration settings.

**Parameters**

|    |                       |                                                                             |
|----|-----------------------|-----------------------------------------------------------------------------|
| in | <i>EmmgId</i>         | proxy_id (range [0, 40]) of EMMG proxy                                      |
| in | <i>DescRuleId</i>     | desc_rule_id of descriptor rule                                             |
| in | <i>DescRuleName</i>   | name of descriptor rule (length max 30 characters)                          |
| in | <i>Type</i>           | type of descriptor rule ('add private data' or 'do no insert')              |
| in | <i>DescriptorData</i> | extra (private) data to append to descriptor (length of data max 100 bytes) |
| in | <i>DataIds</i>        | list of DataId's where descriptor rule applies to                           |

**Exceptions**

|                         |                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------|
| <i>Timeout</i>          | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i>   | internal error only                                                                                      |
| <i>InvalidSelection</i> | invalid EmmgId, DescRuleId                                                                               |
| <i>OpNotAllowed</i>     | not logged on                                                                                            |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or when call not yet supported on running software version |
| <i>OutOfRange</i>       | when parameters invalid                                                                                  |

**Version**

release 2.0

**8.62.4.85** void DCM::DeviceControl::SetHotEcmgConnection ( in unsigned long *EcmgId*, in boolean *bBackupHotStandby* ) raises (Timeout, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

Set ECMG hot connection backup setting(override ECMG disconnection).

**Parameters**

|    |                          |                                                                         |
|----|--------------------------|-------------------------------------------------------------------------|
| in | <i>EcmgId</i>            | proxy_id (range [0, 40]) of ECMG proxy                                  |
| in | <i>bBackupHotStandby</i> | flag to indicate if hot ECMG connection backup is needed (range [0, 1]) |

**Exceptions**

|                         |                                           |
|-------------------------|-------------------------------------------|
| <i>Timeout</i>          | a timeout occurred during IIOP processing |
| <i>OpNotSucceeded</i>   | internal error only                       |
| <i>InvalidSelection</i> | invalid EcmgId                            |
| <i>OpNotAllowed</i>     | not logged on                             |

|                       |                                                                                                |
|-----------------------|------------------------------------------------------------------------------------------------|
| <i>OpNotSupported</i> | when called on other board than the mainboard or not yet supported on running software version |
| <i>OutOfRange</i>     | when parameters invalid                                                                        |

**Remarks**

non-active **DCM** will set up connection to ECMG, except if hot connection backup is disabled.

**Version**

release 2.5

**8.62.4.86** void DCM::DeviceControl::SetJclConfig ( in JclInitialValue\_t *InitialValue*, in JclSystemId\_t *SystemId* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set JCL configuration.

**Parameters**

|    |                     |                   |
|----|---------------------|-------------------|
| in | <i>InitialValue</i> | JCL initial value |
| in | <i>SystemId</i>     | JCL system ID     |

**Exceptions**

|                       |                                                                                                          |
|-----------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i> | internal error                                                                                           |
| <i>OpNotAllowed</i>   | not logged on                                                                                            |
| <i>OpNotSupported</i> | when called on other board than the mainboard or when call not yet supported on running software version |

**Version**

release 2.0

**Note**

JCL scrambling not yet supported

**8.62.4.87** void DCM::DeviceControl::SetPsigConfig ( in unsigned long *PsigId*, in string *Name*, in ePsigType *PsigType*, in unsigned short *TcpPort*, in unsigned long *MaxBandwidth* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

Set PSIG proxy configuration settings.

**Parameters**

|    |                     |                                                                    |
|----|---------------------|--------------------------------------------------------------------|
| in | <i>PsigId</i>       | proxy_id (range [0, 40]) of PSIG proxy                             |
| in | <i>Name</i>         | name of PSIG proxy (length max 20 characters)                      |
| in | <i>PsigType</i>     | type of PSIG proxy                                                 |
| in | <i>TcpPort</i>      | TCP port where to listen for PSIG                                  |
| in | <i>MaxBandwidth</i> | maximum bandwidth to be used for PSI (in bps) (range [0, 2000000]) |

**Remarks**

MaxBandwidth triggers only alarm, no specific enforcing beyond the total output bandwidth limit

**Exceptions**

|                         |                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i>   | internal error only                                                                                      |
| <i>InvalidSelection</i> | invalid EisId                                                                                            |
| <i>OpNotAllowed</i>     | not logged on                                                                                            |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or when call not yet supported on running software version |
| <i>OutOfRange</i>       | when parameters invalid                                                                                  |

**Version**

release 2.0

**8.62.4.88** void DCM::DeviceControl::SetPsigConfig2 ( in unsigned long *PsigId*, in string *Name*, in ePsigType *PsigType*, in unsigned short *TcpPort*, in unsigned long *MaxBandwidth*, in boolean *DoNotModify* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

Set PSIG proxy configuration settings.

**Parameters**

|    |                     |                                                                                                            |
|----|---------------------|------------------------------------------------------------------------------------------------------------|
| in | <i>PsigId</i>       | proxy_id (range [0, 40[) of PSIG proxy                                                                     |
| in | <i>Name</i>         | name of PSIG proxy (length max 20 characters)                                                              |
| in | <i>PsigType</i>     | type of PSIG proxy                                                                                         |
| in | <i>TcpPort</i>      | TCP port where to listen for PSIG                                                                          |
| in | <i>MaxBandwidth</i> | maximum bandwidth to be used for PSI (in bps) (range [0, 2000000])                                         |
| in | <i>DoNotModify</i>  | If set, tables imported on this proxy will be played out exactly as received, without changing any fields. |

**Remarks**

MaxBandwidth triggers only alarm, no specific enforcing beyond the total output bandwidth limit

**Exceptions**

|                         |                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i>   | internal error only                                                                                      |
| <i>InvalidSelection</i> | invalid EisId                                                                                            |
| <i>OpNotAllowed</i>     | not logged on                                                                                            |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or when call not yet supported on running software version |
| <i>OutOfRange</i>       | when parameters invalid                                                                                  |

**Version**

release 7.0

**8.62.4.89** void DCM::DeviceControl::SetPsigConfig3 ( in unsigned long *PsigId*, in string *Name*, in ePsigType *PsigType*, in unsigned short *TcpPort*, in unsigned long *MaxBandwidth*, in boolean *DoNotModify*, in boolean *AllowMultipleNITa* ) raises (TimeOut, OpNotSucceeded, InvalidSelection, OpNotAllowed, OpNotSupported, OutOfRange)

Set PSIG proxy configuration settings.

**Parameters**

|    |                           |                                                                                                            |
|----|---------------------------|------------------------------------------------------------------------------------------------------------|
| in | <i>PsigId</i>             | proxy_id (range [0, 40]) of PSIG proxy                                                                     |
| in | <i>Name</i>               | name of PSIG proxy (length max 20 characters)                                                              |
| in | <i>PsigType</i>           | type of PSIG proxy                                                                                         |
| in | <i>TcpPort</i>            | TCP port where to listen for PSIG                                                                          |
| in | <i>MaxBandwidth</i>       | maximum bandwidth to be used for PSI (in bps) (range [0, 2000000])                                         |
| in | <i>DoNotModify</i>        | If set, tables imported on this proxy will be played out exactly as received, without changing any fields. |
| in | <i>AllowMultiple-NITa</i> | If set, more than one NITa can be provisioned for the same TS                                              |

**Remarks**

MaxBandwidth triggers only alarm, no specific enforcing beyond the total output bandwidth limit

**Exceptions**

|                         |                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>          | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i>   | internal error only                                                                                      |
| <i>InvalidSelection</i> | invalid EisId                                                                                            |
| <i>OpNotAllowed</i>     | not logged on                                                                                            |
| <i>OpNotSupported</i>   | when called on other board than the mainboard or when call not yet supported on running software version |
| <i>OutOfRange</i>       | when parameters invalid                                                                                  |

**Version**

release 9.0

**8.62.4.90** void DCM::DeviceControl::SetScsSettings ( in boolean *ScrambleOnlyAV*, in boolean *CheckElementsAtProvisionTime*, in unsigned long *ScgAcceptDelay* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported, OutOfRange)

Set global SCS settings.

**Parameters**

|    |                                       |                                              |
|----|---------------------------------------|----------------------------------------------|
| in | <i>ScrambleOnly-AV</i>                | scramble only audio and video (range [0, 1]) |
| in | <i>Check-ElementsAt-ProvisionTime</i> | check SCG at provision time (range [0, 1])   |

|    |                        |                                                                    |
|----|------------------------|--------------------------------------------------------------------|
| in | <i>ScgAccept-Delay</i> | minimum delay (in sec) to accept SCG after reboot (range [0, 120]) |
|----|------------------------|--------------------------------------------------------------------|

**Exceptions**

|                       |                                                                                                          |
|-----------------------|----------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | a timeout occurred during IIOP processing                                                                |
| <i>OpNotSucceeded</i> | internal error only                                                                                      |
| <i>OpNotAllowed</i>   | not logged on                                                                                            |

## 8.63 BISS scrambling

This module contains types, enums and methods related to BISS scrambling.

### Typedefs

- typedef sequence< unsigned short > [DCM::DeviceControl::PidList\\_t](#)

### Enumerations

- enum [DCM::DeviceControl::enEncryptionAlgorithm](#) { [DCM::DeviceControl::eCSA\\_Encryption](#), [DCM::DeviceControl::eDES\\_Encryption](#), [DCM::DeviceControl::eEncryptionAlgorithm\\_Reserved2](#), [DCM::DeviceControl::eEncryptionAlgorithm\\_Reserved3](#), [DCM::DeviceControl::eEncryptionAlgorithm\\_Reserved4](#), [DCM::DeviceControl::eEncryptionAlgorithm\\_Reserved5](#), [DCM::DeviceControl::eEncryptionAlgorithm\\_Reserved6](#), [DCM::DeviceControl::eEncryptionAlgorithm\\_Reserved7](#), [DCM::DeviceControl::eEncryptionAlgorithm\\_Reserved8](#), [DCM::DeviceControl::eEncryptionAlgorithm\\_Reserved9](#), [DCM::DeviceControl::eEncryptionAlgorithm\\_Reserved10](#) }

*Scrambling algorithm.*

- enum [DCM::DeviceControl::enScramblingAction](#) { [DCM::DeviceControl::eScrambling](#), [DCM::DeviceControl::eDescrambling](#) }

*Scrambling action.*

- enum [DCM::DeviceControl::enScramblingMode](#) { [DCM::DeviceControl::eDvbScrambling](#), [DCM::DeviceControl::eBissScrambling](#) }

*Scrambling mode.*

- enum [DCM::DeviceControl::enOperatingMode\\_t](#) { [DCM::DeviceControl::ePowerVu](#), [DCM::DeviceControl::ePowerVuSimulcrypt](#), [DCM::DeviceControl::eSimulcrypt](#), [DCM::DeviceControl::eOperatingMode\\_Reserved4](#), [DCM::DeviceControl::eOperatingMode\\_Reserved5](#) }

*Operating mode (PowerVu specific).*

### Functions

- void [DCM::DeviceControl::SCR\\_SetEncryptionAlgorithm](#) (in unsigned short BoardNr, in enEncryptionAlgorithm eEncryptionAlgorithm) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Set the encryption algorithm.*

- void [DCM::DeviceControl::SCR\\_GetEncryptionAlgorithm](#) (in unsigned short BoardNr, out enEncryptionAlgorithm eEncryptionAlgorithm) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the encryption algorithm.*

- void [DCM::DeviceControl::SCR\\_SetScramblingAction](#) (in unsigned short BoardNr, in enScramblingAction eScramblingAction) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Set the scrambling/descrambling mode.*

- void [DCM::DeviceControl::SCR\\_GetScramblingAction](#) (in unsigned short BoardNr, out enScramblingAction eScramblingAction) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the scrambling/descrambling mode.*

- void [DCM::DeviceControl::SCR\\_SetDefaultScramblingMode](#) (in unsigned short BoardNr, in enScramblingMode eScramblingMode) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Set the default scrambling mode.*

- void [DCM::DeviceControl::SCR\\_GetDefaultScramblingMode](#) (in unsigned short BoardNr, out enScramblingMode eScramblingMode) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the default scrambling mode.*

- void [DCM::DeviceControl::SCR\\_SetDefaultSessionWord](#) (in unsigned short BoardNr, in ByteStream SessionWord) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Set the default session word.*

- void [DCM::DeviceControl::SCR\\_GetDefaultSessionWord](#) (in unsigned short BoardNr, out ByteStream SessionWord, out boolean FollowDefault) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the default session word.*

- void [DCM::DeviceControl::SCR\\_SetDefaultParityBit](#) (in unsigned short BoardNr, in octet ParityBit) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Set the default parity bit.*

- void [DCM::DeviceControl::SCR\\_GetDefaultParityBit](#) (in unsigned short BoardNr, out octet ParityBit) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the default parity bit.*

- void [DCM::DeviceControl::SCR\\_SetDefaultOperatingMode](#) (in unsigned short BoardNr, in enOperatingMode\_t enOperatingMode) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Set the default operating mode.*

- void [DCM::DeviceControl::SCR\\_GetDefaultOperatingMode](#) (in unsigned short BoardNr, out enOperatingMode\_t enOperatingMode) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the default operating mode.*

- void [DCM::DeviceControl::SCR\\_SetScramblingMode](#) (in IPS\_RefTS\_t RefTS, in enScramblingMode eScramblingMode) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Set the scrambling mode on TS.*

- void [DCM::DeviceControl::SCR\\_GetScramblingMode](#) (in IPS\_RefTS\_t RefTS, out enScramblingMode eScramblingMode) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the scrambling mode on TS.*

- void [DCM::DeviceControl::SCR\\_SetSessionWord](#) (in IPS\_RefTS\_t RefTS, in ByteStream SessionWord) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Set the session word on TS.*

- void [DCM::DeviceControl::SCR\\_GetSessionWord](#) (in IPS\_RefTS\_t RefTS, out ByteStream SessionWord, out boolean FollowDefault) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the session word on TS.*

- void [DCM::DeviceControl::SCR\\_SetParityBit](#) (in IPS\_RefTS\_t RefTS, in octet ParityBit) raises (-Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Set the parity bit on TS.*

- void [DCM::DeviceControl::SCR\\_GetParityBit](#) (in IPS\_RefTS\_t RefTS, out octet ParityBit) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the parity bit on TS.*

- void [DCM::DeviceControl::SCR\\_SetOperatingMode](#) (in IPS\_RefTS\_t RefTS, in enOperatingMode\_t enOperatingMode) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Set the operating mode on TS.*

- void [DCM::DeviceControl::SCR\\_GetOperatingMode](#) (in IPS\_RefTS\_t RefTS, out enOperatingMode\_t enOperatingMode) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the operating mode on TS.*

- void [DCM::DeviceControl::SCR\\_StartBissScrambling](#) (in IPS\_RefTS\_t RefTS, in SidList\_t lstSIDs, in PidList\_t lstPIDs) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Start BISS scrambling/descrambling on a TS.*

- void [DCM::DeviceControl::SCR\\_StopBissScrambling](#) (in IPS\_RefTS\_t RefTS, in SidList\_t lstSIDs, in PidList\_t lstPIDs) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Stop BISS scrambling/descrambling on a TS.*

- void [DCM::DeviceControl::SCR\\_GetBissScrambled](#) (in IPS\_RefTS\_t RefTS, out SidList\_t lstSIDs, out PidList\_t lstPIDs) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get BISS scrambled/descrambled services on a TS.*

### 8.63.1 Detailed Description

This module contains types, enums and methods related to BISS scrambling.

### 8.63.2 Typedef Documentation

#### 8.63.2.1 typedef sequence<unsigned short> DCM::DeviceControl::PidList\_t

Definition at line 27117 of file DCM.idl.

### 8.63.3 Enumeration Type Documentation

#### 8.63.3.1 enum DCM::DeviceControl::enEncryptionAlgorithm

Scrambling algorithm.

#### Version

release 8.9

#### Enumerator:

**eCSA\_Encryption** CSA encryption.

**eDES\_Encryption** DES encryption.

**eEncryptionAlgorithm\_Reserved2** Reserved for future use.

**eEncryptionAlgorithm\_Reserved3** Reserved for future use.

**eEncryptionAlgorithm\_Reserved4** Reserved for future use.

**eEncryptionAlgorithm\_Reserved5** Reserved for future use.

**eEncryptionAlgorithm\_Reserved6** Reserved for future use.

**eEncryptionAlgorithm\_Reserved7** Reserved for future use.

**eEncryptionAlgorithm\_Reserved8** Reserved for future use.

**eEncryptionAlgorithm\_Reserved9** Reserved for future use.

**eEncryptionAlgorithm\_Reserved10** Reserved for future use.

Definition at line 27070 of file DCM.idl.

**8.63.3.2 enum DCM::DeviceControl::enOperatingMode\_t**

Operating mode (PowerVu specific).

**Version**

release 8.9 - only Simulcrypt mode supported  
release 9.0

**Enumerator:**

**ePowerVu** PowerVu Standard (as D9140 replacement)  
**ePowerVuSimulcrypt** PowerVu Simulcrypt.  
**eSimulcrypt** Simulcrypt.  
**eOperatingMode\_Reserved4** Reserved for future use.  
**eOperatingMode\_Reserved5** Reserved for future use.

Definition at line 27105 of file DCM.idl.

**8.63.3.3 enum DCM::DeviceControl::enScramblingAction**

Scrambling action.

**Enumerator:**

**eScrambling** Scrambling mode.  
**eDescrambling** Descrambling mode.

Definition at line 27086 of file DCM.idl.

**8.63.3.4 enum DCM::DeviceControl::enScramblingMode**

Scrambling mode.

**Enumerator:**

**eDvbScrambling** DVB Simulcrypt scrambling.  
**eBissScrambling** BISS scrambling (BISS mode 1 and fixed CW)

Definition at line 27093 of file DCM.idl.

**8.63.4 Function Documentation**

**8.63.4.1 void DCM::DeviceControl::SCR\_GetBissScrambled ( in IPS\_RefTS\_t RefTS, out SidList\_t lstSIDs, out PidList\_t lstPIDs ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)**

Get BISS scrambled/descrambled services on a TS.

**Parameters**

|     |         |                                                         |
|-----|---------|---------------------------------------------------------|
| in  | RefTS   | TS on which to apply call                               |
| out | lstSIDs | list of services (SID) configured for BISS scrambling   |
| out | lstPIDs | list of components (PID) configured for BISS scrambling |

Depending on the board level scrambling/descrambling mode, this will return all BISS scrambled or BISS descrambled services.

#### Note

The parameter `lstPIDs` is not used so far, but is just present to allow future extensions (supporting BISS-like component scrambling).

#### Exceptions

|                       |                                                                                                 |
|-----------------------|-------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | when it takes too long to handle the call                                                       |
| <i>OpNotSucceeded</i> | when a general failure occurs <ul style="list-style-type: none"> <li>• RefTS invalid</li> </ul> |
| <i>OpNotAllowed</i>   | when not logged on                                                                              |
| <i>OpNotSupported</i> | when called on mainboard or when call not supported yet on running software                     |

#### Version

release 6.0

release 8.0 - action will return BISS descrambled services as well

**8.63.4.2** void DCM::DeviceControl::SCR\_GetDefaultOperatingMode ( in unsigned short *BoardNr*, out *enOperatingMode\_t enOperatingMode* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the default operating mode.

#### Parameters

|     |                         |                                       |
|-----|-------------------------|---------------------------------------|
| in  | <i>BoardNr</i>          | board number on which to apply call   |
| out | <i>enOperating-Mode</i> | default operating mode on TS creation |

#### Exceptions

|                       |                                                                                                               |
|-----------------------|---------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | when it takes too long to handle the call                                                                     |
| <i>OpNotSucceeded</i> | when a general failure occurs <ul style="list-style-type: none"> <li>• BoardNr out of range [0, n]</li> </ul> |
| <i>OpNotAllowed</i>   | when not logged on                                                                                            |
| <i>OpNotSupported</i> | when called on mainboard or when call not supported yet on running software                                   |

#### Version

release 8.9

**8.63.4.3** void DCM::DeviceControl::SCR\_GetDefaultParityBit ( in unsigned short *BoardNr*, out octet *ParityBit* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the default parity bit.

**Parameters**

|     |                  |                                     |
|-----|------------------|-------------------------------------|
| in  | <i>BoardNr</i>   | board number on which to apply call |
| out | <i>ParityBit</i> | default parity bit on TS creation   |

**Exceptions**

|                       |                                                                                                             |
|-----------------------|-------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | when it takes too long to handle the call                                                                   |
| <i>OpNotSucceeded</i> | when a general failure occurs <ul style="list-style-type: none"> <li>BoardNr out of range [0, n]</li> </ul> |
| <i>OpNotAllowed</i>   | when not logged on                                                                                          |
| <i>OpNotSupported</i> | when called on mainboard or when call not supported yet on running software                                 |

**Version**

release 6.0

**8.63.4.4** void DCM::DeviceControl::SCR\_GetDefaultScramblingMode ( in unsigned short *BoardNr*, out enScramblingMode *eScramblingMode* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the default scrambling mode.

**Parameters**

|     |                         |                                        |
|-----|-------------------------|----------------------------------------|
| in  | <i>BoardNr</i>          | board number on which to apply call    |
| out | <i>eScrambling-Mode</i> | default scrambling mode on TS creation |

**Exceptions**

|                       |                                                                                                             |
|-----------------------|-------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | when it takes too long to handle the call                                                                   |
| <i>OpNotSucceeded</i> | when a general failure occurs <ul style="list-style-type: none"> <li>BoardNr out of range [0, n]</li> </ul> |
| <i>OpNotAllowed</i>   | when not logged on                                                                                          |
| <i>OpNotSupported</i> | when called on mainboard or when call not supported yet on running software                                 |

**Version**

release 6.0

**8.63.4.5** void DCM::DeviceControl::SCR\_GetDefaultSessionWord ( in unsigned short *BoardNr*, out ByteStream *SessionWord*, out boolean *FollowDefault* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the default session word.

**Parameters**

|     |                      |                                               |
|-----|----------------------|-----------------------------------------------|
| in  | <i>BoardNr</i>       | board number on which to apply call           |
| out | <i>SessionWord</i>   | default session word on TS creation           |
| out | <i>FollowDefault</i> | indicate if factory default session word used |

**Note**

For security reasons, the SessionWord parameter will contain the factory default session word (and not the configured one)!

**Exceptions**

|                       |                                                                                                                                         |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | when it takes too long to handle the call                                                                                               |
| <i>OpNotSucceeded</i> | when a general failure occurs (e.g. BoardNr out of range [0, n])                                                                        |
| <i>OpNotAllowed</i>   | when not logged on                                                                                                                      |
| <i>OpNotSupported</i> | <ul style="list-style-type: none"> <li>• when called on mainboard</li> <li>• when call not supported yet on running software</li> </ul> |

**Version**

release 8.2

**8.63.4.6** void DCM::DeviceControl::SCR\_GetEncryptionAlgorithm ( in unsigned short *BoardNr*, out enEncryptionAlgorithm *eEncryptionAlgorithm* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the encryption algorithm.

**Parameters**

|     |                              |                                     |
|-----|------------------------------|-------------------------------------|
| in  | <i>BoardNr</i>               | board number on which to apply call |
| out | <i>eEncryption-Algorithm</i> | encryption algorithm (firmware)     |

**Exceptions**

|                       |                                                                                                               |
|-----------------------|---------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | a timeout occurred during IIOP processing                                                                     |
| <i>OpNotSucceeded</i> | when a general failure occurs <ul style="list-style-type: none"> <li>• BoardNr out of range [0, n]</li> </ul> |
| <i>OpNotAllowed</i>   | when not logged on                                                                                            |
| <i>OpNotSupported</i> | when called on mainboard or when call not supported yet on running software                                   |

**Version**

release 8.9

**8.63.4.7** void DCM::DeviceControl::SCR\_GetOperatingMode ( in IPS\_RefTS\_t *RefTS*, out enOperatingMode\_t *enOperatingMode* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the operating mode on TS.

**Parameters**

|     |                         |                           |
|-----|-------------------------|---------------------------|
| in  | <i>RefTS</i>            | TS on which to apply call |
| out | <i>enOperating-Mode</i> | new operating mode for TS |

**Exceptions**

|                       |                                                                                                 |
|-----------------------|-------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | when it takes too long to handle the call                                                       |
| <i>OpNotSucceeded</i> | when a general failure occurs <ul style="list-style-type: none"> <li>• RefTS invalid</li> </ul> |
| <i>OpNotAllowed</i>   | when not logged on                                                                              |
| <i>OpNotSupported</i> | when called on mainboard or when call not supported yet on running software                     |

**Version**

release 8.9

**8.63.4.8** void DCM::DeviceControl::SCR\_GetParityBit ( in IPS\_RefTS\_t *RefTS*, out octet *ParityBit* )  
 raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the parity bit on TS.

**Parameters**

|     |                  |                           |
|-----|------------------|---------------------------|
| in  | <i>RefTS</i>     | TS on which to apply call |
| out | <i>ParityBit</i> | parity bit on TS          |

**Exceptions**

|                       |                                                                                                 |
|-----------------------|-------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | when it takes too long to handle the call                                                       |
| <i>OpNotSucceeded</i> | when a general failure occurs <ul style="list-style-type: none"> <li>• RefTS invalid</li> </ul> |
| <i>OpNotAllowed</i>   | when not logged on                                                                              |
| <i>OpNotSupported</i> | when called on mainboard or when call not supported yet on running software                     |

**Version**

release 6.0

**8.63.4.9** void DCM::DeviceControl::SCR\_GetScramblingAction ( in unsigned short *BoardNr*, out enScramblingAction *eScramblingAction* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the scrambling/descrambling mode.

**Parameters**

|     |                           |                                     |
|-----|---------------------------|-------------------------------------|
| in  | <i>BoardNr</i>            | board number on which to apply call |
| out | <i>eScrambling-Action</i> | scrambling/descrambling mode        |

**Exceptions**

|                       |                                                                                                             |
|-----------------------|-------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | when it takes too long to handle the call                                                                   |
| <i>OpNotSucceeded</i> | when a general failure occurs <ul style="list-style-type: none"> <li>BoardNr out of range [0, n]</li> </ul> |
| <i>OpNotAllowed</i>   | when not logged on                                                                                          |
| <i>OpNotSupported</i> | when called on mainboard or when call not supported yet on running software                                 |

**Version**

release 8.0

**8.63.4.10** void DCM::DeviceControl::SCR\_GetScramblingMode ( in IPS\_RefTS\_t *RefTS*, out enScramblingMode *eScramblingMode* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the scrambling mode on TS.

**Parameters**

|     |                         |                           |
|-----|-------------------------|---------------------------|
| in  | <i>RefTS</i>            | TS on which to apply call |
| out | <i>eScrambling-Mode</i> | scrambling mode on TS     |

**Exceptions**

|                       |                                                                                               |
|-----------------------|-----------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | when it takes too long to handle the call                                                     |
| <i>OpNotSucceeded</i> | when a general failure occurs <ul style="list-style-type: none"> <li>RefTS invalid</li> </ul> |
| <i>OpNotAllowed</i>   | when not logged on                                                                            |
| <i>OpNotSupported</i> | when called on mainboard or when call not supported yet on running software                   |

**Version**

release 6.0

**8.63.4.11** void DCM::DeviceControl::SCR\_GetSessionWord ( in IPS\_RefTS\_t *RefTS*, out ByteStream *SessionWord*, out boolean *FollowDefault* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the session word on TS.

**Parameters**

|     |                      |                                               |
|-----|----------------------|-----------------------------------------------|
| in  | <i>RefTS</i>         | TS on which to apply call                     |
| out | <i>SessionWord</i>   | session word on TS                            |
| out | <i>FollowDefault</i> | indicate if factory default session word used |

**Note**

For security reasons, the SessionWord parameter will contain the factory default session word (and not the configured one)!

**Exceptions**

|                       |                                                                                                                                         |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | when it takes too long to handle the call                                                                                               |
| <i>OpNotSucceeded</i> | when a general failure occurs (e.g. RefTS invalid)                                                                                      |
| <i>OpNotAllowed</i>   | when not logged on                                                                                                                      |
| <i>OpNotSupported</i> | <ul style="list-style-type: none"> <li>• when called on mainboard</li> <li>• when call not supported yet on running software</li> </ul> |

**Version**

release 8.2

**8.63.4.12** void DCM::DeviceControl::SCR\_SetDefaultOperatingMode ( in unsigned short *BoardNr*, in enOperatingMode\_t *enOperatingMode* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the default operating mode.

**Parameters**

|    |                         |                                       |
|----|-------------------------|---------------------------------------|
| in | <i>BoardNr</i>          | board number on which to apply call   |
| in | <i>enOperating-Mode</i> | default operating mode on TS creation |

**Exceptions**

|                       |                                                                                                                                                       |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | when it takes too long to handle the call                                                                                                             |

| <i>OpNotSupported</i> | when called on mainboard or when call not supported yet on running software                                                             |

**Version**

release 8.9

**8.63.4.18** void DCM::DeviceControl::SCR\_SetParityBit ( in IPS\_RefTS\_t *RefTS*, in octet *ParityBit* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the parity bit on TS.

**Parameters**

|    |                  |                           |
|----|------------------|---------------------------|
| in | <i>RefTS</i>     | TS on which to apply call |
| in | <i>ParityBit</i> | new parity bit for TS     |

**Exceptions**

|                       |                                                                                                                                          |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | when it takes too long to handle the call                                                                                                |
| <i>OpNotSucceeded</i> | when a general failure occurs <ul style="list-style-type: none"> <li>• RefTS invalid</li> <li>• ParityBit out of range [0, 1]</li> </ul> |
| <i>OpNotAllowed</i>   | when not logged on                                                                                                                       |
| <i>OpNotSupported</i> | when called on mainboard or when call not supported yet on running software                                                              |

**Version**

release 6.0

**8.63.4.19** void DCM::DeviceControl::SCR\_SetScramblingAction ( in unsigned short *BoardNr*, in enScramblingAction *eScramblingAction* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the scrambling/descrambling mode.

**Parameters**

|    |                           |                                     |
|----|---------------------------|-------------------------------------|
| in | <i>BoardNr</i>            | board number on which to apply call |
| in | <i>eScrambling-Action</i> | scrambling/descrambling mode        |

**Note**

Changing the scrambling/descrambling mode will release all scrambling licenses on the board and will reset the services set for BISS scrambling/descrambling. The session word and parity bit on the TS will still remain unchanged.

**Exceptions**

|                       |                                                                                                                                                         |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | when it takes too long to handle the call                                                                                                               |
| <i>OpNotSucceeded</i> | when a general failure occurs <ul style="list-style-type: none"> <li>• BoardNr out of range [0, n]</li> <li>• eScramblingAction out of range</li> </ul> |
| <i>OpNotAllowed</i>   | when not logged on                                                                                                                                      |
| <i>OpNotSupported</i> | when called on mainboard or when call not supported yet on running software                                                                             |

**Version**

release 8.0

**8.63.4.20** void DCM::DeviceControl::SCR\_SetScramblingMode ( in IPS\_RefTS\_t *RefTS*, in enScramblingMode *eScramblingMode* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the scrambling mode on TS.

**Parameters**

|    |                         |                            |
|----|-------------------------|----------------------------|
| in | <i>RefTS</i>            | TS on which to apply call  |
| in | <i>eScrambling-Mode</i> | new scrambling mode for TS |

**Note**

Changing the scrambling mode will release all scrambling licenses on the TS and will reset the services set for BISS scrambling. The session word and parity bit on the TS will still remain unchanged.

**Exceptions**

|                       |                                                                                                                                         |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | when it takes too long to handle the call                                                                                               |
| <i>OpNotSucceeded</i> | when a general failure occurs <ul style="list-style-type: none"> <li>• RefTS invalid</li> <li>• eScramblingMode out of range</li> </ul> |
| <i>OpNotAllowed</i>   | when not logged on                                                                                                                      |
| <i>OpNotSupported</i> | when called on mainboard or when call not supported yet on running software                                                             |

**Version**

release 6.0

release 8.0 reset TS specific BISS settings

**8.63.4.21** void DCM::DeviceControl::SCR\_SetSessionWord ( in IPS\_RefTS\_t *RefTS*, in ByteStream *SessionWord* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the session word on TS.

**Parameters**

|    |                    |                           |
|----|--------------------|---------------------------|
| in | <i>RefTS</i>       | TS on which to apply call |
| in | <i>SessionWord</i> | new session word for TS   |

**Exceptions**

|                       |                                                                                                                                                         |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | when it takes too long to handle the call                                                                                                               |
| <i>OpNotSucceeded</i> | when a general failure occurs <ul style="list-style-type: none"> <li>• RefTS invalid</li> <li>• length of SessionWord different from 6 bytes</li> </ul> |
| <i>OpNotAllowed</i>   | when not logged on                                                                                                                                      |
| <i>OpNotSupported</i> | when called on mainboard or when call not supported yet on running software                                                                             |

**Version**

release 6.0

**8.63.4.22** void DCM::DeviceControl::SCR\_StartBissScrambling ( in IPS\_RefTS\_t *RefTS*, in SidList\_t *lstSIDs*, in PidList\_t *lstPIDs* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Start BISS scrambling/descrambling on a TS.

**Parameters**

|    |                |                                                       |
|----|----------------|-------------------------------------------------------|
| in | <i>RefTS</i>   | TS on which to apply call                             |
| in | <i>lstSIDs</i> | list of services (SID) to start BISS scrambling for   |
| in | <i>lstPIDs</i> | list of components (PID) to start BISS scrambling for |

Depending on the board level scrambling/descrambling mode, this will start BISS scrambling or BISS descrambling for the specified services.

#### Remarks

- The setting (SID's to scramble) will be applied no matter what mode (DVB or BISS) the TS is configured.
  - The setting (SID to scramble) will be changed automatically when the SID of the corresponding service changes.
  - the setting (SID to scramble) will be removed automatically when the corresponding service is removed.

#### Note

The parameter *lstPIDs* is not used so far, but is just present to allow future extensions (supporting BISS-like component scrambling).

#### Exceptions

|                       |                                                                                                                                                            |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | when it takes too long to handle the call                                                                                                                  |
| <i>OpNotSucceeded</i> | when a general failure occurs <ul style="list-style-type: none"> <li>• RefTS invalid</li> <li>• invalid SID in list (service not present on TS)</li> </ul> |
| <i>OpNotAllowed</i>   | when not logged on                                                                                                                                         |
| <i>OpNotSupported</i> | when called on mainboard or when call not supported yet on running software                                                                                |

#### Version

release 6.0  
release 8.0 - action will start BISS descrambling as well

**8.63.4.23** void DCM::DeviceControl::SCR\_StopBissScrambling ( in IPS\_RefTS\_t *RefTS*, in SidList\_t *lstSIDs*, in PidList\_t *lstPIDs* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Stop BISS scrambling/descrambling on a TS.

#### Parameters

|    |                |                                                      |
|----|----------------|------------------------------------------------------|
| in | <i>RefTS</i>   | TS on which to apply call                            |
| in | <i>lstSIDs</i> | list of services (SID) to stop BISS scrambling for   |
| in | <i>lstPIDs</i> | list of components (PID) to stop BISS scrambling for |

Depending on the board level scrambling/descrambling mode, this will stop BISS scrambling or BISS descrambling for the specified services.

#### Remarks

An empty list (*lstSIDs*) will stop scrambling for all services.

**Note**

The parameter `lstPIDs` is not used so far, but is just present to allow future extensions (supporting BISS-like component scrambling).

**Exceptions**

|                       |                                                                                                                                                         |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | when it takes too long to handle the call                                                                                                               |
| <i>OpNotSucceeded</i> | when a general failure occurs <ul style="list-style-type: none"><li>• RefTS invalid</li><li>• invalid SID in list (service not present on TS)</li></ul> |
| <i>OpNotAllowed</i>   | when not logged on                                                                                                                                      |
| <i>OpNotSupported</i> | when called on mainboard or when call not supported yet on running software                                                                             |

**Version**

release 6.0

release 8.0 - action will stop BISS descrambling as well

## 8.64 Tier Based Scrambling

This module contains types, enums and methods related to tier based scrambling.

### Classes

- struct `DCM::DeviceControl::AC_t`  
*Access Criteria.*
- struct `DCM::DeviceControl::TierAC_t`  
*Access criteria for tier based scrambling.*
- struct `DCM::DeviceControl::TierData_t`  
*Tier data.*
- struct `DCM::DeviceControl::TS_Tier_t`  
*Tier based settings.*

### Typedefs

- typedef `sequence< TS_Tier_t > DCM::DeviceControl::TS_Tier_List_t`  
*A sequence of `TS_Tier_t` entries.*

### Enumerations

- enum `DCM::DeviceControl::enScramblingMode_V2` { `DCM::DeviceControl::eDvbScrambling_V2`, `DCM::DeviceControl::eBissScrambling_V2`, `DCM::DeviceControl::eTierBasedScrambling_V2`, `DCM::DeviceControl::eScramblingMode_V2_Reserved4`, `DCM::DeviceControl::eScramblingMode_V2_Reserved5`, `DCM::DeviceControl::eScramblingMode_V2_Reserved6` }  
*Scrambling mode.*

### Functions

- void `DCM::DeviceControl::SCR_SetDefaultScramblingMode_V2` (in unsigned short BoardNr, in `enScramblingMode_V2 eScramblingMode`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Set the default scrambling mode.*
- void `DCM::DeviceControl::SCR_GetDefaultScramblingMode_V2` (in unsigned short BoardNr, out `enScramblingMode_V2 eScramblingMode`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get the default scrambling mode.*
- void `DCM::DeviceControl::SCR_SetDefaultScramblingEnabled` (in unsigned short BoardNr, in boolean bEnable) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Default enable scrambling behavior for services.*
- void `DCM::DeviceControl::SCR_GetDefaultScramblingEnabled` (in unsigned short BoardNr, out boolean bEnabled) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get default enable scrambling behavior for services.*
- void `DCM::DeviceControl::SCR_SetScramblingMode_V2` (in `IPS_RefTS_t RefTS`, in `enScramblingMode_V2 eScramblingMode`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Set the scrambling mode on TS.*

- void [DCM::DeviceControl::SCR\\_GetScramblingMode\\_V2](#) (in IPS\_RefTS\_t RefTS, out enScramblingMode\_V2 eScramblingMode) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the scrambling mode on TS.*

- void [DCM::DeviceControl::SCR\\_GetTierList](#) (in unsigned short BoardNr, out IdList TierIds) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get list of configured tiers.*

- void [DCM::DeviceControl::SCR\\_CreateTier](#) (in unsigned short BoardNr, out unsigned long TierId) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Create tier.*

- void [DCM::DeviceControl::SCR\\_DeleteTier](#) (in unsigned short BoardNr, in unsigned long TierId) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Delete tier.*

- void [DCM::DeviceControl::SCR\\_SetTierData](#) (in unsigned short BoardNr, in TierData\_t TierData) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Configure access criteria for tier.*

- void [DCM::DeviceControl::SCR\\_GetTierData](#) (in unsigned short BoardNr, in unsigned long TierId, out TierData\_t TierData) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get configured access criteria for tier.*

- void [DCM::DeviceControl::SCR\\_SetDefaultTier](#) (in unsigned short BoardNr, in unsigned long TierId) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Set the default tier.*

- void [DCM::DeviceControl::SCR\\_GetDefaultTier](#) (in unsigned short BoardNr, out unsigned long TierId) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the default tier.*

- void [DCM::DeviceControl::SCR\\_SetTier](#) (in IPS\_RefTS\_t RefTS, in unsigned long TierId) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Set tier for TS.*

- void [DCM::DeviceControl::SCR\\_GetTier](#) (in IPS\_RefTS\_t RefTS, out unsigned long TierId) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get tier for TS.*

- void [DCM::DeviceControl::SCR\\_SetScramblingEnabled](#) (in IPS\_Service\_t RefSvc, in boolean b-Enable) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Enable scrambling for service.*

- void [DCM::DeviceControl::SCR\\_GetScramblingEnabled](#) (in IPS\_Service\_t RefSvc, out boolean b-Enabled) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get scrambling enabled status for service.*

## Variables

- const unsigned long [DCM::DeviceControl::INVALID\\_TIER\\_ID](#) = 0xffffffff

*Invalid tier\_id.*

### 8.64.1 Detailed Description

This module contains types, enums and methods related to tier based scrambling.

## 8.64.2 Typedef Documentation

## 8.64.2.1 typedef sequence&lt;TS\_Tier\_t&gt; DCM::DeviceControl::TS\_Tier\_List\_t

A sequence of [TS\\_Tier\\_t](#) entries.

Definition at line 27661 of file DCM.idl.

## 8.64.3 Enumeration Type Documentation

## 8.64.3.1 enum DCM::DeviceControl::enScramblingMode\_V2

Scrambling mode.

Enumerator:

*eDvbScrambling\_V2* DVB simulcrypt scrambling.

*eBissScrambling\_V2* BISS scrambling (BISS mode 1 and fixed CW)

*eTierBasedScrambling\_V2* Tier based scrambling (share ECM across TS's)

*eScramblingMode\_V2\_Reserved4* Reserved for future use.

*eScramblingMode\_V2\_Reserved5* Reserved for future use.

*eScramblingMode\_V2\_Reserved6* Reserved for future use.

Definition at line 27621 of file DCM.idl.

## 8.64.4 Function Documentation

8.64.4.1 void DCM::DeviceControl::SCR\_CreateTier ( in unsigned short *BoardNr*, out unsigned long *TierId* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Create tier.

## Parameters

|     |                |                                                   |
|-----|----------------|---------------------------------------------------|
| in  | <i>BoardNr</i> | board on which to apply call                      |
| out | <i>TierId</i>  | tier_id (unique identifier) for newly create tier |

## Exceptions

|                       |                                                                                                                                               |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | a timeout occurred during IIOP processing                                                                                                     |
| <i>OpNotSucceeded</i> | when a general failure occurs <ul style="list-style-type: none"> <li>BoardNr out of range</li> <li>Maximum number of tiers reached</li> </ul> |
| <i>OpNotAllowed</i>   | when not logged on                                                                                                                            |
| <i>OpNotSupported</i> | when called on mainboard or when call not yet supported on running software version                                                           |

**Note**

not implemented yet, so OpNotSupported will always be raised.

**8.64.4.2** void DCM::DeviceControl::SCR\_DeleteTier ( in unsigned short *BoardNr*, in unsigned long *TierId* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Delete tier.

**Parameters**

|    |                |                                               |
|----|----------------|-----------------------------------------------|
| in | <i>BoardNr</i> | board on which to apply call                  |
| in | <i>TierId</i>  | tier_id (unique identifier) of tier to remove |

**Exceptions**

|                       |                                                                                                                                  |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | a timeout occurred during IIOP processing                                                                                        |
| <i>OpNotSucceeded</i> | when a general failure occurs <ul style="list-style-type: none"> <li>• BoardNr out of range</li> <li>• Invalid TierId</li> </ul> |
| <i>OpNotAllowed</i>   | when not logged on                                                                                                               |
| <i>OpNotSupported</i> | when called on mainboard or when call not yet supported on running software version                                              |

**Note**

not implemented yet, so OpNotSupported will always be raised.

**8.64.4.3** void DCM::DeviceControl::SCR\_GetDefaultScramblingEnabled ( in unsigned short *BoardNr*, out boolean *bEnabled* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get default enable scrambling behavior for services.

**Parameters**

|     |                 |                                     |
|-----|-----------------|-------------------------------------|
| in  | <i>BoardNr</i>  | board number on which to apply call |
| out | <i>bEnabled</i> | enabled or disabled                 |

**Exceptions**

|                       |                                                                                                        |
|-----------------------|--------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | a timeout occurred during IIOP processing                                                              |
| <i>OpNotSucceeded</i> | when a general failure occurs <ul style="list-style-type: none"> <li>• BoardNr out of range</li> </ul> |
| <i>OpNotAllowed</i>   | when not logged on                                                                                     |
| <i>OpNotSupported</i> | when called on mainboard or when call not yet supported on running software version                    |

**Note**

not implemented yet, so OpNotSupported will always be raised.

**8.64.4.4** void DCM::DeviceControl::SCR\_GetDefaultScramblingMode\_V2 ( in unsigned short *BoardNr*, out enScramblingMode\_V2 *eScramblingMode* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the default scrambling mode.

**Parameters**

|     |                         |                                        |
|-----|-------------------------|----------------------------------------|
| in  | <i>BoardNr</i>          | board number on which to apply call    |
| out | <i>eScrambling-Mode</i> | default scrambling mode on TS creation |

**Exceptions**

|                       |                                                                                                               |
|-----------------------|---------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | when it takes too long to handle the call                                                                     |
| <i>OpNotSucceeded</i> | when a general failure occurs <ul style="list-style-type: none"> <li>• BoardNr out of range [0, n]</li> </ul> |
| <i>OpNotAllowed</i>   | when not logged on                                                                                            |
| <i>OpNotSupported</i> | when called on mainboard or when call not supported yet on running software                                   |

**Note**

not implemented yet, so OpNotSupported will always be raised.

**8.64.4.5** void DCM::DeviceControl::SCR\_GetDefaultTier ( in unsigned short *BoardNr*, out unsigned long *TierId* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the default tier.

**Parameters**

|     |                |                                                             |
|-----|----------------|-------------------------------------------------------------|
| in  | <i>BoardNr</i> | board on which to apply call                                |
| out | <i>TierId</i>  | default tier on TS creation (invalid if no tier configured) |

**Exceptions**

|                       |                                                                                                        |
|-----------------------|--------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | a timeout occurred during IIOP processing                                                              |
| <i>OpNotSucceeded</i> | when a general failure occurs <ul style="list-style-type: none"> <li>• BoardNr out of range</li> </ul> |
| <i>OpNotAllowed</i>   | when not logged on                                                                                     |
| <i>OpNotSupported</i> | when called on mainboard or when call not yet supported on running software version                    |

**Note**

not implemented yet, so OpNotSupported will always be raised.

**8.64.4.6** void DCM::DeviceControl::SCR\_GetScramblingEnabled ( in IPS\_Service\_t *RefSvc*, out boolean *bEnabled* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get scrambling enabled status for service.

#### Parameters

|     |                 |                                          |
|-----|-----------------|------------------------------------------|
| in  | <i>RefSvc</i>   | service to enable/disable scrambling for |
| out | <i>bEnabled</i> | enabled or disabled                      |

#### Exceptions

|                       |                                                                                                                              |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | a timeout occurred during IOP processing                                                                                     |
| <i>OpNotSucceeded</i> | when a general failure occurs <ul style="list-style-type: none"> <li>BoardNr out of range</li> <li>Invalid RefSvc</li> </ul> |
| <i>OpNotAllowed</i>   | when not logged on                                                                                                           |
| <i>OpNotSupported</i> | when called on mainboard or when call not yet supported on running software version                                          |

#### Note

not implemented yet, so OpNotSupported will always be raised.

**8.64.4.7** void DCM::DeviceControl::SCR\_GetScramblingMode\_V2 ( in IPS\_RefTS\_t *RefTS*, out enScramblingMode\_V2 *eScramblingMode* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the scrambling mode on TS.

#### Parameters

|     |                         |                           |
|-----|-------------------------|---------------------------|
| in  | <i>RefTS</i>            | TS on which to apply call |
| out | <i>eScrambling-Mode</i> | scrambling mode on TS     |

#### Exceptions

|                       |                                                                                               |
|-----------------------|-----------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | when it takes too long to handle the call                                                     |
| <i>OpNotSucceeded</i> | when a general failure occurs <ul style="list-style-type: none"> <li>RefTS invalid</li> </ul> |
| <i>OpNotAllowed</i>   | when not logged on                                                                            |
| <i>OpNotSupported</i> | when called on mainboard or when call not supported yet on running software                   |

**Note**

not implemented yet, so OpNotSupported will always be raised.

**8.64.4.8** void DCM::DeviceControl::SCR\_GetTier ( in IPS\_RefTS\_t *RefTS*, out unsigned long *TierId* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get tier for TS.

**Parameters**

|     |               |                           |
|-----|---------------|---------------------------|
| in  | <i>RefTS</i>  | TS on which to apply call |
| out | <i>TierId</i> | tier that TS belongs to   |

**Exceptions**

|                       |                                                                                                                                 |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | a timeout occurred during IIOP processing                                                                                       |
| <i>OpNotSucceeded</i> | when a general failure occurs <ul style="list-style-type: none"> <li>• BoardNr out of range</li> <li>• Invalid RefTS</li> </ul> |
| <i>OpNotAllowed</i>   | when not logged on                                                                                                              |
| <i>OpNotSupported</i> | when called on mainboard or when call not yet supported on running software version                                             |

**Note**

not implemented yet, so OpNotSupported will always be raised.

**8.64.4.9** void DCM::DeviceControl::SCR\_GetTierData ( in unsigned short *BoardNr*, in unsigned long *TierId*, out TierData\_t *TierData* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get configured access criteria for tier.

**Parameters**

|     |                 |                               |
|-----|-----------------|-------------------------------|
| in  | <i>BoardNr</i>  | board on which to apply call  |
| in  | <i>TierId</i>   | tier to get configuration for |
| out | <i>TierData</i> | tier configuration            |

**Exceptions**

|                       |                                                                                                                                  |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | a timeout occurred during IIOP processing                                                                                        |
| <i>OpNotSucceeded</i> | when a general failure occurs <ul style="list-style-type: none"> <li>• BoardNr out of range</li> <li>• Invalid TierId</li> </ul> |
| <i>OpNotAllowed</i>   | when not logged on                                                                                                               |
| <i>OpNotSupported</i> | when called on mainboard or when call not yet supported on running software version                                              |

**Note**

not implemented yet, so OpNotSupported will always be raised.

**8.64.4.10** void DCM::DeviceControl::SCR\_GetTierList ( in unsigned short *BoardNr*, out IdList *TierIds* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get list of configured tiers.

**Parameters**

|     |                |                              |
|-----|----------------|------------------------------|
| in  | <i>BoardNr</i> | board on which to apply call |
| out | <i>TierIds</i> | list of tiers (tier_id)      |

**Exceptions**

|                       |                                                                                                      |
|-----------------------|------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | a timeout occurred during IIOP processing                                                            |
| <i>OpNotSucceeded</i> | when a general failure occurs <ul style="list-style-type: none"> <li>BoardNr out of range</li> </ul> |
| <i>OpNotAllowed</i>   | when not logged on                                                                                   |
| <i>OpNotSupported</i> | when called on mainboard or when call not yet supported on running software version                  |

**Note**

not implemented yet, so OpNotSupported will always be raised.

**8.64.4.11** void DCM::DeviceControl::SCR\_SetDefaultScramblingEnabled ( in unsigned short *BoardNr*, in boolean *bEnable* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Default enable scrambling behavior for services.

**Parameters**

|    |                |                                     |
|----|----------------|-------------------------------------|
| in | <i>BoardNr</i> | board number on which to apply call |
| in | <i>bEnable</i> | enable or disable                   |

**Exceptions**

|                       |                                                                                                      |
|-----------------------|------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | a timeout occurred during IIOP processing                                                            |
| <i>OpNotSucceeded</i> | when a general failure occurs <ul style="list-style-type: none"> <li>BoardNr out of range</li> </ul> |
| <i>OpNotAllowed</i>   | when not logged on                                                                                   |
| <i>OpNotSupported</i> | when called on mainboard or when call not yet supported on running software version                  |

**Note**

not implemented yet, so OpNotSupported will always be raised.

**8.64.4.12** void DCM::DeviceControl::SCR\_SetDefaultScramblingMode\_V2 ( in unsigned short *BoardNr*, in enScramblingMode\_V2 *eScramblingMode* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the default scrambling mode.

#### Parameters

|    |                        |                                        |
|----|------------------------|----------------------------------------|
| in | <i>BoardNr</i>         | board number on which to apply call    |
| in | <i>eScramblingMode</i> | default scrambling mode on TS creation |

#### Exceptions

|                       |                                                                                                                                                       |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | when it takes too long to handle the call                                                                                                             |
| <i>OpNotSucceeded</i> | when a general failure occurs <ul style="list-style-type: none"> <li>• BoardNr out of range [0, n]</li> <li>• eScramblingMode out of range</li> </ul> |
| <i>OpNotAllowed</i>   | when not logged on                                                                                                                                    |
| <i>OpNotSupported</i> | when called on mainboard or when call not supported yet on running software                                                                           |

#### Note

not implemented yet, so OpNotSupported will always be raised.

**8.64.4.13** void DCM::DeviceControl::SCR\_SetDefaultTier ( in unsigned short *BoardNr*, in unsigned long *TierId* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the default tier.

#### Parameters

|    |                |                              |
|----|----------------|------------------------------|
| in | <i>BoardNr</i> | board on which to apply call |
| in | <i>TierId</i>  | default tier on TS creation  |

#### Exceptions

|                       |                                                                                                                                  |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | a timeout occurred during IIOP processing                                                                                        |
| <i>OpNotSucceeded</i> | when a general failure occurs <ul style="list-style-type: none"> <li>• BoardNr out of range</li> <li>• Invalid TierId</li> </ul> |
| <i>OpNotAllowed</i>   | when not logged on                                                                                                               |
| <i>OpNotSupported</i> | when called on mainboard or when call not yet supported on running software version                                              |

#### Note

not implemented yet, so OpNotSupported will always be raised.

**8.64.4.14** void DCM::DeviceControl::SCR\_SetScramblingEnabled ( in IPS\_Service\_t *RefSvc*, in boolean *bEnable* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Enable scrambling for service.

#### Parameters

|    |                |                                          |
|----|----------------|------------------------------------------|
| in | <i>RefSvc</i>  | service to enable/disable scrambling for |
| in | <i>bEnable</i> | enable or disable                        |

#### Exceptions

|                       |                                                                                                                                  |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | a timeout occurred during IOP processing                                                                                         |
| <i>OpNotSucceeded</i> | when a general failure occurs <ul style="list-style-type: none"> <li>• BoardNr out of range</li> <li>• Invalid RefSvc</li> </ul> |
| <i>OpNotAllowed</i>   | when not logged on                                                                                                               |
| <i>OpNotSupported</i> | when called on mainboard or when call not yet supported on running software version                                              |

#### Note

not implemented yet, so OpNotSupported will always be raised.

**8.64.4.15** void DCM::DeviceControl::SCR\_SetScramblingMode\_V2 ( in IPS\_RefTS\_t *RefTS*, in enScramblingMode\_V2 *eScramblingMode* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set the scrambling mode on TS.

#### Parameters

|    |                         |                            |
|----|-------------------------|----------------------------|
| in | <i>RefTS</i>            | TS on which to apply call  |
| in | <i>eScrambling-Mode</i> | new scrambling mode for TS |

#### Note

Changing the scrambling mode will release all scrambling licenses on the TS and will reset the services set for BISS scrambling. The session word and parity bit on the TS will still remain unchanged.

#### Exceptions

|                       |                                                                                                                                         |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | when it takes too long to handle the call                                                                                               |
| <i>OpNotSucceeded</i> | when a general failure occurs <ul style="list-style-type: none"> <li>• RefTS invalid</li> <li>• eScramblingMode out of range</li> </ul> |
| <i>OpNotAllowed</i>   | when not logged on                                                                                                                      |
| <i>OpNotSupported</i> | when called on mainboard or when call not supported yet on running software                                                             |

**Note**

not implemented yet, so OpNotSupported will always be raised.

**8.64.4.16** void DCM::DeviceControl::SCR\_SetTier ( in IPS\_RefTS\_t *RefTS*, in unsigned long *TierId* )  
raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set tier for TS.

**Parameters**

|    |               |                           |
|----|---------------|---------------------------|
| in | <i>RefTS</i>  | TS on which to apply call |
| in | <i>TierId</i> | tier to be applied        |

**Exceptions**

|                       |                                                                                                                                                           |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | a timeout occurred during IIOP processing                                                                                                                 |
| <i>OpNotSucceeded</i> | when a general failure occurs <ul style="list-style-type: none"> <li>• BoardNr out of range</li> <li>• Invalid RefTS</li> <li>• Invalid TierId</li> </ul> |
| <i>OpNotAllowed</i>   | when not logged on                                                                                                                                        |
| <i>OpNotSupported</i> | when called on mainboard or when call not yet supported on running software version                                                                       |

**Note**

not implemented yet, so OpNotSupported will always be raised.

**8.64.4.17** void DCM::DeviceControl::SCR\_SetTierData ( in unsigned short *BoardNr*, in TierData\_t *TierData* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Configure access criteria for tier.

**Parameters**

|    |                 |                              |
|----|-----------------|------------------------------|
| in | <i>BoardNr</i>  | board on which to apply call |
| in | <i>TierData</i> | tier configuration           |

**Exceptions**

|                       |                                                                                                                                  |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | a timeout occurred during IIOP processing                                                                                        |
| <i>OpNotSucceeded</i> | when a general failure occurs <ul style="list-style-type: none"> <li>• BoardNr out of range</li> <li>• Invalid TierId</li> </ul> |
| <i>OpNotAllowed</i>   | when not logged on                                                                                                               |
| <i>OpNotSupported</i> | when called on mainboard or when call not yet supported on running software version                                              |

**Note**

not implemented yet, so OpNotSupported will always be raised.

**8.64.5 Variable Documentation****8.64.5.1 `const unsigned long DCM::DeviceControl::INVALID_TIER_ID = 0xffffffff`**

Invalid tier\_id.

## 8.65 Descrambling

This module contains types, enums and methods related to descrambling on a DRD DVB S2 board.

### Classes

- struct [DCM::DeviceControl::DescrResource\\_t](#)  
*Structure containing identification information about the descrambling resource.*
- struct [DCM::DeviceControl::DescrServiceData\\_t](#)  
*A structure with attributes of the service routed to the descrambler.*
- struct [DCM::DeviceControl::DescrTS\\_Data\\_t](#)  
*Structure with data of a TS added to a descrambler.*
- struct [DCM::DeviceControl::DescrTS\\_Data\\_V2\\_t](#)  
*Structure with data of a TS added to a descrambler.*
- struct [DCM::DeviceControl::DescrTrackingRule\\_t](#)  
*Defines a tracking rule for descrambling, including the BISS session word.*
- struct [DCM::DeviceControl::DescrSvcConfig\\_t](#)  
*Defines how the service is descrambled.*
- struct [DCM::DeviceControl::DescrCAM\\_Cfg\\_t](#)  
*Defines the configuration of the CAM itself.*
- struct [DCM::DeviceControl::DescrCAM\\_Cfg\\_V2\\_t](#)  
*Defines the configuration of the CAM itself.*
- struct [DCM::DeviceControl::DescrCAM\\_BackupCfg\\_t](#)  
*Structure used to configure CAM backup.*
- struct [DCM::DeviceControl::DescrCAM\\_Status\\_t](#)  
*Structure containing information about a CAM.*
- struct [DCM::DeviceControl::DescrBISS\\_Cfg\\_t](#)  
*Configuration of BISS descrambling.*

### Typedefs

- typedef unsigned short [DCM::DeviceControl::DescrId\\_t](#)  
*Identifies a descrambling resource on a board.*
- typedef sequence< [DescrId\\_t](#) > [DCM::DeviceControl::DescrId\\_List\\_t](#)  
*A list of descrambling resource id's.*
- typedef sequence< [DescrResource\\_t](#) > [DCM::DeviceControl::DescrResource\\_List\\_t](#)  
*A list of [DescrResource\\_t](#).*
- typedef sequence< [DescrServiceData\\_t](#) > [DCM::DeviceControl::DescrServiceData\\_List\\_t](#)  
*A list of [DescrServiceData\\_t](#).*
- typedef sequence< [DescrTS\\_Data\\_t](#) > [DCM::DeviceControl::DescrTS\\_Data\\_List\\_t](#)  
*A sequence of [DescrTS\\_Data\\_t](#) entries.*
- typedef sequence< [DescrTS\\_Data\\_V2\\_t](#) > [DCM::DeviceControl::DescrTS\\_Data\\_List\\_V2\\_t](#)  
*A sequence of [DescrTS\\_Data\\_V2\\_t](#) entries.*
- typedef sequence< [DescrTrackingRule\\_t](#) > [DCM::DeviceControl::DescrTrackingRuleList\\_t](#)  
*A sequence of [DescrTrackingRule\\_t](#).*
- typedef sequence< [DescrSvcConfig\\_t](#) > [DCM::DeviceControl::DescrSvcConfig\\_List\\_t](#)
- typedef sequence< [DescrCAM\\_Cfg\\_t](#) > [DCM::DeviceControl::DescrCAM\\_Cfg\\_List\\_t](#)

- typedef sequence < DescrCAM\_Cfg\_V2\_t > [DCM::DeviceControl::DescrCAM\\_Cfg\\_List\\_V2\\_t](#)
- typedef sequence < DescrCAM\_BackupCfg\_t > [DCM::DeviceControl::DescrCAM\\_BackupCfg\\_List\\_t](#)  
*A sequence of [DescrCAM\\_BackupCfg\\_t](#).*
- typedef sequence < DescrCAM\_Status\_t > [DCM::DeviceControl::DescrCAM\\_Status\\_List\\_t](#)  
*A sequence of [DescrCAM\\_Status\\_t](#).*
- typedef sequence < DescrBISS\_Cfg\_t > [DCM::DeviceControl::DescrBISS\\_Cfg\\_List\\_t](#)  
*A sequence of [DescrBISS\\_Cfg\\_t](#).*

### Enumerations

- enum [DCM::DeviceControl::eDescrType\\_t](#) { [DCM::DeviceControl::eDescrType\\_CAM](#), [DCM::DeviceControl::eDescrType\\_BISS](#), [DCM::DeviceControl::eDescrType\\_Reserved1](#), [DCM::DeviceControl::eDescrType\\_Reserved2](#), [DCM::DeviceControl::eDescrType\\_Reserved3](#) }  
*The different descrambling resource types.*
- enum [DCM::DeviceControl::eDescrEnabledMode\\_t](#) { [DCM::DeviceControl::eDescrEnabledMode\\_Disabled](#), [DCM::DeviceControl::eDescrEnabledMode\\_Service](#), [DCM::DeviceControl::eDescrEnabledMode\\_Component](#), [DCM::DeviceControl::eDescrEnabledMode\\_Reserved1](#), [DCM::DeviceControl::eDescrEnabledMode\\_Reserved2](#), [DCM::DeviceControl::eDescrEnabledMode\\_Reserved3](#) }  
*Represents how a service needs to be descrambled.*
- enum [DCM::DeviceControl::eCaPmtListManagement\\_t](#) { [DCM::DeviceControl::eCaPmtListManagement\\_AddDelete](#), [DCM::DeviceControl::eCaPmtListManagement\\_UpdateAll](#), [DCM::DeviceControl::eCaPmtListManagement\\_Reserved1](#), [DCM::DeviceControl::eCaPmtListManagement\\_Reserved2](#), [DCM::DeviceControl::eCaPmtListManagement\\_Reserved3](#) }  
*Represents how CA PMT lists need to be updated towards the CAM.*

### Functions

- void [DCM::DeviceControl::DescrResourceGetL](#) (in unsigned short BoardNr, out DescrResource\_List\_t DescrResourceList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Retrieve the list of available descrambling resources for a given board.*
- void [DCM::DeviceControl::DescrResourceSetL](#) (in unsigned short BoardNr, in DescrResource\_List\_t ConfigList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Configure the name of one or more descrambling resources.*
- void [DCM::DeviceControl::DescrServiceAddL](#) (in IPS\_Ref\_t DescramblerRef, in IPS\_RefSvc\_List\_t InputRefSvcList, out IPS\_RefSvc\_List\_t CreatedServicesL) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Add a list of services to a descrambling resource.*
- void [DCM::DeviceControl::DescrServiceDeleteL](#) (in unsigned short BoardNr, in IPS\_RefSvc\_List\_t RefSvcList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Removes a list of services from a descrambling resource.*
- void [DCM::DeviceControl::DescrServiceGetL](#) (in IPS\_Ref\_t DescramblerRef, in IPS\_RefSvc\_List\_t RefSvcList, out DescrServiceData\_List\_t ServiceList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Get the list of services on a descrambling resource.*
- void [DCM::DeviceControl::DescrServiceSetL](#) (in unsigned short BoardNr, in DescrServiceData\_List\_t ServiceDataList) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)  
*Set service details of services on a descrambler.*

- void [DCM::DeviceControl::DescrTS\\_Add](#) (in `IPS_Ref_t DescramblerRef`, in `IPS_RefTS_t RefTsIn`, out `IPS_RefTS_t CreatedTs`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Add a TS to a descrambler.*

- void [DCM::DeviceControl::DescrTS\\_DeleteL](#) (in unsigned short `BoardNr`, in `IPS_RefTS_List_t RefTsList`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Remove one or more TS's from a descrambler.*

- void [DCM::DeviceControl::DescrTS\\_GetL](#) (in unsigned short `BoardNr`, in `IPS_RefTS_List_t RefTsList`, out `DescrTS_Data_List_t TsDataList`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Get the list of transport streams passed to a descrambler board.*

- void [DCM::DeviceControl::DescrTS\\_GetL\\_V2](#) (in unsigned short `BoardNr`, in `IPS_RefTS_List_t RefTsList`, out `DescrTS_Data_List_V2_t TsDataList`) raises (Timeout, OperationFailed, OpNotAllowed, OpNotSupported)

*Get the list of transport streams passed to a descrambler board.*

- void [DCM::DeviceControl::DescrTS\\_SetL](#) (in unsigned short `BoardNr`, in `DescrTS_Data_List_t TsDataList`) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

*Set TS details of one or more TS's on a descrambler.*

- void [DCM::DeviceControl::DescrTS\\_SetL\\_V2](#) (in unsigned short `BoardNr`, in `DescrTS_Data_List_V2_t TsDataList`) raises (Timeout, OperationFailed, OpNotAllowed, OpNotSupported)

*Set TS details of one or more TS's on a descrambler.*

- void [DCM::DeviceControl::DescrEMM\\_AddL](#) (in `IPS_Ref_t DescramblerRef`, in `IPS_RefPidList_t EmmList`) raises (Timeout, OpNotSucceeded, OpNotSupported, OpNotAllowed)

*Add one or more EMM to a descrambler.*

- void [DCM::DeviceControl::DescrEMM\\_DeleteL](#) (in unsigned short `BoardNr`, in `IPS_RefPidList_t EmmList`) raises (Timeout, OpNotSucceeded, OpNotSupported, OpNotAllowed)

*Deletes one or more EMMs routed to a CAM.*

- void [DCM::DeviceControl::DescrEMM\\_GetL](#) (in `IPS_Ref_t DescramblerRef`, out `IPS_RefPidList_t EmmList`) raises (Timeout, OpNotSucceeded, OpNotSupported, OpNotAllowed)

*Retrieve the list of EMMs routed to a CAM.*

- void [DCM::DeviceControl::DescrSvcConfigSetL](#) (in unsigned short `BoardNr`, in `DescrSvcConfig_List_t ConfigList`) raises (Timeout, OpNotAllowed, OpNotSupported, OpNotSucceeded)

*Start descrambling on services / components on the specified virtual TS.*

- void [DCM::DeviceControl::DescrSvcConfigGetL](#) (in `IPS_Ref_t DescramblerRef`, in `IPS_RefSvc_List_t SvcFilter`, out `DescrSvcConfig_List_t ConfigList`) raises (Timeout, OpNotAllowed, OpNotSupported, OpNotSucceeded)

*Returns the services / PIDs for which descrambling is configured.*

- void [DCM::DeviceControl::DescrCAM\\_CfgSetL](#) (in unsigned short `BoardNr`, in `DescrCAM_Cfg_List_t ConfigList`) raises (Timeout, OpNotAllowed, OpNotSupported, OpNotSucceeded, LicenseError)

*Configures one or more CAMs.*

- void [DCM::DeviceControl::DescrCAM\\_CfgSetL\\_V2](#) (in unsigned short `BoardNr`, in `DescrCAM_Cfg_List_V2_t ConfigList`) raises (Timeout, OpNotAllowed, OpNotSupported, OpNotSucceeded, LicenseError)

*Configures one or more CAMs.*

- void [DCM::DeviceControl::DescrCAM\\_CfgGetL](#) (in `IPS_Ref_t CamRef`, out `DescrCAM_Cfg_List_t ConfigList`) raises (Timeout, OpNotAllowed, OpNotSupported, OpNotSucceeded)

*Retrieves the configuration of one or more CAMs.*

- void [DCM::DeviceControl::DescrCAM\\_CfgGetL\\_V2](#) (in `IPS_Ref_t CamRef`, out `DescrCAM_Cfg_List_V2_t ConfigList`) raises (Timeout, OpNotAllowed, OpNotSupported, OpNotSucceeded)

*Retrieves the configuration of one or more CAMs.*

- void [DCM::DeviceControl::DescrCAM\\_BackupCfg\\_SetL](#) (in unsigned short BoardNr, in DescrCAM\_BackupCfg\_List\_t BackupConfigL) raises (TimeOut, OpNotAllowed, OpNotSupported, OpNotSucceeded)

*Set backup configuration for one or more CAM pairs.*

- void [DCM::DeviceControl::DescrCAM\\_BackupCfg\\_GetL](#) (in unsigned short BoardNr, out DescrCAM\_BackupCfg\_List\_t BackupConfigL) raises (TimeOut, OpNotAllowed, OpNotSupported, OpNotSucceeded)

*Retrieve the CAM backup configuration for the given board.*

- void [DCM::DeviceControl::DescrCAM\\_Status\\_GetL](#) (in IPS\_Ref\_t CamRef, out DescrCAM\_Status\_List\_t StatusList) raises (TimeOut, OpNotAllowed, OpNotSupported, OpNotSucceeded)

*Retrieves the CAM status and other information.*

- void [DCM::DeviceControl::DescrCAM\\_CLI\\_MMI\\_CLI\\_Cmd](#) (in IPS\_Ref\_t CamRef, in string Request, out string Response) raises (TimeOut, OpNotAllowed, OpNotSupported, OpNotSucceeded)

*Sends a command to the command line interface of a CAM.*

- void [DCM::DeviceControl::DescrCAM\\_Reset](#) (in IPS\_Ref\_t CamRef) raises (TimeOut, OpNotAllowed, OpNotSupported, OpNotSucceeded)

*Resets the CAM.*

- void [DCM::DeviceControl::DescrBISS\\_CfgSetL](#) (in unsigned short BoardNr, in DescrBISS\_Cfg\_List\_t BissConfigList) raises (TimeOut, OpNotAllowed, OpNotSupported, OpNotSucceeded)

*Configure BISS descrambling on the DRD board.*

- void [DCM::DeviceControl::DescrBISS\\_CfgGetL](#) (in IPS\_Ref\_t BissRef, in IPS\_RefTS\_List\_t RefTsFilter, out DescrBISS\_Cfg\_List\_t BissConfigList) raises (TimeOut, OpNotAllowed, OpNotSupported, OpNotSucceeded)

*Retrieve BISS descrambling configuration on the DRD board for one or more transport streams.*

### 8.65.1 Detailed Description

This module contains types, enums and methods related to descrambling on a DRD DVB S2 board.

### 8.65.2 Typedef Documentation

#### 8.65.2.1 typedef sequence<DescrBISS\_Cfg\_t> DCM::DeviceControl::DescrBISS\_Cfg\_List\_t

A sequence of [DescrBISS\\_Cfg\\_t](#).

Definition at line 28777 of file DCM.idl.

#### 8.65.2.2 typedef sequence<DescrCAM\_BackupCfg\_t> DCM::DeviceControl::DescrCAM\_BackupCfg\_List\_t

A sequence of [DescrCAM\\_BackupCfg\\_t](#).

Definition at line 28645 of file DCM.idl.

#### 8.65.2.3 typedef sequence<DescrCAM\_Cfg\_t> DCM::DeviceControl::DescrCAM\_Cfg\_List\_t

Definition at line 28517 of file DCM.idl.

#### 8.65.2.4 typedef sequence<DescrCAM\_Cfg\_V2\_t> DCM::DeviceControl::DescrCAM\_Cfg\_List\_V2\_t

Definition at line 28544 of file DCM.idl.

**8.65.2.5 typedef sequence<DescrCAM\_Status\_t> DCM::DeviceControl::DescrCAM\_Status\_List\_t**

A sequence of [DescrCAM\\_Status\\_t](#).

Definition at line 28706 of file DCM.idl.

**8.65.2.6 typedef sequence<DescrId\_t> DCM::DeviceControl::DescrId\_List\_t**

A list of descrambling resource id's.

Definition at line 28012 of file DCM.idl.

**8.65.2.7 typedef unsigned short DCM::DeviceControl::DescrId\_t**

Identifies a descrambling resource on a board.

This id is used to pass services, TS, EMM's to a descrambling resource.

Definition at line 28009 of file DCM.idl.

**8.65.2.8 typedef sequence<DescrResource\_t> DCM::DeviceControl::DescrResource\_List\_t**

A list of [DescrResource\\_t](#).

Definition at line 28037 of file DCM.idl.

**8.65.2.9 typedef sequence<DescrServiceData\_t> DCM::DeviceControl::DescrServiceData\_List\_t**

A list of [DescrServiceData\\_t](#).

Definition at line 28101 of file DCM.idl.

**8.65.2.10 typedef sequence<DescrSvcConfig\_t> DCM::DeviceControl::DescrSvcConfig\_List\_t**

Definition at line 28454 of file DCM.idl.

**8.65.2.11 typedef sequence<DescrTrackingRule\_t> DCM::DeviceControl::DescrTrackingRuleList\_t**

A sequence of [DescrTrackingRule\\_t](#).

Definition at line 28425 of file DCM.idl.

**8.65.2.12 typedef sequence<DescrTS\_Data\_t> DCM::DeviceControl::DescrTS\_Data\_List\_t**

A sequence of [DescrTS\\_Data\\_t](#) entries.

Definition at line 28214 of file DCM.idl.

**8.65.2.13 typedef sequence<DescrTS\_Data\_V2\_t> DCM::DeviceControl::DescrTS\_Data\_List\_V2\_t**

A sequence of [DescrTS\\_Data\\_V2\\_t](#) entries.

Definition at line 28241 of file DCM.idl.

**8.65.3 Enumeration Type Documentation****8.65.3.1 enum DCM::DeviceControl::eCaPmtListManagement\_t**

Represents how CA PMT lists need to be updated towards the CAM.

**Enumerator:**

*eCaPmtListManagement\_AddDelete* Update (add/delete) single CA PMT only.  
*eCaPmtListManagement\_UpdateAll* Update all CA PMT's.  
*eCaPmtListManagement\_Reserved1*  
*eCaPmtListManagement\_Reserved2*  
*eCaPmtListManagement\_Reserved3*

Definition at line 28520 of file DCM.idl.

**8.65.3.2 enum DCM::DeviceControl::eDescrEnabledMode\_t**

Represents how a service needs to be descrambled.

**Enumerator:**

*eDescrEnabledMode\_Disabled* Descrambling disabled.  
*eDescrEnabledMode\_Service* Service level descrambling enabled.  
*eDescrEnabledMode\_Component* Component level descrambling enabled.  
*eDescrEnabledMode\_Reserved1*  
*eDescrEnabledMode\_Reserved2*  
*eDescrEnabledMode\_Reserved3*

Definition at line 28428 of file DCM.idl.

**8.65.3.3 enum DCM::DeviceControl::eDescrType\_t**

The different descrambling resource types.

**Enumerator:**

*eDescrType\_CAM* DVB descrambling via CAM.  
*eDescrType\_BISS* BISS descrambling. Usually only one per board.  
*eDescrType\_Reserved1*  
*eDescrType\_Reserved2*  
*eDescrType\_Reserved3*

Definition at line 28015 of file DCM.idl.

**8.65.4 Function Documentation**

**8.65.4.1 void DCM::DeviceControl::DescrBISS\_CfgGetL ( in IPS\_Ref\_t *BissRef*, in IPS\_RefTS\_List\_t *RefTsFilter*, out DescrBISS\_Cfg\_List\_t *BissConfigList* ) raises (Timeout, OpNotAllowed, OpNotSupported, OpNotSucceeded)**

Retrieve BISS descrambling configuration on the DRD board for one or more transport streams.

If a wildcard is used for BissRef, the RefTsFilter should be empty.

**Parameters**

|     |                       |                                                       |
|-----|-----------------------|-------------------------------------------------------|
| in  | <i>BissRef</i>        | identifies the BISS descrambler. Wildcard is allowed. |
| in  | <i>RefTsFilter</i>    | if not empty, filter result on list of TS references. |
| out | <i>BissConfigList</i> | list of configuration data                            |

**Exceptions**

|                       |                                                                                                                                                                                                              |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | request timed out.                                                                                                                                                                                           |
| <i>OpNotAllowed</i>   | not logged on.                                                                                                                                                                                               |

| <i>OpNotSucceeded</i> | - invalid reference in RefTsFilter.<br><ul style="list-style-type: none"> <li>• TS ref in RefTsFilter not consistent with BissRef.</li> <li>• Wildcard used in BissRef but RefTsFilter not empty.</li> </ul> |

**Version**

Release 9.10

**8.65.4.2** void DCM::DeviceControl::DescrBISS\_CfgSetL ( in unsigned short *BoardNr*, in DescrBISS\_Cfg\_List\_t *BissConfigList* ) raises (TimeOut, OpNotAllowed, OpNotSupported, OpNotSucceeded)

Configure BISS descrambling on the DRD board.

This consists of defining the session word for BISS descrambling. Currently the session word can only be set per TS.

**Parameters**

|    |                       |                            |
|----|-----------------------|----------------------------|
| in | <i>BoardNr</i>        | identifies the board       |
| in | <i>BissConfigList</i> | list of configuration data |

**Exceptions**

|                       |                                                                                                                                                                               |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | request timed out.                                                                                                                                                            |
| <i>OpNotAllowed</i>   | not logged on.                                                                                                                                                                |
| <i>OpNotSupported</i> | board does not support the operation.                                                                                                                                         |
| <i>OpNotSucceeded</i> | - invalid RefTS provided in BissConfigList (e.g. not BISS).<br><ul style="list-style-type: none"> <li>• invalid SessionWord in BissConfigList (e.g. wrong length).</li> </ul> |

**Version**

Release 9.10

**8.65.4.3** void DCM::DeviceControl::DescrCAM\_BackupCfg\_GetL ( in unsigned short *BoardNr*, out DescrCAM\_BackupCfg\_List\_t *BackupConfigL* ) raises (TimeOut, OpNotAllowed, OpNotSupported, OpNotSucceeded)

Retrieve the CAM backup configuration for the given board.

**Parameters**

|     |                      |                                     |
|-----|----------------------|-------------------------------------|
| in  | <i>BoardNr</i>       | identifies the board.               |
| out | <i>BackupConfigL</i> | list of configuration of CAM pairs. |

**Exceptions**

|                       |                                       |
|-----------------------|---------------------------------------|
| <i>TimeOut</i>        | request timed out.                    |
| <i>OpNotAllowed</i>   | not logged on.                        |
| <i>OpNotSupported</i> | board does not support the operation. |
| <i>OpNotSucceeded</i> | An error occurred.                    |

**Version**

Release 9.0

**8.65.4.4** void DCM::DeviceControl::DescrCAM\_BackupCfg\_SetL ( in unsigned short *BoardNr*, in DescrCAM\_BackupCfg\_List\_t *BackupConfigL* ) raises (TimeOut, OpNotAllowed, OpNotSupported, OpNotSucceeded)

Set backup configuration for one or more CAM pairs.

If backup is enabled, the main and backup CAM function effectively as a CAM pair. The main CAM is used to pass TS, services and EMMs to. Main and backup CAM reside on the same front-end. The first CAM is the main CAM and the second CAM is the backup CAM, similar to GbE port pairs. Backup will always be done in a non-revertive way: once switched to the backup CAM, the main CAM can only be activated manually. Disabling CAM backup lets each CAM work individually again, hence disables the pair mode.

**Parameters**

|    |                      |                                |
|----|----------------------|--------------------------------|
| in | <i>BoardNr</i>       | identifies the board.          |
| in | <i>BackupConfigL</i> | list of backup configurations. |

**Exceptions**

|                       |                                                                                                                                                                                                                                        |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | request timed out.                                                                                                                                                                                                                     |
| <i>OpNotAllowed</i>   | not logged on.                                                                                                                                                                                                                         |
| <i>OpNotSucceeded</i> | - if wrong or an invalid combination of CAMs are provided. <ul style="list-style-type: none"> <li>• if backup CAM already has TS, services, EMMs routed to it.</li> <li>• if MainCAM is not the first CAM on the front-end.</li> </ul> |
| <i>OpNotSupported</i> | board does not support the operation.                                                                                                                                                                                                  |

**Version**

Release 9.0

**8.65.4.5** void DCM::DeviceControl::DescrCAM\_CfgGetL ( in IPS\_Ref\_t *CamRef*, out DescrCAM\_Cfg\_List\_t *ConfigList* ) raises (TimeOut, OpNotAllowed, OpNotSupported, OpNotSucceeded)

Retrieves the configuration of one or more CAMs.

**Parameters**

|     |                   |                                              |
|-----|-------------------|----------------------------------------------|
| in  | <i>CamRef</i>     | identifies the CAM. Wildcard is allowed.     |
| out | <i>ConfigList</i> | CAM configuration list (only CAMs included). |

**Exceptions**

|                       |                                                       |
|-----------------------|-------------------------------------------------------|
| <i>TimeOut</i>        | request timed out.                                    |
| <i>OpNotAllowed</i>   | not logged in                                         |
| <i>OpNotSupported</i> | if board does not support this function.              |
| <i>OpNotSucceeded</i> | - invalid CamRef.<br>• no CAM found for given CamRef. |

**Version**

Release 9.0

**Deprecated** Since release 12.0, use DescrCAM\_CfgGetL\_V2 instead

**8.65.4.6** void DCM::DeviceControl::DescrCAM\_CfgGetL\_V2 ( in IPS\_Ref\_t *CamRef*, out DescrCAM\_Cfg\_List\_V2\_t *ConfigList* ) raises (TimeOut, OpNotAllowed, OpNotSupported, OpNotSucceeded)

Retrieves the configuration of one or more CAMs.

**Parameters**

|     |                   |                                              |
|-----|-------------------|----------------------------------------------|
| in  | <i>CamRef</i>     | identifies the CAM. Wildcard is allowed.     |
| out | <i>ConfigList</i> | CAM configuration list (only CAMs included). |

**Exceptions**

|                       |                                                       |
|-----------------------|-------------------------------------------------------|
| <i>TimeOut</i>        | request timed out.                                    |
| <i>OpNotAllowed</i>   | not logged in                                         |
| <i>OpNotSupported</i> | if board does not support this function.              |
| <i>OpNotSucceeded</i> | - invalid CamRef.<br>• no CAM found for given CamRef. |

**Version**

Release 12.0

**8.65.4.7** void DCM::DeviceControl::DescrCAM\_CfgSetL ( in unsigned short *BoardNr*, in DescrCAM\_Cfg\_List\_t *ConfigList* ) raises (TimeOut, OpNotAllowed, OpNotSupported, OpNotSucceeded, LicenseError)

Configures one or more CAMs.

Enabling a CAM requires a license. If the license is not available, a LicenseError is returned and the CAM setting stays disabled. Note: when licenses are reduced and the DCM is rebooted, only CAMs for which a license is available will be enabled. The enabled setting is still enabled in that case but the enabled status will be disabled and a license alarm is triggered. Disabling the CAM will clear the license alarm. This function is executed in a best-effort way (up to the first encountered error).

**Parameters**

|    |                   |                            |
|----|-------------------|----------------------------|
| in | <i>BoardNr</i>    | identifies the board       |
| in | <i>ConfigList</i> | list of CAM configurations |

**Exceptions**

|                       |                                                                        |
|-----------------------|------------------------------------------------------------------------|
| <i>TimeOut</i>        | request timed out.                                                     |
| <i>OpNotAllowed</i>   | not logged in                                                          |
| <i>OpNotSupported</i> | if board does not support this function.                               |
| <i>OpNotSucceeded</i> | - invalid parameters in ConfigList.<br>• invalid CamRef in ConfigList. |
| <i>LicenseError</i>   | CAM license not available.                                             |

**Version**

Release 9.0

**Deprecated** Since release 12.0, use DescrCAM\_CfgSetL\_V2 instead

**8.65.4.8** void DCM::DeviceControl::DescrCAM\_CfgSetL\_V2 ( in unsigned short *BoardNr*, in DescrCAM\_Cfg\_List\_V2\_t *ConfigList* ) raises (TimeOut, OpNotAllowed, OpNotSupported, OpNotSucceeded, LicenseError)

Configures one or more CAMs.

Enabling a CAM requires a license. If the license is not available, a LicenseError is returned and the CAM setting stays disabled. Note: when licenses are reduced and the **DCM** is rebooted, only CAMs for which a license is available will be enabled. The enabled setting is still enabled in that case but the enabled status will be disabled and a license alarm is triggered. Disabling the CAM will clear the license alarm. This function is executed in a best-effort way (up to the first encountered error).

**Parameters**

|    |                   |                            |
|----|-------------------|----------------------------|
| in | <i>BoardNr</i>    | identifies the board       |
| in | <i>ConfigList</i> | list of CAM configurations |

**Exceptions**

|                       |                                                                        |
|-----------------------|------------------------------------------------------------------------|
| <i>TimeOut</i>        | request timed out.                                                     |
| <i>OpNotAllowed</i>   | not logged in                                                          |
| <i>OpNotSupported</i> | if board does not support this function.                               |
| <i>OpNotSucceeded</i> | - invalid parameters in ConfigList.<br>• invalid CamRef in ConfigList. |
| <i>LicenseError</i>   | CAM license not available.                                             |

**Version**

Release 12.0

**8.65.4.9** void DCM::DeviceControl::DescrCAM\_CI\_MMI\_CLI\_Cmd ( in IPS\_Ref\_t *CamRef*, in string *Request*, out string *Response* ) raises (TimeOut, OpNotAllowed, OpNotSupported, OpNotSucceeded)

Sends a command to the command line interface of a CAM.

Commands are CAM specific. Request is string where command and parameters are separated by SPACE. Response is a string, including in EOL markers. Supported commands:

- menu description : open a menu on a CAM
- choice [param] description : make a menu choice
- close description : close the menu

#### Parameters

|     |                 |                                        |
|-----|-----------------|----------------------------------------|
| in  | <i>CamRef</i>   | Identifies the CAM.                    |
| in  | <i>Request</i>  | The request string to send to the CAM. |
| out | <i>Response</i> | The response of the CAM.               |

#### Exceptions

|                       |                                                   |
|-----------------------|---------------------------------------------------|
| <i>TimeOut</i>        | request timed out.                                |
| <i>OpNotAllowed</i>   | not logged in.                                    |
| <i>OpNotSupported</i> | if board does not support this function.          |
| <i>OpNotSucceeded</i> | invalid CamRef provided or no matching CAM found. |

#### Version

Release 9.10

**8.65.4.10** void DCM::DeviceControl::DescrCAM\_Reset ( in IPS\_Ref\_t *CamRef* ) raises (TimeOut, OpNotAllowed, OpNotSupported, OpNotSucceeded)

Resets the CAM.

#### Parameters

|    |               |                     |
|----|---------------|---------------------|
| in | <i>CamRef</i> | Identifies the CAM. |
|----|---------------|---------------------|

#### Exceptions

|                       |                                                   |
|-----------------------|---------------------------------------------------|
| <i>TimeOut</i>        | request timed out.                                |
| <i>OpNotAllowed</i>   | not logged in.                                    |
| <i>OpNotSupported</i> | if board does not support this function.          |
| <i>OpNotSucceeded</i> | invalid CamRef provided or no matching CAM found. |

#### Version

Release 9.0

**8.65.4.11** void DCM::DeviceControl::DescrCAM\_Status\_GetL ( in IPS\_Ref\_t *CamRef*, out DescrCAM\_Status\_List\_t *StatusList* ) raises (TimeOut, OpNotAllowed, OpNotSupported, OpNotSucceeded)

Retrieves the CAM status and other information.

#### Parameters

|     |                   |                                          |
|-----|-------------------|------------------------------------------|
| in  | <i>CamRef</i>     | identifies the CAM. Wildcard is allowed. |
| out | <i>StatusList</i> | list of status information.              |

#### Exceptions

|                       |                                                   |
|-----------------------|---------------------------------------------------|
| <i>TimeOut</i>        | request timed out.                                |
| <i>OpNotAllowed</i>   | not logged in                                     |
| <i>OpNotSupported</i> | if board does not support this function.          |
| <i>OpNotSucceeded</i> | invalid CamRef provided or no matching CAM found. |

#### Version

Release 9.0

**8.65.4.12** void DCM::DeviceControl::DescrEMM\_AddL ( in IPS\_Ref\_t *DescramblerRef*, in IPS\_RefPidList\_t *EmmList* ) raises (TimeOut, OpNotSucceeded, OpNotSupported, OpNotAllowed)

Add one or more EMM to a descrambler.

Only CAMs support adding EMMs.

#### Parameters

|    |                        |                                               |
|----|------------------------|-----------------------------------------------|
| in | <i>Descrambler-Ref</i> | Identifies the descrambler (should be a CAM). |
| in | <i>EmmList</i>         | References of the input EMMs to pass.         |

#### Exceptions

|                       |                                                                                                                                                                                                   |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | a timeout occurred during IIOP processing                                                                                                                                                         |
| <i>OpNotAllowed</i>   | not logged in                                                                                                                                                                                     |
| <i>OpNotSupported</i> | if board does not support this function.                                                                                                                                                          |
| <i>OpNotSucceeded</i> | - invalid references are used. <ul style="list-style-type: none"> <li>• EmmList is empty.</li> <li>• DescramblerRef does not correspond to a CAM.</li> <li>• EMM already added to CAM.</li> </ul> |

Release 9.0

**8.65.4.13** void DCM::DeviceControl::DescrEMM\_DeleteL ( in unsigned short *BoardNr*, in IPS\_RefPidList\_t *EmmList* ) raises (TimeOut, OpNotSucceeded, OpNotSupported, OpNotAllowed)

Deletes one or more EMMs routed to a CAM.

The EMMs in the list can belong to different CAMs.

**Parameters**

|    |                |                                  |
|----|----------------|----------------------------------|
| in | <i>BoardNr</i> | identifies the board             |
| in | <i>EmmList</i> | references of EMMs to be deleted |

**Exceptions**

|                       |                                                   |
|-----------------------|---------------------------------------------------|

| <i>OpNotAllowed</i>   | not logged in                                     |
| <i>OpNotSupported</i> | if board does not support this function.          |
| <i>OpNotSucceeded</i> | one of the EMMs was not found, invalid board ref. |

**Version**

Release 9.0

**8.65.4.14** void DCM::DeviceControl::DescrEMM\_GetL ( in IPS\_Ref\_t *DescramblerRef*, out IPS\_RefPidList\_t *EmmList* ) raises (TimeOut, OpNotSucceeded, OpNotSupported, OpNotAllowed)

Retrieve the list of EMMs routed to a CAM.

**Parameters**

|     |                        |                                                  |
|-----|------------------------|--------------------------------------------------|
| in  | <i>Descrambler-Ref</i> | identifies the descrambler. Wildcard is allowed. |
| out | <i>EmmList</i>         | list of references of found EMMs.                |

**Exceptions**

|                       |                                                             |
|-----------------------|-------------------------------------------------------------|
| <i>TimeOut</i>        | a timeout occurred during IIOP processing                   |
| <i>OpNotAllowed</i>   | not logged in                                               |
| <i>OpNotSupported</i> | if board does not support this function.                    |
| <i>OpNotSucceeded</i> | - invalid DescramblerRef or not matching descrambler found. |

**Version**

Release 9.0

**8.65.4.15** void DCM::DeviceControl::DescrResourceGetL ( in unsigned short *BoardNr*, out DescrResource\_List\_t *DescrResourceList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Retrieve the list of available descrambling resources for a given board.

**Parameters**

|     |                           |                                           |
|-----|---------------------------|-------------------------------------------|
| in  | <i>BoardNr</i>            | identifies the board.                     |
| out | <i>Descr-ResourceList</i> | list of available descrambling resources. |

**Exceptions**

|                       |                                        |
|-----------------------|----------------------------------------|
| <i>TimeOut</i>        | IDL request timed out                  |
| <i>OpNotAllowed</i>   | Not logged in.                         |
| <i>OpNotSupported</i> | Board does not support this operation. |
| <i>OpNotSucceeded</i> | Processing error.                      |

**Version**

Release 9.0

**8.65.4.16** void DCM::DeviceControl::DescrResourceSetL ( in unsigned short *BoardNr*, in DescrResource\_List\_t *ConfigList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Configure the name of one or more descrambling resources.

When an empty string is provided as name, the name will be reverted to the default value.

**Parameters**

|     |                   |                                                                                                                          |
|-----|-------------------|--------------------------------------------------------------------------------------------------------------------------|
| in  | <i>BoardNr</i>    | identifies the board.                                                                                                    |
| out | <i>ConfigList</i> | list containing the names of the descrambling resources. Only the Name field in <a href="#">DescrResource_t</a> is used. |

**Exceptions**

|                       |                                                                                                                                                                   |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | IDL request timed out.                                                                                                                                            |
| <i>OpNotAllowed</i>   | Not logged in.                                                                                                                                                    |
| <i>OpNotSupported</i> | Board does not support this operation.                                                                                                                            |
| <i>OpNotSucceeded</i> | - Names are not unique across the board. <ul style="list-style-type: none"> <li>• Mismatch between DescrId and Ref.</li> <li>• Invalid DescrId or Ref.</li> </ul> |

**Version**

Release 9.0

**8.65.4.17** void DCM::DeviceControl::DescrServiceAddL ( in IPS\_Ref\_t *DescramblerRef*, in IPS\_RefSvc\_List\_t *InputRefSvcList*, out IPS\_RefSvc\_List\_t *CreatedServicesL* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Add a list of services to a descrambling resource.

In case of an error the created services list can contain a partial result, e.g. a number of services has been created. It is up to the client to implement a roll-back and delete the services if necessary.

**Parameters**

|     |                          |                                                  |
|-----|--------------------------|--------------------------------------------------|
| in  | <i>Descrambler-Ref</i>   | identifies the descrambling resource.            |
| in  | <i>InputRefSvcList</i>   | list of RefSvc of the (IO board) input services. |
| out | <i>Created-ServicesL</i> | list of created services.                        |

**Exceptions**

|                       |                                                                                                                                                                                                                                                             |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | a timeout occurred during IIOP processing                                                                                                                                                                                                                   |
| <i>OpNotSucceeded</i> | - invalid references are used <ul style="list-style-type: none"> <li>• one of the input services already has been added.</li> <li>• a TS in SFN/TS mode already is added to a CAM descrambling resource.</li> <li>• invalid DescrId is provided.</li> </ul> |
| <i>OpNotAllowed</i>   | not logged in                                                                                                                                                                                                                                               |
| <i>OpNotSupported</i> | if board does not support this function.                                                                                                                                                                                                                    |

**Version**

Release 9.0

**8.65.4.18** void DCM::DeviceControl::DescrServiceDeleteL ( in unsigned short *BoardNr*, in IPS\_RefSvc\_List\_t *RefSvcList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Removes a list of services from a descrambling resource.

There can be conditions preventing deletion of the service, such as passed to output, being part of a TS in SFN/TS mode (and present at the input PAT)... A property bit in struct [DescrServiceData\\_t](#) indicates whether the service can be deleted. This function is executed in a best effort way: services might be deleted partially in case an error occurs.

**Parameters**

|    |                   |                                                                                                                |
|----|-------------------|----------------------------------------------------------------------------------------------------------------|
| in | <i>BoardNr</i>    | identifies the board.                                                                                          |
| in | <i>RefSvcList</i> | a list of services to delete. Use the RefSvc field of the <a href="#">DescrServiceData_t</a> for this purpose. |

**Exceptions**

|                       |                                                                                                                                                                                                                                     |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | a timeout occurred during IIOP processing                                                                                                                                                                                           |
| <i>OpNotSucceeded</i> | - Invalid references are used (RefSvcList). <ul style="list-style-type: none"> <li>Inconsistency between BoardNr &amp; RefSvcList[x].Ref.PhysRef.BoardNr.</li> <li>The service cannot be deleted, e.g. passed to output.</li> </ul> |
| <i>OpNotAllowed</i>   | not logged in                                                                                                                                                                                                                       |
| <i>OpNotSupported</i> | if board does not support this function.                                                                                                                                                                                            |

**Version**

Release 9.0

**8.65.4.19** void DCM::DeviceControl::DescrServiceGetL ( in IPS\_Ref\_t *DescramblerRef*, in IPS\_RefSvc\_List\_t *RefSvcList*, out DescrServiceData\_List\_t *ServiceList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the list of services on a descrambling resource.

If a wildcard is used for DescramblerRef.PortNr, the RefSvcList should be empty.

**Parameters**

|     |                        |                                                                                                                                        |
|-----|------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| in  | <i>Descrambler-Ref</i> | identifies the descrambling resource. Wildcard allowed.                                                                                |
| in  | <i>RefSvcList</i>      | list of RefSvc of the descrambler services for which to return the service data. For an empty list, data of all services are returned. |
| out | <i>ServiceList</i>     | List of ProcServiceDataDescrServiceData_t entries                                                                                      |

**Exceptions**

|                       |                                                                                                                                                                                                                                                                                |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing                                                                                                                                                                                                                                      |
| <i>OpNotAllowed</i>   | not logged in                                                                                                                                                                                                                                                                  |
| <i>OpNotSupported</i> | if board does not support this function.                                                                                                                                                                                                                                       |
| <i>OpNotSucceeded</i> | - invalid or inconsistent references are used in RefSvcList. <ul style="list-style-type: none"> <li>wildcard used for PortNr and RefSvcList is not empty.</li> <li>inconsistency in BoardNr or PortNr between DescramblerRef and one of the elements in RefSvcList.</li> </ul> |

**Version**

Release 9.0

**8.65.4.20** void DCM::DeviceControl::DescrServiceSetL ( in unsigned short *BoardNr*, in DescrServiceData\_List\_t *ServiceDataList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set service details of services on a descrambler.

Only the UserTag is currently settable.

**Parameters**

|    |                         |                                                                                                  |
|----|-------------------------|--------------------------------------------------------------------------------------------------|
| in | <i>BoardNr</i>          | identifies the board.                                                                            |
| in | <i>ServiceData-List</i> | list of <a href="#">DescrServiceData_t</a> specifying the service data details for modification. |

**Exceptions**

|                       |                                                                                                                                                                                                  |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing                                                                                                                                                        |
| <i>OpNotAllowed</i>   | not logged in                                                                                                                                                                                    |
| <i>OpNotSupported</i> | if board does not support this function.                                                                                                                                                         |
| <i>OpNotSucceeded</i> | - invalid references are used, UserTag already used,<br><ul style="list-style-type: none"> <li>inconsistency between BoardNr and BoardNr in one of the elements of - ServiceDataList.</li> </ul> |

**Version**

Release 9.0

**8.65.4.21** void DCM::DeviceControl::DescrSvcConfigGetL ( in IPS\_Ref\_t *DescramblerRef*, in IPS\_RefSvc\_List\_t *SvcFilter*, out DescrSvcConfig\_List\_t *ConfigList* ) raises (TimeOut, OpNotAllowed, OpNotSupported, OpNotSucceeded)

Returns the services / PIDs for which descrambling is configured.

If a wildcard is used for DescramblerRef.PortNr, the SvcFilter should be empty.

**Parameters**

|     |                        |                                                      |
|-----|------------------------|------------------------------------------------------|
| in  | <i>Descrambler-Ref</i> | identifies the descrambler. Wildcard allowed.        |
| in  | <i>SvcFilter</i>       | if non-empty, limit result to services in this list. |
| out | <i>ConfigList</i>      | list of descrambling configurations per service.     |

**Exceptions**

|                       |                                                                                                                                                                                                                                                                                                          |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | request timed out.                                                                                                                                                                                                                                                                                       |
| <i>OpNotAllowed</i>   | not logged in                                                                                                                                                                                                                                                                                            |
| <i>OpNotSupported</i> | if board does not support this function.                                                                                                                                                                                                                                                                 |
| <i>OpNotSucceeded</i> | - invalid DescramblerRef or no matching descrambler found.<br><ul style="list-style-type: none"> <li>invalid reference in SvcFilter.</li> <li>inconsistency in PortNr between DescramblerRef and element in SvcFilter.</li> <li>wildcard for DescramblerRef.PortNr &amp; SvcFilter not empty.</li> </ul> |

**Version**

Release 9.0

**8.65.4.22** void DCM::DeviceControl::DescrSvcConfigSetL ( in unsigned short *BoardNr*, in DescrSvcConfig\_List\_t *ConfigList* ) raises (TimeOut, OpNotAllowed, OpNotSupported, OpNotSucceeded)

Start descrambling on services / components on the specified virtual TS.

**Parameters**

|    |                   |                                                 |

| <i>OpNotAllowed</i>   | not logged on.                                                                                                                                                                                                                                                                                               |
| <i>OpNotSupported</i> | board does not support the operation.                                                                                                                                                                                                                                                                        |
| <i>OpNotSucceeded</i> | - if ConfigList contains invalid reference or Pid. <ul style="list-style-type: none"> <li>• if an error occurred during configuration of descrambling.</li> <li>• if comp. level descrambling is configured with empty list.</li> <li>• if invalid or unsupported tracking criterium is provided.</li> </ul> |

**Version**

Release 9.0

**8.65.4.23** void DCM::DeviceControl::DescrTS\_Add ( in IPS\_Ref\_t *DescramblerRef*, in IPS\_RefTS\_t *RefTsIn*, out IPS\_RefTS\_t *CreatedTs* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Add a TS to a descrambler.

**Parameters**

|     |                        |                                       |
|-----|------------------------|---------------------------------------|
| in  | <i>Descrambler-Ref</i> | identifies the descrambling resource. |
| in  | <i>RefTsIn</i>         | reference of input TS to pass.        |
| out | <i>CreatedTs</i>       | reference of the created TS.          |

**Exceptions**

|                       |                                                                                                                                                                                                              |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeOut</i>        | a timeout occurred during IIOP processing                                                                                                                                                                    |
| <i>OpNotSucceeded</i> | - invalid DescramblerRef or RefTsIn. <ul style="list-style-type: none"> <li>• other TS, service or EMM already passed to a CAM.</li> <li>• same input TS already passed to the given descrambler.</li> </ul> |
| <i>OpNotAllowed</i>   | not logged in                                                                                                                                                                                                |
| <i>OpNotSupported</i> | if board does not support this function.                                                                                                                                                                     |

**Version**

Release 9.10

**8.65.4.24** void DCM::DeviceControl::DescrTS\_DeleteL ( in unsigned short *BoardNr*, in IPS\_RefTS\_List\_t *RefTsList* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Remove one or more TS's from a descrambler.

The TS can only be deleted if the TS (or part of it) is not passed to an IO board. This function is executed in a best effort way, meaning that possibly not all TS are deleted.

**Parameters**

|    |                  |                                                                       |
|----|------------------|-----------------------------------------------------------------------|
| in | <i>BoardNr</i>   | identifies the board.                                                 |
| in | <i>RefTsList</i> | list of TS references, as assigned by <a href="#">DescrTS_Add()</a> . |

**Exceptions**

|                       |                                                                             |
|-----------------------|-----------------------------------------------------------------------------|
| <i>OpNotSucceeded</i> | - Invalid TS reference, TS reference not found.<br>• passed to an IO board. |
| <i>OpNotAllowed</i>   | not logged in.                                                              |
| <i>OpNotSupported</i> | if board does not support this function.                                    |

**Version**

Release 9.10

**8.65.4.25** void DCM::DeviceControl::DescrTS\_GetL ( in unsigned short *BoardNr*, in IPS\_RefTS\_List\_t *RefTsList*, out DescrTS\_Data\_List\_t *TsDataList* ) raises (Timeout, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Get the list of transport streams passed to a descrambler board.

**Parameters**

|     |                   |                                                                                                                                 |
|-----|-------------------|---------------------------------------------------------------------------------------------------------------------------------|
| in  | <i>BoardNr</i>    | number of the board.                                                                                                            |
| in  | <i>RefTsList</i>  | list of RefTs of the descrambler services for which to return the TS data.<br>For an empty list, data of all TS's are returned. |
| out | <i>TsDataList</i> | list of <a href="#">DescrTS_Data_t</a> entries.                                                                                 |

**Exceptions**

|                       |                                           |
|-----------------------|-------------------------------------------|
| <i>Timeout</i>        | A timeout occurred during IIOP processing |
| <i>OpNotAllowed</i>   | not logged in                             |
| <i>OpNotSupported</i> | if board does not support this function.  |
| <i>OpNotSucceeded</i> | invalid references are used               |

**Version**

Release 9.10

**Deprecated** Since Release 12.0, use DescrTS\_GetL\_V2 instead

**8.65.4.26** void DCM::DeviceControl::DescrTS\_GetL\_V2 ( in unsigned short *BoardNr*, in IPS\_RefTS\_List\_t *RefTsList*, out DescrTS\_Data\_List\_V2\_t *TsDataList* ) raises (TimeOut, OperationFailed, OpNotAllowed, OpNotSupported)

Get the list of transport streams passed to a descrambler board.

**Parameters**

|     |                   |                                                                                                                                                              |
|-----|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in  | <i>BoardNr</i>    | number of the board.                                                                                                                                         |
| in  | <i>RefTsList</i>  | list of RefTs of the descrambler services for which to return the TS data. For an empty list, data of all TS's are returned. Wildcard is allowed for TS ref. |
| out | <i>TsDataList</i> | list of <a href="#">DescrTS_Data_V2_t</a> entries.                                                                                                           |

**Exceptions**

|                        |                                           |
|------------------------|-------------------------------------------|
| <i>TimeOut</i>         | A timeout occurred during IIOP processing |
| <i>OpNotAllowed</i>    | not logged in                             |
| <i>OpNotSupported</i>  | if board does not support this function.  |
| <i>OperationFailed</i> | in case invalid references are used       |

**Note**

- An empty RefList means all refs.

**Version**

Release 12.0

**8.65.4.27** void DCM::DeviceControl::DescrTS\_SetL ( in unsigned short *BoardNr*, in DescrTS\_Data\_List\_t *TsDataList* ) raises (TimeOut, OpNotSucceeded, OpNotAllowed, OpNotSupported)

Set TS details of one or more TS's on a descrambler.

Only the UserTag is currently settable.

**Parameters**

|    |                   |                                |
|----|-------------------|--------------------------------|
| in | <i>BoardNr</i>    | identifies the board.          |
| in | <i>TsDataList</i> | list of TS configuration data. |

**Exceptions**

|                       |                                           |
|-----------------------|-------------------------------------------|
| <i>TimeOut</i>        | A timeout occurred during IIOP processing |
| <i>OpNotAllowed</i>   | not logged in                             |
| <i>OpNotSupported</i> | if board does not support this function.  |

|                       |                                                  |
|-----------------------|--------------------------------------------------|
| <i>OpNotSucceeded</i> | invalid references are used, duplicate UserTags. |
|-----------------------|--------------------------------------------------|

**Version**

Release 9.10

**Deprecated** Since Release 12.0, user DescrTS\_SetL\_V2 instead

**8.65.4.28** void DCM::DeviceControl::DescrTS\_SetL\_V2 ( in unsigned short *BoardNr*, in DescrTS\_Data\_List\_V2\_t *TsDataList* ) raises (TimeOut, OperationFailed, OpNotAllowed, OpNotSupported)

Set TS details of one or more TS's on a descrambler.

Only the UserTag and TransparentSI flag are currently settable.

**Parameters**

|    |                   |                                |
|----|-------------------|--------------------------------|
| in | <i>BoardNr</i>    | identifies the board.          |
| in | <i>TsDataList</i> | list of TS configuration data. |

**Exceptions**
